LIBRARY
UNIVERSITY OF ILLINOIS
URBANA

THE ARCHITECTS' & BUILDERS' JOURNAL.

A Weekly Journal for Architects Surveyors Builders and Constructional Engineers.

It is our aim, our ambition, our aspiration even, to build our Journal worthily and well not for the hour only, but for future years; for the few men in the forefront of an enduring and a laborious art; for the disciplined ranks of a distinguished profession; for the young men—Architects to be—and for all who love a clustered column or a flying buttress, a traceried window or a Greek frieze; for the man, too, who honestly plumbs a jamb. . . . . .

CAXTON HOUSE, WESTMINSTER.

CONTENTS.

See also Concrete and Steel Section.

ABBEY, THE RESTORATION OF SELBY, 21.
Aberdeen: Architectural Association, 471; Statuary, 643.
Abolition of White Lead, The, 218.

Fore and Aft.

The year that is past has shown a scarcely perceptible improvement on the stagnation of business that has been for so long prevalent. It was a year of bad trade and, in this country, of political unrest, which made matters much worse than they need have been. Anxious as we are to keep clear of political partisanship, we cannot shut our eyes to the plain fact that the Budget proposals with regard to land have had a most sinister influence in quashing, in postponing, or in otherwise seriously restricting building operations. That is palpably the immediate result; what the ultimate effect may be, supposing that those proposals are approved by the country, we do not pretend to prophesy. Our one hope is that the verdict, one way or the other, may be so signal and decisive as to put an end to the suspense that is notoriously more distressing than the realisation of the worst that can happen. One outstanding feature of the past year upon which we think that the building trade is justly entitled to congratulate itself is its splendid optimism. In spite of the most depressing conditions, in spite of heart-sickening hope deferred, there has been no whimpering and whining; but, instead, a fine manly exhibition of courage and fortitude. Adversity has been met in the right spirit of dogged British pluck and endurance. For our part, we have done all in our power to encourage this spirit, not merely because it is an admirable thing it itself, but also because it is actively remedial. We believe it to be a literal truth that in the battle of life "Fortune favours the brave," and that, on the other hand, evil forebodings have a deadly tendency to materialise. It is for these reasons that in the volume of the "Builders' Journal" just closed the search for anything in the nature of a genuine jeremiad would be perfectly vain. Not that we have emulated the folly of the ostrich. We have had to chronicle many unpalatable facts; but we have consistently refused to allow them either to be magnified by the faint-hearted or to be exploited for political purposes by those who seem to be more interested in vote-catching than genuinely concerned for the welfare of our country. We are, in short, convinced of the strength of moral effect; and, therefore, as it is the aim of this journal to promote in every way the best interests of all who are engaged in the great industry of building, we conceive it to be our duty to discountenance every tendency to depress, and to foster every element of firmness and courage. We confidently anticipate that during the year that has just begun, there will be much less need for strenuous Mark Tapleyism. Prosperity is coming along, not in leaps and bounds, but with sure and steady steps, and it will arrive, we firmly believe, in good time to make 1910 the beginning of a new cycle of profitable activity. We sincerely congratulate the entire fraternity of builders—the professional men, the contractors, the merchants, and even the operatives—upon their firmness and patience in adversity. Their all-round courage and optimism have been really splendid, and will, we hope, reap, ere the year is out, a fitting reward, so that, at its close, we may have the very great satisfaction of offering our congratulations upon material as well as upon moral grounds: which is equivalent to saying what we now venture to express in so many words, that we wish most heartily to all whose interests it is our business and our pleasure to represent, a Happy and Prosperous New Year!

The Salting Bequest.

Of the several methods of achieving immortality, that of the collector of "articles of bigotry and virtue" is probably the most inoffensive. Nor is lasting fame in this kind cheap or easy of acquisition. The late Mr. George Salting, who died a week or so ago, spent a lifetime and a large fortune in the acquisition of antiquities; and he has extended and perpetuated his fame as a collector, and added to it something of the lustre of a public benefaction, by bequeathing to the nation the objects acquired at so much expense, and selected with so much discrimination. These fill, at the Victoria and Albert Museum, about eighty cases, of which twenty-nine contain Oriental porcelain, while ten cases show Italian majolica, and ten more are given up to Italian bronzes and reliefs. These figures, representing about two-thirds of the total number of the museum cases, may be taken as a tolerably clear indication of the collector's bent. Apparently his main pursuit was Oriental porcelain, with Italian majolica and bronzes as alternative or relief hobbies, while the miscellaneous objects which make up the minor portion of the collection perhaps came across his path more or less casually. A cynic has said that the collection contains "an unusual proportion of authentic specimens"; and there can be no doubt that Mr. Salting was uncommonly difficult to deceive. That he was occasionally beset by grave misgivings as to the genuineness of some of his purchases is a proof of the extraordinary skill of the manufacturers of sham antiques, whose wares are often so cunningly contrived as to deceive the very elect, among whom Mr. Salting was certainly counted.

The Craze for Curios.

Because of the shams, and upon other considerations, there has been lately observed a revival of the disposition to regard collectors of antiquities as the enemies of modern art. It is complained against them that they favour what is curious rather than what is of intrinsic artistic merit, and that, by bringing ancient and modern into unnatural competition, they divert considerable wealth and interest and influence from the art of to-day, thus devoting to traffic in what is over and done such resources as might be more advantageously bestowed on what is or should be a-doing. There seems, however, to be but little strength in the inference that if this money were spent on antiques, more would be dedicated to modern art, and while it must be admitted that the moral effect of antique-hunting is rather discouraging to the modern artist, yet, on a reasoned view, from which all envy and bitterness are strictly excluded, it may be supposed that the manifestation of interest in art of any kind or of any date is a tribute to the value of art at large. For even granting that most of "the things that they put in museums"—that is, those of them that are shaped by the hand of man—are not conspicuously artistic, but are frankly preserved as "curiosities," they nevertheless show in themselves some attempt towards art, and the bare fact of their collection may be taken as indicating some degree of appreciation of that attempt.

Inflated Values.

Curio-collecting, in fact, seems to be grafted on an estimable root principle, which, however, is apt to produce unseemly and undesirable offshoots. Moreover, it certainly may be supposed to set up a false standard of values. The Salting collection is estimated to be worth from two to four millions sterling. As a matter of comparison, the estimate seems to be utterly preposterous. True, a thing may be, as a matter of price, "worth what it will fetch"; but, on a same view of the inflated value of useless articles of bronze and bric-a-

brac, and so forth, preserved in glass cases to be looked at, and offering a bare recompense to the casual glance, and on a consideration of the outcry that is nearly always raised against the proposed expenditure of a few thousands on the erection of some noble public building, which is destined to high utility, and also to impress generations of citizens with a stimulating sense of service, beauty, and dignity one cannot help thinking that a public which calmly acquiesces in the one case and is sordidly recalcitrant in the other, shows much the same sort of mental perversity as that which is said to have characterised Mr. Salting himself, who, immediately after spending six thousand guineas on a bronze, thought that sixpence was an ample price to pay for a cake with which to entertain a lady guest at tea! But the nation gets the collection for nothing; which is perhaps a shade or so nearer its true value than that exaggerated estimate of four millions sterling. It is good to appreciate what is old and rare, and to cherish what is worth preserving; but such generous emotions should be kept well within the bounds of sanity and moderation, lest they lead to consequent error in undervaluing what is new and comparatively common.

Training Colleges and the New Spirit.

The fine buildings of Leeds are, it is to be hoped, about to be augmented by a notable addition. The City Corporation, it is announced, have determined to erect, in Beckett's Park, a training college, which, with its eight hostels, is estimated to cost £130,000. This is to build nobly, if expenditure may be regarded as a criterion. The Leeds Town Hall, designed by Mr. Brodrick, and one of the finest in the kingdom, did not cost much more; but it was built some forty years ago, when labour was decidedly cheaper, and materials also were probably, on the whole, less dear. But, in any case, £130,000 is a handsome sum to spend on a training college. Nor should it be begrudged for such an object. A handsome and dignified building is not only a splendid asset for a city, giving it tone and character, and increasing the self-respect of the citizen and the awe of the alien, to the no small advancement of interest and commodity, but it is also an agent of liberal education, and a monument to the enlightened views of education which have long distinguished the people of Leeds, whence have sprung an astonishingly large proportion of the nation's very best elementary teachers. Hitherto the training colleges of England have been—with perhaps the solitary exception of the costly London Day Training College in Southampton Row, which, however, is partly a school of arts and crafts—run up in a niggardly spirit that suggests an almost fatal misconception either of the supreme importance of elementary education or of the necessity—we do not think the word a whit too strong—of suitably embodying a noble ideal in a worthy building. Many of the colleges—for instance, Whitelands at Chelsea, the Goldsmiths' at New Cross, and Avery Hill, Eltham—have been adapted from buildings that were originally intended for other purposes; and in the majority of those that were specially built there is very little that is suggestive of the Grand Manner. Some of the earlier buildings are rather reminiscent of the charity school view of national education—buildings that are mean and soulless. To Leeds belongs the signal honour of setting a magnificent example to the rest of the country, and we trust that their public spirit will result in a building that will be in every way worthy of their splendid spirit, and that other cities may thereby take courage to follow so notable an example.

Councils of Architecture.

Mr. Cass Gilbert, whose name is much better known in this country since the illustration of some of his works in this journal and in the "Architectural Review," delivered an interesting address as retiring president of the American Institute of Architects, at the forty-third annual convention of that body, which was held at the New Willard Hotel, Washington, D.C., on December 14th-16th. Referring to the Executive Order of President Roosevelt, under date January 19th, 1909, creating a Council of Fine Arts, as an outgrowth of discussions at the 1908 Convention, Mr. Gilbert said that further developments were being mooted. It has been urged that the Institute should advocate, in place of the Council, a Department of Public Works, under which would be placed the construction, adornment, and maintenance of all public buildings, bridges, parks, and roadways. "Such a department," he said, "co-ordinating the functions of both structural and artistic design, would seem to be justified by the vast extent of the Government's enterprises; but the exact method by which the general result should be obtained is of comparatively minor importance." The time seems to be ripe for advocating some such reform in this country. Indeed, the Town Planning Act places more power in the hands of a central authority than would perhaps be possible in the United States; and it therefore becomes highly necessary to arrange that that power shall be judiciously exercised. To this end it is necessary that full use shall be made of the best available advice; and perhaps, to echo Mr. Cass Gilbert's phrase, the exact method of obtaining it is of comparatively minor importance. Nevertheless, we should like to see more definite signs of organised and co-ordinated wisdom. As yet we are left in doubt as to whether the Government intend to gather this wisdom fortuitously and casually, or whether they will attach it to themselves regularly and statedly. Either course would have its natural drawbacks. The former is too loose, the latter might easily become hidebound. We can only trust that the R.I.B.A. is making the most of the greatest opportunity it has ever had of impressing itself upon the counsels of the nation in a matter in which the interests of the country, the profession, and the art of architecture, are intimately concerned, and at many points coincide.

The Example of Paris.

In Paris, great doings are toward. The Chamber of Deputies, by 338 votes against 33, has passed a Bill sanctioning the borrowing of a sum that is about equivalent to thirty-six millions sterling, to be expended on works for the hygenic and æsthetic improvement of Paris, and there is no doubt that the Senate will endorse the action of the Chamber. As the voting indicates, there were many abstentions, and some of the Paris papers, commenting on this fact, accuse the absentees—who were, it seems, mostly country members—of callousness towards the capital, and no word of gratitude is offered them for having at least had the decency to remain neutral. Now, if such a vote had been taken in the House of Commons with regard to London, the provincial mind—which in this connection does not by any means exclude metropolitan members—would have been actively and successfully hostile; for where building is concerned we have not yet learned to think in tens of millions. In fact, in referring to the provincial mind, we do the provinces a gross injustice; for, in proportion to their size and wealth as compared with London, they display, on the whole, an amount of enterprise and of corporate pride to which the Londoner has not yet attained, and it would perhaps be more just to say that his view of building operations is parochial rather than provincial. The example of Paris should not be lost upon him. One regrets that it was not exhibited four or five years ago, when it would have been useful as a stimulus to the "Little Londoners" who have cut down the cost of the County Hall to a sum that, however tremendous it may look to the mean-spirited ratepayer—whom vote-hunters have almost persuaded that every pound spent on London comes out of his own pocket—is really insignificant as compared with the importance of the occasion.

Architectural Copyright.

The report of the Committee of the Law of Copyright, in so far as it relates to architecture, is printed in our Special Issue, dated December 31st, 1909. The committee recommend that architecture should be protected under the law of copyright, both in order to bring about uniformity with the revised International Copyright Convention signed at Berlin on November 13th, 1908, and "because it deserves to be protected and presents no differences in principle from that applicable to the sister arts." We imagined that, considering the mass and weight of evidence placed before them by the appointed representatives of the R.I.B.A., the committee could hardly arrive at any other decision. Yet it is not surprising that Mr. Joynson-Hicks, and two other members of the committee, have dissented from the finding. Mr. Joynson-Hicks's chief objection seems to refer to difficulties of administration. He appears to think that it would often be hard to decide what was and what was not an infringement; but we think that he could hardly have given sufficient attention to the extant records of the working of the law in foreign countries. He does not quite see how infringement could always be penalised. He shrinks from the pulling down of a "pirate" building; and he thinks that such a drastic course might inflict unmerited hardship on an innocent owner. This, however, is to anticipate the passing of a very wooden sort of an Act. We are inclined to think, however, that Mr. Joynson-Hicks reflects more truly than the majority of the committee the spirit with which the measure will almost certainly be received in the House of Commons. Even supposing the architects of the kingdom go solid for copyright, they are likely to be met by strongly opposing forces, in face of which the chances of the committee's recommendations immediately becoming law seem rather remote. It is very far from our intention to throw cold water on the movement; and we trust that these observations may be taken in the sense that to be forewarned is to be forearmed.

SURFACE TREATMENT OF CONCRETE.

By Thomas Potter.

Now that concrete for general building purposes is recognised as one of the best and strongest systems of construction, the difficulty is as to the most suitable methods of finishing the external surfaces of monolithic walls.

Cavity Walls.

In olden times, the concrete was usually faced on both sides, or on one side only, with stone or brick, and the cavity between was filled with concrete. When the facing was external only, forms or shutters were used on the inside in the same way as practised at the present time. This was more easily done than now, as the walls were usually thicker. Reading Abbey, and other extensive ruins, show the stone facing decayed in parts, leaving the concrete core generally intact. The same method of construction is still practised occasionally, where the walls are thick enough for the purpose; but, unless the facing material is of a substantial character, the concrete is apt to disturb it if punning or tamping is practised, whereas if punning or tamping is omitted, the concrete must be deposited in a sloppy condition, otherwise it will not be homogeneous, and will probably allow damp to penetrate.

To Allow for Tamping.

The walls of a suburban church that was built some five-and-thirty years ago, were faced with brickwork, a half-brick in thickness on both sides, with core of cement concrete. Tamping, however, tended to push the brickwork out, and, as a remedy, the walls for a certain number of courses in height were built to slope slightly inward, so that when the concrete was deposited in place tamping was practised until the brickwork was plumb.

It was formerly the custom, where lime was used as a matrix, to deposit the aggregate in a dry state between the facings, and pour in the lime in the form of liquid grout until it had filled up all the interstices, and in this way pressure on the facings was almost avoided.

One-side Facing.

If concrete walls are faced on one side only with other materials, the temporary wood forms or shutters cost nearly as much as if they were necessary on both sides; for although only one-half the boards are necessary, the labour is much more in proportion, as the forms have to be substantially strutted to keep them rigid; whereas, if necessary on both sides, they can be bolted, or otherwise attached to each other, in which case much lighter strutting is required.

But, whatever the facing materials may be, it must be bedded with cement, and time must be allowed for it to harden before the concrete is added: and not more than a foot or eighteen inches in height should be built at a time, unless the facing is of heavy and substantial character. Great care has to be exercised in watching and plumbing the facings, in order to make sure that they are not forced outward while the concrete is being poured in.

Flint Facing.

Flints would, on a superficial view, appear to be the worst materials for facing; but in reality they are among the best. They can be built a foot in height at a time, and after the work has been allowed to rest for a day or two for the cement to harden, the concrete can be deposited in place, and with ordinary care the flints will not be disturbed. Owing to the irregular size and shape of the flints, the concrete bonds with them in a way much superior to brickwork backing, and it becomes a difficult matter to remove any after the concrete has been in place for a few days. Church walls built with flints and having a Caen stone slab facing one and a half to two and a half inches in thickness on the inside, were in every way a success.

Flint Chequer-work.

Chequer-work for walls—i.e., flint squares twelve to eighteen inches square, alternating with faced stone of a similar shape and size—is simpler still, as flints can be faced and laid face downwards in open frames or boxes and backed up with concrete to three or four inches in total thickness (the frames having small holes in the bottom and sides to let the effluent water pass away), and when hard, set by masons in the same way and at the same time as the stone squares.

Encaustic Tiles.

Facing monolithic walls with encaustic or coloured tiles by placing them in the wood trough formed by the shutters, and backing them up with concrete, has been advocated and tried, but, so far as the writer is aware, with no great measure of success.

Coloured Concrete Slabs.

Concrete slabs about an inch in thickness, with lugs at each end, or metal bars to tie them to the concrete core, were used to some extent at one time. They were cast in iron moulds, and the cement for the faces of those required for external use was stained with oxide of iron, while those for the inside of the walls were left rough to afford a key for the plaster, or left smooth of a natural colour, and afterwards painted or distempered. The external and internal slabs were held together temporarily by wood clamps until the concrete had set.

If good, permanent, and suitable colours could be secured, possibly some system of the kind might be practicable, but, owing probably to the lime constituent in cement, the colours are apt in course of time to fade or to become paler. Earthy stains, such as ochres and umbers, weaken cement, which appears to resist affinity with materials whose particles are finer in size than itself.

First Scale Pattern Slabs.

Another system of facing concrete walls was the use of cast concrete slabs of a fish-scale pattern, an invention of the late Mr. Lascelles, of Bunhill Row, but although sometimes used as a facing for concrete walls, they were better adapted for fixing with wood screws to wood framing. They were stained in the ordinary way, and cast in metal moulds.

Stucco the Chief Resource.

Apparently, therefore, in the absence of some better method of treating the surfaces of monolithic concrete walls of moderate thickness, the use of a plastic material is the only remedy to fall back upon. It has been stated that Portland cement does not adhere well to concrete, and if used as stucco for outside walls, will come off. Having cemented many concrete walls of buildings, I can only say that I never knew this to occur in a single instance. If the concrete face is very smooth, perhaps hacking the surface may be advisable, but I never found it necessary if the walls were well watered, the cement well seasoned, and preferably not applied when the sun's rays were powerful.

Roughcast for Rural Districts.

In rural districts and provincial towns Portland cement can be used in various ways that are not so well adapted for large smoky cities and manufacturing places. Roughcast, for instance, is not suitable to towns, since smoke and soot particles cling to all irregular surfaces, rain merely removing them from point to point. Cement is now recognised as being of an extremely durable character, capable of resisting the acid constituents of the London atmosphere; and also it admits of architectural treatment in a rational manner.

A Bad Old Tradition.

Unfortunately, cement was used to so great an extent many years since to clothe all kinds of rotten brickwork, and its treatment was so constantly in the hands of a low class of piecework plasterers, who had peculiar notions of trying to imitate stone, and masons' joints, and who used the cheapest cement and sand procurable; the result be-

Photo: Arch. Review.

SHOP FRONT, HIGH STREET, MARYLEBONE, LONDON, W. REGINALD BLOMFIELD, A.R.A., ARCHITECT.

ing such deplorable failure, that the words "stucco" and "jerry building" became for a time synonymous.

Previous to the invention of Portland cement, and for years after, Roman cement, invented in 1796, was extensively employed as a facing material for walls, and much sound work that was done fifty to eighty years since is still in existence, and is apparently as good as it ever was, but its colour necessitated its being distempered or painted. It was usually called "cement stucco," in contradistinction to a much less costly process, in which ground lime, usually blue lias, and sharp clean sand, or preferably pounded slag sand, were the ingredients employed, and very great care was taken in the mixing and application.

For rural buildings and small towns, roughcast in panels, with narrow bands of cement, is inexpensive, and forms an appropriate finish to concrete walls; but it should be executed by workmen who are accustomed to this class of work. The shingle or gravel should be washed quite clean, preferably by passing it through a cross-mesh sieve, of the size required, in a tub of water, until every particle of dirt and foreign matter is removed. The sand should be coarse, sharp, and clean, the lime of an hydraulic character, and best quality, and quite fresh. The proportion usually is: one part of lime, two parts of sand, and two of shingle, all by measure. The ingredients require to be intimately mixed and kept well stirred until no particles of lime remain unslaked, the mass being then allowed to cool.

A coat of good lime and hair mortar is applied as a rendering coat to the walls, and scratched with a lathe in the usual way; the second or floating coat is applied when the rendering coat is quite dry, and then straightended with a floating rule. While the work is still soft the roughcast is thrown on vigorously with a scoop. One coat of plaster only is sometimes used, but it makes inferior work as compared with two coats. Necessarily only a few yards must be floated at a time before the roughcast is thrown on.

Pebble-dashing.

Pebble-dash, as it is called, consists in dashing clean washed pebbles, or small pieces of flint, shells, etc., in a dry state on the floating coat of hair mortar, and gently pressing them in with the hand, or with a hand float. This is more often done when the pebbles, etc., are of a suitable colour. Roughcast is more often whitened or coloured as may be preferred.

Portland cement mixed with sharp, clean, coarse sand, in the proportion of 1—3 or 1—4, is sometimes used in preference to lime and hair mortar; it insures dry walls, but the second coat has to be applied in smaller surfaces at one time, owing to its quicker setting properties. If delayed too long, the shingle fails to get a grip of the cement, and bald patches are the result.

Stabbed Stucco.

An old-time treatment of plastered walls in an economical way is to mix together Portland cement and lime putty in equal proportions, and add three or four parts of sharp sand. This is applied in the usual way—either one or two coats—and when partly set, is stabbed with the stump of a birch broom, the end cut or trimmed straight and even. Better still is to fix in a plasterer's hand float, about half the size of an ordinary float, and small nails driven through from the back until they project about a quarter of an inch, and rough-shapen the points with a file. They require to be about three-eighths of an inch apart, over the whole area of the float. With this implement the cement surface is "stabbed." A little practice is necessary, but if the work is done well the appearance is very satisfactory, and the surface is of superior durability as compared with roughcast.

Cement Stucco for City Streets.

Cement stucco for certain classes of buildings in smoke- and soot-laden places like London is no doubt an exceedingly convenient material. Cement, judiciously applied, and of the best quality, mixed with pulverised slag as a sand constituent, is equal in hardness and durability to almost any natural stone. There is nothing has such an affinity for cement as slag sand, if it is kept a sufficient time to liberate by aeration any sulphur it may contain.

In Victoria Street, Westminster, where none of the buildings are more than about fifty years old, nearly every kind of wall facing material in common use has been employed. Stone, brick, cast concrete, cement, terra-cotta, and a sprinkling of granite and marble, are all in evidence; but owing to soot and smoke the various materials are scarcely distinguishable from each other.

R.I.B.A. EXAMINATION RESULTS.

The Preliminary.

The preliminary examination, qualifying for registration as Probationer R.I.B.A., was held in London and the undermentioned provincial centres on the 8th and 9th November. Of the 123 candidates admitted, claims for exemption from sitting for the examination were allowed to the number of 35. The remaining 88 candidates were examined, with the following results:—

District.	Number Exam'd.	Passed.	Re'egated.
London ...	... 46	26	20
Birmingham ...	... 4	3	1
Bristol	... 7	5	2
Cardiff ...	... 3	2	1
Glasgow ...	... 3	2	1
Leeds	... 6	5	1
Manchester ...	... 16	8	8
Newcastle ...	... 3	3	0
	88	54	34

The 89 passed and exempted candidates, who have been registered as Probationers, are as follows:—

Ackroyd, S. W., Yorks; Adams, W. A. C., W. Kensington; Alison, W., Glasgow; Anglin, S. N., Hale; Apperly, E. L., Hyde Park, W.; Arthur, J. L., Llandaff; Ashbolt, J. S., Southampton; Bagenal, P. H. E., London, S.W.; Bell, C., Dundee; Betts, A. W., Nottingham; Bhedvar, S. K., Brixton Hill, S.W.; Blyth, C. K., Highbury, N.; Boddington, F. E., Brisbane; Broadhead, F. A., Nottingham; Brown, P. N., Huddersfield; Cobb, R. S., Shortlands; Cook, C. R., Wallington; Court, H. W., Greenwich, S.E.; Crabtree, E. J., Southport; Crossland, H. E., Sutton-in-Ashfield; Curwen, J. S., Kendal; Daly, T., Renfrewshire, N.B.; Dear, F. T., Lambeth Road, S.E.; Dod, H. A., Birkdale; Donaldson, B., Newcastle-on-Tyne; Donger, W. J., Winchester; Edmunds, H. C., Swansea; Edwards, S. J., Pinner; Farr, R. P., Lombard Street; Fletcher, D., Uttoxeter; Fox, W. E., Gainsborough; Godwin, W. H., Birmingham; Gratton, S., Newton Abbot; Gregory, H., Yorks; Hamilton, T. C., Wallsend-on-Tyne; Harman, S. W., Teddington; Hemm, G., Heaton Chapel, nr. Stockport; Hickman, E. J., Birmingham; Hickson, H. A., Netherton, nr. Huddersfield; Holroyd, F., Woodlesford, nr. Leeds; Horton, A. W., Derby; Hoten, S., Stonebroom, nr. Alfreton; Hunter, A., Stockwell Road, S.W.; James, J. A. B., Port Talbot; Jones, R., Parcmain, Carmarthen; Knight, W. J., Gloucester; Le Grice, C. H., Lowestoft; Lennox, H., Ayr; Lewis, G. M., Highbury New Park, N.; Lipscomb, S. G., Edgware Road, N.W.; Litten, H. E., Twickenham: Macphail, D. St. Clair, Edinburgh; March, J. E., Axbridge R.S.O., Somerset; Marcucci, D., Southfields, S.W.; Moore, J., Beighton, nr. Sheffield; Moorsom, Petersfield; Morley, C. S., Beckenham; Moscrop, W. N. J., Darlington; Norris, W., Oldham; Orme, T. J., Birmingham; Parkes, E. M., Northwich; Peermahomed, A. B., Blackheath, S.E.; Proffitt, G. W., Walkden, nr, Manchester; Roarty, S., Sydney; Robinson, G. J., Salisbury; Rogers, W., Eastleigh; Russell, A. L. N., Roxburghshire, N.B.; Sawer, J. S., Ipswich; Shanks, T. E. T., Bath; Simmons, C. G., Primrose Hill, N.W.; Smith, A., Luton; Somerford, T. R., Brixton, S.W.; Stevens, T. T., Bury St. Edmund's; Taylor, J. A. C., Oldham; Templar, W. R., Seven Kings; Teulon, C. M., Croydon; Thomas, G., Manchester; Thomas, W. N., Crewe; Triscott, H. S., Plymouth; Walker, H. F., Potter's Bar, Herts.; Welch, H., Edinburgh; West, A. J., Nottingham; Williams, F. E., Birmingham; Williams, J. G., Bristol; Williamson, H. R., Edinburgh; Winch, K. M., Richmond, S.W.; Winter, R., Dundee; Woodroffe, N. F., Lincoln's Inn Fields, W.C.; Worthington, C. E., Upper Phillimore Place, W.

Intermediate Examination.

The intermediate examination, qualifying for registration as Student R.I.B.A., was held in London and at the undermentioned provincial centres on the 8th, 9th, 11th, and 12th November. One hundred and eight candidates were examined, and the results are reported as follows:—

District.	Number Exam'd.	Passed.	Relegated.
London ...	... 69	35	34
Bristol ...	... 5	2	3
Cardiff ...	... 4	2	2
Glasgow ...	... 3	2	1
Leeds	... 10	4	6
Manchester ...	... 11	5	6
Newcastle ...	... 6	1	5
	108	51	57

The successful candidates are as follows, in order of merit, as placed by the Board of Examiners:—

Knight, F. W., Chelsea, S.W.; Rutter, W. A., Cardiff; Selway, E. R. D., Clapham, S.W.; Scott, B. W. H., Clapham Park, S.W.; Holland, H. D., Wigan; Robinson, H. L., Leytonstone; Broad, K. S., Putney, S.W.; Moir, D J., Glasgow; Hendry, H. D., South Wanstead; West, J. G., Westminster, S.W.; Houston, W. W., Belfast; Morley, W. B. R., Norwich; Voelkel, W., Yorks; Gunton, W. H., Blomfield Street, E.C.; Pedley, E. W., Derby; Hague, H. V. De Courcey, Blackpool; Macmillan, A. L., Southport; Knyvett, J. S., Birmingham; Shears, R., Westcliff-on-Sea; Miller, S. R., Acton, W.; Owen, A. H., Holloway, N.; Knott, A. J., Weston-super-Mare; Nightingale, F. B., Wandsworth Common, S.W.; Bradley, H., Blackpool; Clark, W. L., Phœnix Street, N.W.; Colbeck, H., Halifax; Cowper, R. S., West Kensington, W.; Davies, J. C. G., Morriston, Glam.; Evans, C. G., Neath; Furniss, R. W., Loughborough; Gilks, S. L. C., Putney, S.W.; Hall, M. A., Lincoln; Hallett, G. F., Brighton; Harrison, S., Middlesbrough; Jessop, B., Notts.; Knapp-Fisher, A. B., Kensington; Lay, C. H., Suffolk; Lowry, R., Bayswater, W.; Martin, C. F., Edgbaston; Newham, T. N., Hastings; Pickmere, T., Liverpool; Reid, C. B., Vauxhall Bridge Road, S.W.; Rylatt, A., Hull; Smeed, C. A., Stratford, E.; Surveyor, M. F., Strand, W.C.; Vey, A. E., Chiswick, W.; Walker, R., Vauxhall Bridge Road, S.W.; Welch, H. A., Regent's Park, N.W.; Whitehead, T. G., Croydon; Wilks, J., Manchester; Wylde, F. C., Norbury, S.W.

Exemptions from Intermediate Examination

The following candidates, who had attended the architectural courses and obtained first-class certificates at certain schools of architecture were granted exemption from their names, were granted exemption from sitting for the intermediate examination, and have been registered as Students R.I.B.A.:—

Cable, R. W., Brixton, S.W.; Clarkson, G. F., Kensington, W.; Dod, H. A., Birkdale; Farey, C. A., West End Lane, N.W.; Graeme, A. V. S., Westminster; Hake, G. D. G., South Lambeth Road, S.W.; Hett, L. K., Ardingly; Home, G. W., West Kensington, W.; Jones, T. A., Waltham, Hants.; Levy, A. L., Netherhall Gardens, N.W.; Lodge, T. A., E. Molesey; Matthews, B. F., Stockwell Road, S.W.; Pigott, R. M., Wandsworth Common, S.W.; Prynne, C. E. F., Ealing; Robinson, A. D., Camden Road, N.;

Swindells, F. H., Hampstead, N.W.; Tanner, E. J., Beckenham; Voysey, C., Hampstead, N.W.

Final and Special.

The final and special examinations, qualifying for candidature as Associate R.I.B.A., were held in London from the 18th to the 26th November. Of the 114 candidates examined, 43 passed, and 71 were relegated to their studies. The names of the passed candidates are as follows:—

Ainsworth, J. G., Hyde; Alexander, G. L., Warwick Square, S.W.; Allen, J. G., West Hampstead, N.W.; Atkinson, R., Gray's Inn, W.C.; Auty, J., Morley; Bluhm, Q. M., St. Anne's-on-the-Sea; Bryan, A. F., St. John's Wood, N.W.; Burstow, G. H., Brighton; Chapman, R. T., Bolton; Claypole, E. E. B., Streatham; Davidson, J. A., Londonderry; Davis, C. W., Birmingham; Dickman, H. A., Nottingham; Douglas, A. H., N. Kensington, W.; Elton, P. I,. South Kensisgton, S.W.; Finn, E., Canterbury; Goodchild, W., Ipswich; Guthrie, L. R., Adelphi, W.C.; Hadwen, N.W., Triangle, Yorks.; Hanscomb, C. E., Ladywell, S.E., Hastewell, R. E., Haltwhistle; Hawkins, F. G., Hendon, N.W.; Hepple, F. H., Worcester; Hollis, H. C., Oakley Square, N.W.; Maxwell, W. C., Belfast; Milburn, W., junr., Sunderland; Moberly, A. H., Campden House Road, W.; Munnings, J. F., India; Orme, R. W., St. Anne's-on-Sea; Osler, F., Hammersmith, W.; Page, J., Bowes Park, N.; Roberts, D. J., Erdington, nr. Birmingham; Roberts, W. J., Manchester; Rowledge, G. H., Manchester; Sagar, W. H., Chelsea, S.W.; Scott-Willey, Reigate; Stone, G. M., Brixton Hill, S.W.; Stonehouse, C., Blackburn; Thompson, M., Lytham, Lancs.; Troup, F. G., Bayswater; Ware, V., Bournemouth; Woollatt, J., Nottingham; Wright, C. L., New Malden.

The following table shows the number of failures among the seventy-one relegated candidates in each division of the final examination:—

I.—Design	51
II.—Mouldings and Ornaments	61
III.—Building Materials ...	15
IV.—Principles of Hygiene ...	20
V.—Specifications	27
VI.—Construction, Foundations, etc.	33
VII.—Construction, Iron and Steel, etc.	22

Colonial Examinations.

The following candidates passed the Colonial intermediate examination held in Sydney, November, 1908:—

Keith-Harris, R. J., Sydney, N.S.W.; Roarty, S., Sydney.

The following candidates passed for Colonial special examinations qualifying for candidature as Associate R.I.B.A., held in Sydney last June:—

Sutcliffe, H., Australia; Taylor, E. A., Sydney, N.S.W.

The following candidate passed the special examinations held in Johannesburg in July last:—

Beall, W. J., Natal.

ST. PAUL'S CROSS.

Part of the foundation has been laid for the cross to be erected on the north-east side of St. Paul's Churchyard on the site formerly occupied by the fountain, which was removed to Hornsey, and there opened recently by the Lord Mayor. The late Mr. H. C. Richards, K.C., left £5,000 for the erection of the cross, and Mr. Reginald Blomfield prepared the designs.

Mr. Bertram Mackennal has executed a bronze figure of St. Paul, who is represented grasping a cross in his right hand. The figure stands nine feet high, upon a Doric column, with an ornamental plinth and platform, surrounded by a balustrade of black marble and Portland stone. On three sides memorial panels have been placed, while on the fourth a bronze gate is situated. When complete the monument will reach a height of fifty-two feet.

Strong foundations have been necessary to support the statue, and excavations to a depth of thirty feet have been made. This portion of the work has occupied the contractors for three months, and they expect to conclude the work a year hence.

THE HOUSING CO-PARTNERSHIP MOVEMENT.

The secretary of the Co-partnership Housing Council has issued his annual statement, from which it appears that the movement was inaugurated at Ealing in 1902, and at the end of 1906 the amount of capital invested was £88,935. In the following year that sum was more than doubled, reaching a total of £204 639. In 1908 there were eight societies in existence, the same number as in the previous year, and the investments in property amounted to £346,514. Last year four societies were added, making 12 in all, and the amount invested has increased about 60 per cent., the investments totalling £536,300. The 12 societies are situated in the following districts:—Ealing, Letchworth, Sevenoaks, Leicester, Manchester, Hampstead (two), Harborne, Fallings Park, Stoke-on-Trent, Wayford, and Derwentwater. There are now houses let to tenants at 3s. 9d. per week in the provinces, and 6s. per week in London, which not only give living accommodation at least as good, in the way of air space, as any others within the neighbourhood, but also give the tenants the privilege of using club-rooms, tennis-courts, bowling greens, play spaces for the children, and fields for athletics. The houses, too, are never built at more than 12 to the acre, against 30 or 40 on the ordinary system.

DALCHROY, ADVIE, STRATHSPEY VIEW FROM THE RIVER STRATHSPEY. A. MAITLAND AND SONS, ARCHITECTS.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Jan. 15.	ELEMENTARY SCHOOL, KEIGHLEY.—The Education Committee invite competitive designs and estimates for a new Public Elementary School for older children to be erected at Highfield, Keighley. Printed instructions and conditions, with a lithographed plan of the site, may be obtained on application at the Education Offices. Designs and estimates to be sent by Jan. 15 to H. Midgley, Secretary, Education Offices, Keighley. Only architects residing or carrying on business within the Borough are invited to compete.
Jan. 31.	NATIONAL MUSEUM OF WALES. The Council desires to receive competitive designs for the erection of a new National Museum at Cardiff. Three premiums are offered of £200, £150, and £100, for second, third, and fourth. The Council have appointed Sir Aston Webb, R.A., Mr. John J. Burnet A.R.S.A., and Mr. Edwin T. Hall, F.R.I.B.A., as Assessors. Particulars and plans of the site will be supplied to competitors on payment of a fee of £2 2s., returnable if all papers are returned within 14 days. Inquiries to be addressed to Dr. Wm. Evans, Hoyle, Director of the Museums. City Hall, Cardiff.
Jan. 31.	PEMBROKE (Co. DUBLIN) LAYING OUT HERBERT PARK. The U.D. Council invite schemes with estimates of cost, for the laying out of above public park, which is about thirty-five statute acres in extent, within their district. A premium of £50, which is to include all expenses, will be paid to the person whose scheme may be selected. All plans, estimates, etc., sent in by the successful competitor to become the property of the Council. The Council will not be liable for any payment to a competitor, other than the above premium to the successful party. A plan of the lands as now existing can be obtained from on and after Monday, 3rd January, 1910. J. C. Manly, Clerk to the Council, Town Hall, Ballsbridge, Pembroke, Co Dublin.
Feb. 1.	OLDHAM, EXTENSION OF THE TOWN HALL. Restricted to Architects practising or residing in the Borough. Premiums of £50, £30 and £20, for the three designs placed 1st, 2nd and 3rd, and a sum of £5 will be paid to all unsuccessful competitors who send in a complete set of plans in accordance with the instructions. Plan of site, with instructions and suggestions for architects obtainable from E. C. Foote, Borough Surveyor, Town Hall, Oldham. Deposit: 21s.
Mar. 1.	GLAZED BRICKWORK DESIGNS AND ESSAYS. A committee of glazed brick manufacturers invite designs for works to be executed in glazed brickwork, also essays as to the advantages to be derived from the use of this material in accordance with conditions to be obtained from J. Johnston Green, 142, Liverpool Road South, Southport. Premiums of 100 guineas, 50 guineas and 25 guineas awarded to designs and essays jointly. Assessor Mr. Max Clarke, F.R.I.B.A., appointed by the President, R.I.B.A.
May 31.	MUNICIPAL OFFICES, KARACHI. The Municipality offer a premium of 7,500 rupees (£500) for the best design, detailed plans and estimates for new Municipal Offices. Cost not to exceed 500,000 rupees, and the style of architecture is left open to the designers. Ferrotype plans of the site and a general arrangement of the floors of the building showing the accommodation to be provided, together with a copy of instructions to architects, will be supplied to intending competitors on application to the Chief Officer and Chief Engineer, Karachi Municipality. A charge of Rs. 5 will be made therefor, which will not be refunded. Each set of drawings must be sent in anonymously, but accompanied by a sealed envelope containing the author's name and address. Each set of drawings and all the documents required, including the sealed envelope, must be securely packed in a wooden box addressed as follows:—The Chief Officer and Chief Engineer, Karachi Municipality, Karachi, India, and forwarded, at the competitor's own risk and charges, in time to reach the Chief Officer on or before the 31st day of May, 1910. It is proposed to apply to Government for permission for one of the chief architects to act as assessor to decide on the design to which the prize shall be awarded. The decision of the assessor will be final and not be open to dispute. The decision of the Municipality will be made within three months of the latest date for submission of designs, and payment of one-half of the premium will be made thereafter to the author of the selected design, the balance to be paid when the further details specified in the instructions to architects have been supplied. On payment of the premium the Municipality will have all rights in the design, with power to erect the building under its own agency, either according to the design selected or with such additions or alterations as it may deem necessary.

Elementary School, Maldon.

The plans of Mr. A. S. R. Ley, 55, Bishopsgate Street Without, E.C., have been accepted by the Essex Education Committee for the new elementary school at Maldon. The estimated cost is £5,554 10s.

Girls' Elementary School, Loughton.

The plans of Mr. H. Tooley, of Buckhurst Hill, have been accepted by the Essex Education Committee for this new school at Loughton, which, it is estimated, will cost about £4,460.

New School, Broomfield, Chelmsford.

The Essex Education Committee have invited Mr. P. M. Beaumont, Maldon, Messrs. C. and W. H. Pertwee, Chelmsford, Mr. H. Tooley, Buckhurst Hill, and Mr. A. Christy, London, to compete for the above.

New School at Heybridge, near Maldon.

The Essex Education Committee have invited Mr. J. W. Start, Colchester, Messrs. C. and W. H. Pertwee, Chelmsford, Mr. P. M. Beaumont, Maldon, and Mr. J. R. Rogers, Maldon, to compete for the above.

Leeds Training College.

Sir Aston Webb, C.B., R.A., has assessed the above competition, which was limited to Leeds architects. Twenty-seven designs were submitted, the design numbered 9 being selected as the best design for the college. The author of the design was found to be Mr. G. W. Atkinson, of Mark Lane, Leeds. The assessor reported that of the remaining designs, Nos. 4, 13, 14, and 26 would be the next suitable for the erection of the eight hostels which form part of the scheme, and the respective authors were disclosed as Mr. Albert Kirk, Bond Street, Leeds, Mr. S. D. Kitson, M.A., Greek Street Chambers, Leeds, Mr. W. P. Schofield, A.R.I.B.A., Albion Street, Leeds, and Messrs. Percy Robinson and W. Alban Jones, Albion Street, Leeds. The cost of the whole scheme, embracing the college and eight hostels, is expected to be about £130,000.

Wood Green Public Baths.

The U.D. Council have selected the design of Mr. Harold Burgess, of West Green, South Tottenham, for the above, the second premium of 25 guineas going to Mr. E. Harding Payne, John Street, Bedford Row, W.C., and the third premium to Messrs. F. S. and F. Danby Smith, of Parliament Mansions, Victoria Street, S.W.

At an exhibition held at Clifford's Inn Hall, Fleet Street, by Mr. T. Fisher Unwin, the most noteworthy items were two magnificent drawings of Rouen Cathedral by Mr. Joseph Pennell.

* * *

Mr. John McKie Elliott, of Prospect Street, Gateshead, lath-render and builders' merchant, who suffered from an almost lifelong blindness, and who died on November 27, aged 70, left estate valued at £12,143 gross, with net personality £6,423. The testator, after certain bequests, left the residue of his property, apparently amounting to about £10,000, to form a fund for the benefit of blind persons, of whatever age or sex or creed or absence of creed, in Newcastle or Gateshead.

Correspondence.

The R.I.B.A. Form of Agreement.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—A misprint has been discovered in Clause 30 of the Revised Form of Agreement and Schedule of Conditions for Building Contracts which has been issued from the Royal Institute since October 14th, 1909. If all those who have purchased copies of the form since that date will kindly return them to me, I will at once send them corrected copies.

IAN MACALISTER, Sec. R.I.B.A.

Builders' Locked-up Capital.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Your correspondent "A Lancashire Builder" voices the opinion of a large number of North-country builders. The locked-up capital of builders is appalling, and calls for drastic remedies. I know of a builder in this district who has over £20,000 out, which is more than 14 months overdue.

I think it is time a move forward was made. It is of little avail commiserating each other on the hard lot of builders. We could all, I daresay, give examples galore of the injustices perpetrated. Let us cease talking about it and get into action.

I have often wondered why it is that the building trade is conducted on lines so different from any other important trade.

I remember meeting a while ago a gentleman who had deserted the building trade for the bleaching industry. He told me he never knew what comfort was while he was in business as a builder. Since he got out of building business has been a delight to him. The accounts come to hand monthly, nett, on a given date, as regularly as interest on debentures. No seeing architect or surveyor and earning his profit a second time as an advocate after first earning it as a tradesman, and at the best getting paid months, perhaps years after it was due. I have often thought of his words since.

We have in Lancashire a gigantic trade in the various branches of the textile industry, whose basis of business is with tradesmen, cash monthly, but unfortunately builders are treated as something quite apart from ordinary business routine, and are at once deprived of the usual privileges of other tradesmen.

We are the only body of tradesmen I know who wait for our accounts to be made out by the party who has run up the bill. I know this is the practice bequeathed by past generations, but why should it continue?

Before we can prescribe the proper remedy we must ascertain the real causes of this departure from sound business methods. Is the proprietor, architect, or builder to blame?

The proprietor, in my opinion, is merely taking advantage of our loose methods, and what is now almost a custom.

The architect fails because, first and foremost, he is an artist, a thinker, a dreamer if you like; and to persons of that temperament figures and accounts are a dreaded nightmare. He has no commercial training to balance the irresponsible artist temperament, and he cannot understand why he should be worried with things he hates, especially when he is so busy with new work which he hopes to get. I am writing now of the architect who takes out his own quantities, which seems to be becoming more the practice in the North.

Sole contractors and sub-contractors are often suffering from the same disease as the architect, that is, over-development of one side of their character (the trade side) and a want of development of the commercial side.

Here you have two classes of people who have been largely warped in their training. Is it any wonder that an evil practice is the outcome, and that builders are the shuttlecocks of interested parties?

ADDITIONS TO THE GOLDSMITHS' COLLEGE, NEW CROSS. REGINALD BLOMFIELD, A.R.A., ARCHITECT.

These additions consist, on the ground floor, of five class rooms, a large art room, and a large room for nature study. On the first floor are two rooms for crafts, a costume-life room, a design room, museum, and nature-study room, the head art-master's room, lavatory, and cloak room. On the second floor are two rooms for crafts, lecture room, nude-life room, higher-painting room, three modelling rooms, and casting room, with lavatories, etc. The facings are of red brick, with Portland stone dressings, and the roof is covered with Westmorland green slates. The older building, described in one of the Sunday papers as a charming Georgian building, was, in point of fact, built about 1840, and formed an indifferent example of brick and stucco of the heavy classic of the time. The general contractor for the new work was J. Carmichael, of Wandsworth. The sanitary work and heating was carried out by Burn Brothers, and the carving was executed by W. Aumonier and Son, to the designs and under the supervision of the architect.

I should like to see the influence of our Federation turned into other channels than combating the demands of labour merely. The time has arrived when we must take a broader outlook and tackle such questions as these which have such a blighting effect on our trade.

I should like to see a return to the practice of quantities being taken out by duly qualified quantity surveyors independent of the architect's staff. Builders can then get a more impartial tribunal for the settlement of differences and prices. It is asking too much of human nature for the architect to condemn himself or his staff, and this means that the builder must face his own and the architect's omissions and miscalculations.

I think a "Lancashire Builder's" suggestions are very good ones, but do not go far enough.

There is a large body of builders in the Northern Federation of opinion that the R.I.B.A. form of contract has too many blanks, which are filled up in widely varying terms by different architects. What is required is that these blanks should be filled up in agreement with the R.I.B.A., or, failing that, the builders should formulate their own.

LANCASTER.

ARCHITECTURAL ACTIVITY IN AMERICA.

Architectural Employment Bureau.

Tentative plans for the formation of an employment bureau have been made by a special committee of the New Jersey Chapter, American Institute of Architects. It may be used by draftsmen and architects alike, and there will be no charge for the service. The plan is to have an exchange where draftsmen may register and where architects may come for help. A list of the draftsmen will be kept on file, and whenever an architect applies for an assistant he will be given the names of a number of men who are most likely to be able to fulfil his requirements. Very complete data concerning the draftsmen will be kept on file. This will include their full names, ages, education, etc. This information will be kept according to a system that can be referred to readily. There will be no charge for registration. Though the object for organising such a bureau by the New Jersey Chapter, American Institute of Architects, is primarily to aid the draftsmen, it will also be of service to architects. It is expected largely to obviate the bother of having so many draftsmen looking for employment calling at the offices of architects. But best of all, it will give them a list of men, whose qualifications they can tell at a glance, to draw from. Thus it will not be necessary to see young men who are not fitted for the work in question. The committee from the New Jersey Chapter, American Institute of Architects, which has charge of the proposed bureau, is made up as follows: Herman Kreitler, chairman; B. F. Hurd, Frank F. F. Ward, Richard Erler and Alfred Walters.

An Architectural Arts League.

A new organisation has been launched, to be known as the "Architectural Arts League of Atlanta." The object of the association is the promotion of architecture and the allied fine arts. It embraces in its membership sculptors, painters, draughtsmen, mural decorators, etc., as well as architects, and has the power to admit into alliance with the league, artistic, literary, scientific and philosophical societies, which may include in their objects the promotion of architecture or any of the allied fine arts. Instruction in designing, rendering and modeling will be provided and monthly competitions of the "Beaux Arts" and other problems will be held in the league rooms. A special feature will be the annual exhibition of architectural drawings, casts, bronzes and mural paintings, which will be open to the public.

Prof. Percy Ash.

Prof. Percy Ash, in charge of the department of architecture of George Washington University, has been elected Associate Professor of Architecture at the University of Michigan, and was to leave Washington some time before Christmas so as to be able to take up his new duties on January 1. Prof. Ash has been associated with the Department of Architecture of George Washington University for seven years. Five years ago he was appointed professor in charge of the department. He is a graduate of the University of Pennsylvania, where he received the degree of B. S. and C. A. In 1895 he won the travelling scholarship of the University of Pennsylvania and went to Europe to study architecture in Paris and at the American Academy at Rome.

Obituary.

Mr. A. B. Rowe, Architect to Worcestershire County Council.

The death has occurred suddenly of Mr. Alfred B. Rowe, the Worcestershire county architect. Mr. Rowe was the eldest son of Mr. Henry Rowe, who was both city and county architect, and held many kindred offices. Mr. Alfred Rowe succeeded his father as architect to the County Council, and the Standing Joint and Education Committees, in which capacity he planned and supervised the erection of many police and public buildings, and latterly secondary and elementary schools. On the death of his father he succeeded him as architect to the Worcester Charity Trustees, the Worcester Theatre Co., the Worcester Permanent Building Society, and many other bodies. Like his father, he was a zealous and prominent Freemason.

Messrs. L. Whitehead and Co., Ltd., of Portland Works, Portland Place North, Clapham Road, S.W., write to point out that they were the builders of the new Church of St. Michael, Sutton Court, Chiswick (Messrs. Caröe and Passmore, architects), which fact was omitted from the note in our last issue.

* * *

The annual dinner of the past and present pupils of Messrs. Parry, Blake and Parry and Mr. Richard Parry is announced for Saturday, January 22nd, at the Criterion Restaurant. A somewhat novel departure will be made by the omission of speeches and the substitution of a first-class musical entertainment.

DALCHORY, ADVIE, STRATHSPEY, A. MAITLAND AND SONS, ARCHITECTS.

CONCRETE AND STEEL SECTION
(MONTHLY.)

Standard Notation.

The reader of the literature of reinforced concrete, particularly in respect to the theory of design, will appreciate the great advantages that would be derived from uniformity in the algebraical notation employed to represent quantities in calculations. Each author up to the present has been left to choose his symbols at his own free will, and many and various notations have been employed, some of which are better or worse than others. Of course, it would be a very valuable thing if the whole range of symbols employed in engineering calculations generally, were standardized, but that is a large task and but little organised attempt has been made to perform the task. Of course, each branch of engineering uses certain quantities different, or somewhat of different sense, to every other, and as letters or symbols available are small in number, we must expect that the same letters will mean different things in different branches, but first of all we need to strive for uniformity in each branch, though it would be as well if those responsible for the drafting of the lists of symbols in the various branches could consult with each other to avoid too much clashing. Electrical engineering and reinforced concrete engineering are so far the only branches in which standard notations have been arrived at. Of course, it has been urged as a great boon if an international notation could be made, such as we have in chemistry, but in engineering it is very difficult to arrive at a really useful notation to everyone in that way. For instance, after the Science Committee of the Concrete Institute began to consider the subject in 1908, they received in January, 1909, a communication from the International Commission on Reinforced Concrete (formed by the parent body, the International Association for Testing Materials), consisting of a suggested list of symbols for international algebraical adoption for calculations for reinforced concrete. It was found, however, that though some sort of general principles could be agreed upon, the difference in language was so considerable as to render strict conformity with a Continental notation inadvisable. Thus, while the Concrete Institute could agree to adopt the "Three-alphabet" system suggested by the International Commission, consisting of capital Roman letters, small Roman letters and small Greek letters, it decided that the principle of the initial letter, i.e., the use of the initials or the distinctive self-explanatory letters of governing as are customarily employed for abbreviations, forbade the universal application of one standard notation, for it was thought that notation should as far as possible be in harmony with the language in which the specifications and statical computations were written or made. The Concrete Institute has now issued its report with its suggested standard notation, and this is to be considered by the American engineering societies concerned, and there seems hope of agreement between English speaking countries upon one standard English notation. This notation was also put before the International Commission on Reinforced Concrete at its meeting at Copenhagen last year, and it was then found that the representatives of the various Continental countries seemed able to agree upon a single notation, but that ours was considerably different. It was there thought that the only way open was to have two-standard notations—one for the Continent and the other for English-speaking countries, and this is a sensible view to take until we have either a universal language or an international vocabulary of technical terms. As is pointed out in the report of the Science Committee of the Concrete Institute on the subject, if we confine ourselves to the Latin and Greek alphabets we have a total of about 100 letters, from which, however, 33 must be deducted on account of risk of confusion, thus leaving 67 symbols. As there are many hundreds of terms embodied in equations in some form or other in the various branches of engineering, it is obvious that the same symbols must have different meanings in the various branches. An international system of notation would not be suitable for daily national use, for, in so far as it were self-explanatory to the English-speaking peoples, so far would it be a matter of memory to the other nations and vice versa. With these preliminary remarks, we may summarise the Concrete Institute's report as follows: Algebraical notation in engineering formulæ should be simply a species of shorthand in which one letter stands for a word or phrase. This species of shorthand should have a logical basis, should be self-explanatory, and should not tax the memory. The simplest and most natural system is to abbreviate the significant words to their fullest extent. For example, successive abbreviations of longhand would give us in turn such forms as diameter, diam, dia and finally d. Risk of confusion by successive abbreviations is reduced to a minimum by the adoption of what is known as the three alphabet system.

Three alphabet system of notation adapted to the English language:—

LATIN SMALLS.	LATIN CAPITALS.	GREEK SMALLS.
Lineal Dimensions (lengths and distances, etc.)	Areas and Volumes	
—	Moments	—
Intensity of Forces	Total Forces	—
Intensity of Loads	Total Loads	—
Intensity of Stresses	Total Stresses	—
—	Angles	Angles
Constants, etc.	Constants, etc.	Constants, etc.

The notation has been drafted so as to leave the symbols independent of the magnitude of various units. Therefore it is necessary for writers to specify in every case what units they employ. For example, according to circumstances, W may represent

Weight per unit of length,
Weight per unit of area,
Weight per unit of volume.

In specifying the units employed, it is suggested that the Hospitalier notation, consisting of the following abbreviations be used:—

Inches = ins. Feet = ft.

Cubic inches = ins.^{3} Pounds per square inch = lbs./in.^{2}

Hundredweights per cubic foot = cwts./in.^{2}

Tons per square foot = tons/ft.^{2} etc., etc.

We have published articles in these columns recently in which we have employed the notation of the Concrete Institute, and we hope that it will come into immediate general use, for it deserves to be. It has the great merit of being mnemonic, and we feel sure it will commend itself to almost all English-speaking engineers, as being most practical, and if another standard notation is used by Continenetal writers, then it can easily be understood and learnt by the few who consult writings in other languages, and it will be an easy matter to transpose from one notation into the other. Indeed, we might here remark on the lax way in which many translators of technical articles and books repeat the same symbols and use the same phrasing instead of going to the slight extra trouble of twisting sentences round and transposing into other symbols, so as to be easily read and grasped by the average reader.

The Theory of Reinforced Concrete.

Mr. Charles F. Marsh, M.Inst.C.E., M.C.I., has written a good deal on the subject of reinforced concrete design in theory and practice, and in association with Mr. William Dunn, F.R.I.B.A., has published two very valuable books, namely, "Reinforced Concrete" and "Manual of Reinforced Concrete." We were among the first to welcome the former as the standard work on the subject in the English language, and it still occupies a foremost position, while the latter volume is a most useful handbook for constant reference for those in practice. But there has been room for a shorter work, occupying a position between the two, for the first is a bulky work and expensive perhaps to many students, while the "Manual" is only an abbreviation of the conclusions, as it were, of the larger work and a sort of pocket book of formulæ without the argument. Mr. Marsh has now, alone, written a work which fulfils the need. It is called, "A Concise Treatise on Reinforced Concrete," and is published at the moderate figure of 7s. 6d. nett. by Messrs. Archibald Constable and Co., Ltd., of 10, Orange Street, London, W.C., the publishers of his other works. This work is a sort of abbreviation of the theory part of the large book, though it is in no wise copied, and contains considerable matter that is new in treatment and perhaps some new facts. It serves to explain the "Manual," too. Mr. Marsh, in his preface, gives as a reason for publishing this "Concise Treatise" that the greater publicity given to the subject of recent years has led to a better understanding of it, so that it has at length become possible to treat it in a considerably more condensed manner than was justified a few years ago, since details of construction and lengthy descriptions of experiments have no longer the special interest that they possessed in the immediate past. We believe with the author that this volume should meet the demand that undoubtedly exists for a concise and handy volume. We welcome the book especially because we do not quite like the manner in which other authors have dealt with the subject as regards the instruction of the student in the way he should go. Mr. Marsh develops his subject scientifically, and his rigid and careful treatment of the theory must be valuable to the student. He himself draws attention to the many points in which the assumptions made for purposes of calculation depart from the results obtained by exact experiments, but he shows the reasonableness and utility of these hypotheses, and the student is warned against taking everything as final. The spirit of inquisitiveness in the study of reinforced concrete should be fostered, and Mr. Marsh's book shows the student the right road. Though at times we are inclined to think some of the author's remarks savour of the trite and the obvious and are out of place in a "concise" book, we recognise the difficulty of instructing the beginner in the subject, and the need of preparatory groundwork. There are many points in theory, too, in which we differ from the author. Stresses in bending and shear are not so simple as Mr. Marsh makes them, and in a book of this character an author should be very chary of laying down the law. We trust, too, that in future editions of all his works he will use the standard algebraical notation of the Concrete Institute, which will, we feel sure, do much to help the reader to readily follow the text.

RAPID AND EASY DIAGRAM OF MAXIMUM STRESSES: FAILURE BY SHEAR, PLASTIC AND ELASTIC.

By Professor Robert H. Smith.

Tension and compression are commonly referred to as "direct" stresses; but a better and more expressive name is "normal" stress, and this term will be used in this article. It is the component of the whole stress on a section which is perpendicular or normal to the section. The other components parallel to the section are termed "tangential," or shear.

The mathematics of stress and strain in solids within the limits of "perfect elasticity" have long ago been worked out very fully and accurately, and it is improbable that much future useful development of them is possible. The true and full meaning of the condition of "perfect elasticity," which is the basis of all this mathematics, is, however, very far from being universally understood in any clear and definite manner; and on this subject several remarks will be made below.

The Theory of Failure.

In quite recent years a revolution in the theory of failure of material under stress has been threatened, and is now making rapid headway. This began with the experiments of Mr. Guest in 1900. Since then the further investigations of Mr. Turner, Professor C. A. Smith, Mr. Hancock, and Mr. W. A. Scoble have greatly advanced our knowledge. The latest papers on the subject were read on November 26th by Mr. Scoble before the Physical Society, and by Professor Smith and Mr. Mason on December 17th before the Institution of Mechanical Engineers.

Maximum Shear Stress.

It may be now regarded as proved that the maximum shear stress is much more influential than is the maximum normal stress upon failure either by large permanent deformation or by fracture. This idea is not quite new, having been known to mathematicians under the name of "maximum stress difference" theory for a considerable number of years; but it is only now that it is beginning to be recognised as true, or nearly so, and its great importance and proper influence upon the art of designing is hardly yet at all known to engineers.

Experiments in Stresses.

This discovery has necessarily been made by analysis of experiments upon structures subject to "compound stress," i.e., where both normal and shear stresses are involved in large degree.

In each part of a structure or machine it is generally possible to choose a section upon which easily ascertainable stresses act, the normal and shear stresses being separately calculated, and very often caused by separate load-actions. From these it is possible to calculate the "principal stresses," that is, the normal stresses upon sections on which the shear stress is zero. The largest of these principal stresses (of which there are three at right angles to each other) is the greatest stress occurring on any section in that part of the structure. In all the textbooks the demonstration and calculation of these principal stresses are expanded in algebraical forms, which to most students are very tedious and difficult; so much so that all clear idea of the physical phenomenon being investigated is too often lost before the student has struggled to the end of the proof. An admirably simple demonstration is given in Cotterill's "Applied Mechanics." As a clear and exact idea of these stress relations is essential to any considered judgment upon the new developments, there is here given an extremely simple and rapid graphic construction which enables the calculation to be made in a minute or two, and which shows the various relations exceedingly plainly. So far as the writer knows, this construction is new, having been worked out by him for the purpose of this article.

The New Method.

In Fig. 1A is shown a small cubic block on whose four surfaces act the ascertained shear stress s, and on whose two opposite faces act the ascertained normal stress p. These are supposed to be the only stresses acting on the block. In Fig. 1B is shown the stress diagram. The shear stress s is set off to scale horizontally as nk, and the normal stress p set off to same scale vertically, as kh, from one end of s. Then p or kh is bisected in c, and from c as centre with cn as radius, the semi-circle mnl is drawn on the diameter ml coinciding with kh prolonged. Finally, join mn and nl. This is the whole construction, giving complete information.

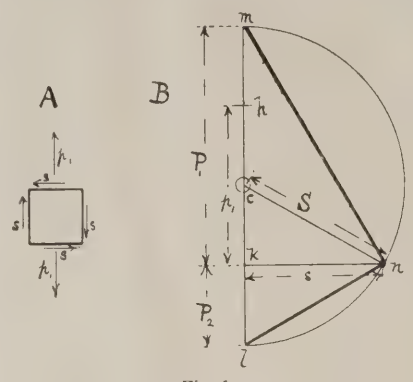

Fig. 1.

The line mn gives the direction of one maximum or principal stress; ln that of the other. Their two magnitudes are $P_1 = +mk$ (tension) and $P_2 = -kl$ (compression), these acting on sections lying in the respective directions ln and mn. The maximum shear stress S is measured to scale in magnitude by cn=cm=cl, and acts upon the sections at 45° to those of the principal stresses, that is, bisecting the right angle mnl.

This is not the place to demonstrate the accuracy of this construction; but the proof is easy.

Fig. 2B gives the similar stress diagram for the case of a shear s combined with two normal stresses p_1 and p_2, on rectangular faces, both p_1 and p_2 being here taken + or as tensions. The construction applies equally to cases where these are of opposite signs. Fig. 2A diagrams this distribution of stress upon a small cube of material.

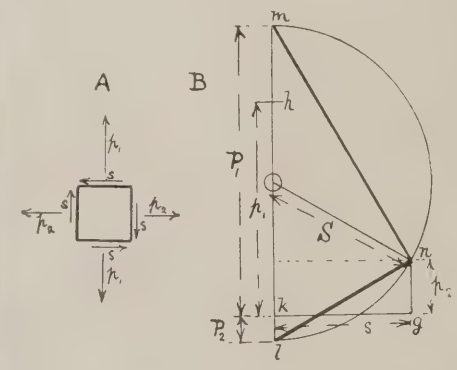

Fig. 2.

The shear s is scaled off as before, as kg, and from its two ends are erected perpendicularly the scaled lengths representing p and p_2, as kh and gn, both in the same direction, as here, if of the same sign, but, if of opposite signs, then one upwards and the other downwards. The difference of the heights p_1 and p_2 is bisected in c; i.e., $hc = \frac{1}{2}(p_1 - p_2)$. From c as centre, with radius cn, the semi-circle mnl is drawn upon the diameter ml, upon the prolongation of kh. Here the maximum normal, or principal, stresses lie in the directions mn and ln, and their magnitudes are $P_1 = +mk$ and $P_2 = -kl$, a compression, in spite of p_2 being a tension. If l lay above k, then P_2 would be a tension. P_2 may be a tension if the shear s is small in comparison with the normal stress: it is so, in fact, if $s^2 < p_1, p_2$. This is illustrated in Fig. 4, which should be compared with Fig. 2. The magnitude of the maximum shear stress S is scaled by $cn = cm = cl = \frac{1}{2}(P_1 - P_2)$, and the planes on which it acts bisect the directions mn and nl.

It may now be noted that Fig. 1 is only a particular case of Fig. 2. Fig. 3 illustrates the case of p_1 and p_2 being of opposite sign. This Fig. 3 shows graphically that P_1 and P_2 cannot be of the same sign if p_1 and p_2 are of opposite signs. Otherwise, if p_1 and p_2 are of opposite signs, their product must be negative, and S^2 cannot be less than $p_1 p_2$.

Another 3-Dimensional Diagram.

A similar equally easy stress diagram giving the three principal stresses and the maximum shear stresses can be made for three-dimensional stress, the diagram being constructed in plan and elevation after the method introduced by the present writer in his 1889 paper in Proc.I.C.E. and subsequently developed in his book on Graphic Calculation (Longmans, 1889).

Simple consideration of the diagrams Figs. 1 and 2 shows that, in any case of pure shear unaccompanied by normal stress upon either of the rectangular sections of the shear, that is, $p_1 = 0$ and $p_2 = 0$, the principal stresses are on the sections at 45° to those of the shear, and are each equal to $s = P_1 = P_2$ one being a tension and the other a compression.

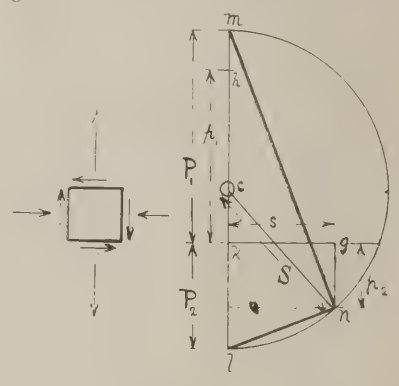

Fig. 3.

This is not the only way in which pure shear arises. To each of these equal and opposite principal stresses may be added an equal amount—so that their difference remains unchanged—without altering the shear. In fact, as above mentioned, there is always pure shear on the sections at 45° to the principal stresses, and its amount is $\frac{1}{2}(P_1 - P_2)$.

Nature of Proof.

These stress relations are proved without any regard being paid to the geometrical strains which accompany them; they are strictly true in whatever way the material is deformed, and whether the strain be small or great. But in applying them to strained material it must be borne in mind that they establish stress-relations between various sections in the deformed shape, not between the same sections (sections containing the same particles) in the original unstrained shape. So long as the strains are very

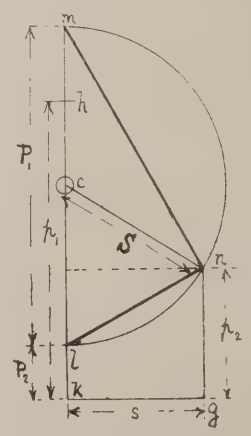

Fig. 4.

minute, there is no appreciable error in applying them either to the strained or unstrained shape indifferently. When the strains become large, however, the error in such application may become important.

Large Strain Effects.

Thus when a rod is stretched by a pull P, its cross-dimension decreases in a ratio usually called Poisson's ratio: the ratio of elongation being e, and that of cross-contraction ηe Thus the cross-sectional area is decreased in the ratio $(1-\eta e)^2$. The tensive stress calculated on the original unstrained section is P, and there may be considerable difference between P and $P/(1-\eta e)^2$. For small strains $\frac{1}{(1-\eta e)^2}$ approximately $(1+2\eta e)$. For engineering materials η lies between $\frac{1}{3}$ and 1·5. With $e=.1$ and $\eta=\frac{1}{4}$, we have $(1+2\eta e)=1.05$, or 5% increase of the stress. The exact figure is 1.0519.

Inexactitude of Ordinary Formulæ for Shear Stress and Strain.

Again, if, under a pure shear stress s, there be a shear strain γ, the 45° diagonal sections are changed in area, the one in the ratio $\left(\cos\frac{\gamma}{2}-\sin\frac{\gamma}{2}\right)$ and the other in the ratio $\left(\cos\frac{\gamma}{2}+\sin\frac{\gamma}{2}\right)$; while the normal forces acting on them are changed in the ratios $\left(\cos\frac{\gamma}{2}+\sin\frac{\gamma}{2}\right)$ and $\left(\cos\frac{\gamma}{2}-\sin\frac{\gamma}{2}\right)$. Thus the principal stresses are no longer each of magnitude s, but the tension becomes approximately $s(1+\gamma)$, and the compression $s(1-\gamma)$. But this tension diminishes further the section it acts upon in the ratio $\left(1-\eta\frac{s}{e}\right)$; and the final result is approximately that the principal tension is $s(1+\gamma)\left(1+\frac{\eta}{1+\eta}\frac{\gamma}{2}\right)$ while the principal compression is $s(1-\gamma)\left(1-\frac{\eta}{1+\eta}\frac{\gamma}{2}\right)$

To illustrate, let $\gamma=.1$ and $\eta=\frac{1}{4}$; then $P_1=s(1.1+1.01)=1.1115$ and $P_2=0.9015$. The more exact figures are 1.115 and 0·8966, or 11½ and 10½% different from the text-book results for minute strains.

In the mathematics of elasticity, similar calculations have for long past been made of the relations between strains of various kinds, and on sections lying in different directions. Thus the maximum shear strain is shown to be on the 45° planes, which are subject to the greatest shear stress. Here again, however, the published calculations stop short at the application to very minute strains. Thus, when the two principal elongations are e_1 and e_2, the maximum shear strains on the 45° planes are always given as $(e_1-e_2)(1+\eta)$. But to find the true result for strains that are not minute there must be used the more exact formula.

$$\text{Max. Shear Strain} = (e_1-e_2)(1+\eta)\,\frac{1+\frac{1}{2}(e_1+e_2)(1-\eta)}{(1+e_1-\eta e_2)(1+e_2-\eta e_1)}$$

To illustrate this, take $e_1=.1$ and $e_2=.05$ and $\eta=\frac{1}{4}$. The ordinary formula would give the shear—.0625. But the complete formula requires this to be multiplied by .9576, yielding .0592, or 5¼% less than the less exact figure. The difference may be again illustrated in a case of principal strains of opposite sign; for example $e_1=.1$ extension with $e_2=-.05$ contraction and $\eta=\frac{1}{4}$. Here $(e_1-e_2)(1+\eta)=.1875$. The true formula gives this mutiplied by .9898, or only 1% less than the approximate calculation. If the opposite strains be of equal magnitude, $\pm e$, the simpler formula gives the shear strain $2e(1+\eta)$, and the exact one gives this divided by $\{1-e^2(1+\eta)^2\}$. With $e=\pm.1$, the former yields .25 as shear strain, but this ought to be multiplied by 1,.016. Thus the rule for every minute strains exaggerates small shear strains and makes large shear strains less than they really are.

When one of the normal strains $e_2=o_1$, the formula reduces with close approximation to $e_1(1+\eta)\left\{1-\frac{e_1}{2}(1-\eta)\right\}$. With $e_1=.1$ and $\eta=\frac{1}{4}$, this yields $.1\times1\frac{1}{4}\times.9625=.1203$, instead of .125.

Nature of Normal Strains.

It must be understood that the normal strains e_1 and e_2 used in the above calculations are not those that actually result. They are those due to the normal stresses p_1 and p_2, each acting alone. The actual extensions in the two principal directions are $(e_1-\eta e_2)$ and $(e_2-\eta e_1)$, or $\frac{1}{E}(p_1-\eta p_2)$ and $\frac{1}{E}(p_2-\eta p_1)$ for isotropic material.

Constancy of Shear Stress at Failure.

The records of recent experiments show a decidedly nearer approximation to constancy of shear stress than to constancy of normal stress at incipient failure. But most of them also show a decided deviation from the former towards the latter law. The discrepancy is too great in well-authenticated series of tests to be accounted for by the above-explained differences between approximative and exact theory. Because the above numerical illustrations are taken, in order to show visibly the effects of the corrections, on very large strains, which are far beyond the "yield-point" of ordinary materials. If, for example, the strains were taken $e_1=.01$ and $e_2=.005$, instead of .1 and .05, the corrective factor would be .9942 instead of .9476, that is ½% instead of 5¼%.

Objections to Maximum Shear Limit.

Again, one of the objections raised to the maximum shear limit strength is that the approximate formula makes the limit depend solely upon the difference of the two principal normal stresses. It is argued that this would allow of these two stresses being indefinitely increased to prodigious amounts without leading to any increase of danger of tracture. This is illustrated in Fig. 4. To examine whether the corrective factor here given explains this anomaly, we may consider the following set of examples, in which the strain-difference is throughout .05, and the value of $\eta=\frac{1}{4}$, so that $(e_1-e_2)(1+\eta)=.0625$ in all cases. The corrective factor is here called k.

e_1	e_2	e_1-e_2	k	.0625k
+.15	+.10	·05	.9148	.05718
+.10	+.05	·05	.9476	.05923
+.05	0	·05	.9798	.06125
+.025	—.025	·05	1.0010	.06256
0	—.05	·05	1.0227	.06392
—·05	—.10	·05	1.0607	.06629
—·10	—.15	·05	1.1048	.06905

If the extreme strains in this table were elastic strains in a material having the very ordinary elastic modulus of 10,000 tons per sq. in., the corresponding stresses would vary from 1,500 tons per sq. in. in tension to 1,500 in compression, both impossible stresses, and yet this range shows only a variation 9½% up and down of the maximum shear strain, and, therefore, of the maximum shear stress.

The Objection Answered.

The above objection is illogical, and the true answer to it is that there must certainly be fracture-limits to the normal tension and compressive stresses which would cause failure independently of what the shear stress may be; but that in ordinary engineering practice these limits are not reached; in such practice the shear-failure limit is nearly always reached first. In compression the superior normal stress limit is certainly very high; as is proved by the extreme difficulty of fracturing a truly spherical ball of homogeneous material under hydraulic pressure, where the three-dimensional symmetry eliminates all shear. That the superior tension-limit actually exists is proved by the bursting of a spherical balloon of thin material under gas pressure. Here the radial compression is very small, and the problem is really a two-dimensional one of complete symmetry, and, therefore, again zero sheer.

Limit of Elasticity.

At the outset it was said that the common definitions (or want of definition) of "perfect elasticity," and of the "limit of elasticity," were unsatisfactory, and require closer examination.

In the first place, no experimental records worthy of the title of sound evidence exist that Poisson's ratio η remains constant for small and large elastic strains. The notion of this ratio is based solely upon a very few accurate measurements of it for particular strain-values: there is no real evidence, at least none of sufficiently extensive range, to show that strict linear proportion is maintained between stress-elongation and lateral contraction as the elongation is gradually increased from zero to the elastic limit.

(To be concluded.)

WOOLWICH FOOTWAY TUNNEL.

At present the only facility for crossing the river at Woolwich, for either vehicular or pedestrian traffic, is the Woolwich Free Ferry, as the nearest communication north and south is the Blackwall Tunnel, about three miles westward. The Council maintains a 24 hours' service with the ferry, the frequency of the crossings varying from ten minutes during the greater part of the day to 30 minutes during the early hours of the morning. It is anticipated that a footway tunnel will enable the hours of the ferry service to be shortened, reducing the annual expenditure involved in the maintenance of the ferry by £6,500. It is expected that at the end of 60 years, when the capital charge is liquidated, the cost of maintaining the tunnel will amount to about £2,500 yearly, thus effecting an economy of £4,000 on the ferry service. The committee, having considered the question from its various aspects, resolved that application be made to Parliament for the necessary powers, which were obtained on August 16, 1909. The contract for the work has now been placed with Messrs. Walter Scott and Middleton., Ltd., for the sum of £78,860.

In the construction of the tunnel the Greathead shield will be employed, and it is interesting to note that in 1874 Mr. Greathead designed a shield for the building of a tunnel at the spot which is now selected. However, owing to the use of compressed air not having been sufficiently developed at that time in connection with work of this character, that scheme was abandoned. The tunnel will be constructed under the Thames almost immediately beneath the place where the free ferry plies from bank to bank. It will be 1,655ft. in length, and 11ft. 9ins. inside and 12ft. 8ins. outside diameter, while the headway will be 8ft. 9ins. above the floor, which will be 8ft. 9ins. wide. The top of the tunnel will be about 58ft. below Trinity high water mark, rendering it possible for the Port Authority to dredge a channel 51ft. 6ins. below Trinity high-water for a width of 500ft. at the bottom. From the north side there will be a descending gradient of one in 21.2 for a total of 212ft.; the tunnel will then be built on the level for 130ft., after which there will be rising gradients to the south side of 1 in. 345 for a distance of 690ft., 1 in 41 for 430ft., and 1 in 17.3 for 173ft. The tunnel will be constructed of eight 1⅛-in. cast-iron segments, and a key, with an inside lining, 10½ins. thick, of 4 to 1 concrete, finished with tiles in the ordinary manner. Beneath the floor there will be two ducts, with removable covers, and each duct will accommodate a group of six 3-in. electric conduits, water hydrants, etc. The water employed for cleansing purposes will be drained to a sump, from which it will be lifted to the surface by means of two pumps driven by electric motors.

Entrance to the tunnel will be afforded by vertical shafts, one at each end, built with

the aid of compressed air, to a depth of 63ft. on the north and 51ft. on the south side of the river. They will each have two steel linings placed 3ft. 6ins. apart, the intervening space being filled with concrete. The outside lining will be 34ft. 4ins. in diameter, and the inside one will be 27ft. 4ins. The shafts will then be lined with brickwork, affording a clear internal diameter of 25ft. Two spiral staircases, one for access and the other for egress, will be erected in each shaft, and sufficient space will be left to render possible the provision of small lifts, should such additional facilities be found necessary. Each shaft will be covered by small circular brick edifices.

The work has been designed by, and will be executed under the supervision of, Mr. Maurice Fitzmaurice, engineer in chief to the London County Council. It is expected that the undertaking will be completed in about two years.

LONDON S FINEST CLUB.

When the new Royal Automobile Club, now being erected on the site of the old War Office in Pall Mall, is completed, it will be the largest club house in London.

The façade, which has a frontage of 228ft., and is in the modern Renaissance style, will have a fine monumental effect, and will make a conspicuous addition to London's street architecture.

On entering, the whole scheme is dominated by the large central vestibule, which is 48ft. by 32ft., with a colonnaded gallery on the first floor, and around this all the different departments are grouped.

The swimming bath, with a pool measuring 75ft. by 30ft., Turkish baths, and gymnasium occupy the lower basement, where there are also three racquet courts, dressing rooms, and servants' dining rooms.

Three immense rooms take up the ground floor, namely, the lounge and lecture-hall, which is 108ft. long by over 40 ft. wide, and the dining-saloon and the club-room, both of which measure 93ft. by 35ft.

The billiard-rooms (five tables in all), card-room, library and various committee-rooms, as well as the touring department, are on the first floor, while on the three upper floors there are more than 150 bedrooms and offices.

The building is being pushed on with all possible speed, and it is hoped to have the work completed before the end of the year.

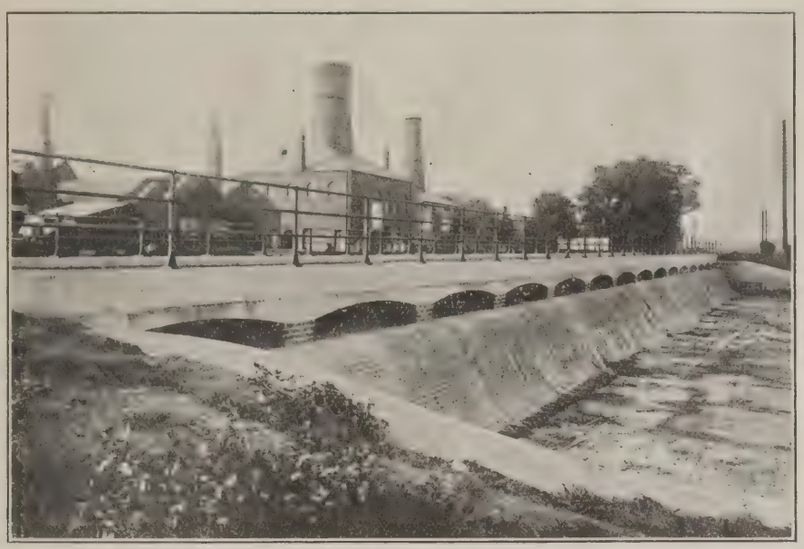
Plans and elevations of the club appear in our Special Issue dated December 31st., 1909.

£36,000,000 FOR PARIS IMPROVEMENTS.

A Bill authorising the city of Paris to contract a loan of £36,000,000 for the embellishment and the sanitary improvement of the capital has passed the French Chamber by 358 votes to 33.

This will be the largest loan contracted by Paris since the year 1870. The programme which is being submitted for execution is also the most ambitious that has been brought forward for a long time. Complaints have been rife as to the neglect into which certain municipal services have fallen. The streets are not kept so tidy as they used to be. Entire blocks of the poorer class of dwellings are admittedly hotbeds of infection. The improvements which were planned years ago have not been carried out. Many a public garden and open space which was necessary to the health and well-being of its inhabitants has been encroached upon or entirely used up by the enterprising builder.

Among a host of proposed improvements will be the termination of the Boulevard Haussmann, with a large square at the end, which will be the Boulevard des Italiens and the Rue Drouot, with splendid houses all round. Old public buildings will be replaced by new ones.



Whole streets of squalid dwellings will disappear, and on some of those sites public gardens will flourish. Thanks to the ready means of transport, workmen will be able to live quite outside the city. £60,000 is to be devoted to the re-paving of streets, and £40,000 to new promenades and squares. Municipal buildings will be repaired or rebuilt. Nearly £1,500,000 is to be spent on the battle against tuberculosis, and almost £4,000,000 is included in the programme to cover past and future expenditure on the improvement of school buildings. The great central markets are also to be finished, and access to them is to be rendered more convenient.

METROPOLITAN WATER BOARD.—NEW RESERVOIR AT CHINGFORD.

In connection with the general scheme for the above, a great deal of reinforced concrete work was involved in the construction of bridges, parapet walls, water towers, etc. The accompanying illustrations show views of some of the bridges in course of erection, also the completed public road bridge over the overflow to the River Lea diversion. The spans vary from 56ft. to 25ft. There are two 56ft. span foot-bridges, and in connection with these, piling had to be resorted to, as conveyance of the centering to the work had to be carried on after the River Lea had been diverted into the new channel. The reinforcing to the bridges consists of mild steel rods of varying diameters. Altogether there are seven bridges, and five of them are already completed. The Columbian Fireproofing Co., Ltd., are carrying out the construction of all the bridges and other reinforced concrete work, and the general contractors are Messrs. C. Wall, Ltd.

Obiter Dicta.

Art and Life.

I do not believe that until you get life back into the city you can possibly get life back into the art school. I look upon idealism as one of the most practical necessities of life; and a city—a great manufacturing city above all—needs this imaginative side of life as a part of its necessary existence.—*Mr. William Rothenstein, interviewed by a representative of the "Morning Post."*

Official Furniture.

There is something peculiarly depressing about official furniture. However much the Office of Works may spend on the new furniture of a room, it remains the same solemn, matter-of-fact, unsympathetic wood and leather that has been superseded. I think one of the main reasons why we are governed with so little imagination and insight is that the work of governing has to be done under the chilly and austere shadows of such unlovely mahogany and oak. Entrap into your official room the most ardent young civil servant fresh from the University, full of ideas and ideals; three years' servitude with Office of Works furniture, and his ideas have moulted away, leaving him a mere featherless permanent official.—*His Honour Judge Parry, in the "Cornhill Magazine" for January.*

Presentable and Pleasing, or Plain and Ugly?

After all, it costs very little more to put up a presentable and pleasing structure than it does for one plain and ugly. We agree that utility should be a pre-eminent thought in the designs for houses and tenements. Yet the people who are to live in these places will be none the worse for artistic surroundings, and the man who can bear both points in view is the one who will best serve future generations. We admit the enormous land values of the metropolis prevent architects doing all they desire as regards dwellings for the people. But this drawback does not prevail to the same extent in the provinces; and where considerable areas of land are purchased with the view of future development, it should be easy to secure adequate provision for suitable environment. The higher the standard, the better for the people.—*Sanitary Record.*

"Isolating the Enough."

'In Venice I catch myself trying to *isolate*, if I may use such an expression, the *enough*. I have to realise the charm of one detail, to live through one suggestion (the rigging and mirrored keel of a single boat, or the grace of a single house, or the perfection, say, of one piece of stone lattice-work or framed marble slab in the narthex of St. Mark's), before I can live it into my own life and keep it as mine.—*Vernon Lee, in "The Westminster Gazette."*

The Profession and the Art.

While we rightfully devote much time to those matters which relate to architecture as a profession, we must not neglect its development as an art. Scholarship, intellectual achievement, scientific research, and, above all, the art of design, are, and always will be, of the first importance to this organisation [the American Institute of Architects].—*Mr. Cass Gilbert's presidential address.*

Town Planning.

The real hope of the future [with respect especially to street architecture] lies in our students, whose education to-day is receiving more consideration than it has ever done before; the methods of the great academies of France and America are being adopted in our schools. This alone, however, is insufficient if that education is not extended in some way to the general public. They hold the purse-strings, and how wisely they open them may be judged by the fact that three-quarters of the building done to-day in England does not rank as architecture at all. Town-planning from an æsthetic point of view has been en-

NEW RESERVOIR WORKS AT CHINGFORD FOR THE METROPOLITAN WATER BOARD.

View showing Columbian reinforcement for bridgework.

tirely neglected in this country, but now there seems a likelihood of its entering into all future schemes of development. Architects have awakened to this, and are preparing to further it by the acquirement of its peculiar knowledge, and several sumptuous books on the subject have recently been published by members of the architectural profession. The great work done in France and America in this matter must give pause to all who think at all of these things, and we hope to see soon the stigma attached to our inaction removed. Kingsway is our first serious attempt since Waterloo Place and Regent Street were laid out, but this was only half-hearted.—*Mr. J. M. W. Halley, in the "Evening Standard."*

Apprenticeship.

Unfortunately the principle of apprenticeship has been rather in abeyance in the country, but, speaking for the industrial centre of the Midlands, I am glad to say we are beginning to realise the essential importance of apprenticeship, which is the only way to teach youth true and efficient workmanship. —*The Lord Mayor of Birmingham at a meeting of the Worshipful Company of Plumbers.*

Appreciation of Domestic Work.

For a long time the study of architecture in this country was practically limited to two branches, namely, churches and cathedrals, or municipal and other public buildings. Of recent years, however, there has arisen a growing recognition of the fact that domestic architecture is not less worthy of consideration, alike on grounds of historic interest and of æsthetic value.—"*Morning Post.*"

Proposed New Works.

ABERDEEN.—Six sets of plans, for the erection of a self-contained dwelling house, two houses each, for two tenants, and alterations to the ground floor of the Palace Theatre, have been submitted to the Town Council. The estimated value of the work is £4,260.

COVENTRY.—The following plans have been approved by the Council:—Amended plan, Spencer Park Estate; six houses (amended), Sir Thomas White's Road; two houses, Crabmill Lane; six houses, Broadway, Earlsdon; three houses and shops, Queen Victoria Road; six houses, Mayfield Road; house, Caludon Road; five houses and house and shop, Folly Lane; motor garage and stores, Upper York Street; eleven houses, Mayfield Road; additions to factory, Cheylesmore; two houses (amended), Spencer Avenue; twenty houses, St. Agatha's Road.

FENTON.—Among the plans recently approved by the Council are the following:—Proposed bridge at Carter's Crossing, over the North Staffordshire Railway; sixteen houses in Church Street, two houses in Station Road, and eight houses in Canon Street.

GLASGOW.—The Dean of Guild Court have granted, among other linings the following:—The North British Locomotive Company, to erect buildings at the Atlas Works, Edgefauld Road, Springburn; Sir Wm. Arrol and Co., to erect a new erecting shop and chimney at works in Preston Street; Riverside Milling Co., Ltd., Kingston, to erect an intake house and hand conveyer at Springfield Quay; The North British Locomotive Co., to erect buildings at Hydepark Works, Fleming Street.

GOUROCK.—The new garden suburb which is contemplated here will occupy an area of about thirty-eight acres. Plans have been prepared for the erection of 600 houses, each of which will comprise four or five rooms, with bathroom, scullery, etc., to be let at an inclusive rent of 10s. per week. Messrs. Salmon, Son, and Gillespie, of Glasgow, are the architects.

ISLEWORTH.—The following plans have been approved by the Council:—Four shops with dwelling-houses, Heston Road, Lampton; one house, Albert Road, Hounslow; four semi-detached villas, College Road, Isleworth; six cottages, Clare Road, Hounslow; additions to Stanley House, St. Stephen's Road, Hounslow.

LONDON.—At a meeting held recently at the Ladbroke Hall, in support of the proposed Jewish Hospital, it was decided strongly to support the movement, the sum casually mentioned as the probable cost of the building being £40,000.

LONDON.—At the meeting of the Tottenham Urban District Council, to be held on the 18th inst., the question of the erection of a large factory on a site 2½ acres in extent, for a German manufacturing firm, is to be introduced. Mr. Clifford Tee, architect, of Moorgate Street, is conducting the negotiations.

SCARBOROUGH.—Messrs. Russell and Cooper, architects, of London, have submitted plans for the widening of the Promenade, the provision of a new bandstand, and the construction of a combined covered-in and open-air café on the Promenade. The whole scheme of improvement is to be carried out for a sum amounting approximately to £3,850.

WATFORD.—The Urban District Council have passed the following plans:—Two pairs of villas, Pinner Road; alterations and additions to bakery, Villiers Road; new shop front, 100, High Street; additions in rear of No. 179, High Street; new Picture Theatre, the Market Place; four houses, Leavesden Road; twelve cottages, Benskin Road; five houses, Carey Place; two houses, Sydney Road; new cottage, Cecil Street.

Recognition of the fact that Mr. Max Clarke is not only Mayor of Holborn, but also a prominent member of the Royal Institute of British Architects, was made at the headquarters of that body, when he was presented by the members of the Science Committee, of which he is chairman, and of the Practice Standing Committee and the Council, of both of which he is a member, with a handsomely illuminated address of congratulation on his election to the Mayoralty of Holborn, and thanking him for his services for the advancement of the architectural profession. The presentation was made by Mr. W. H. Atkin-Berry (chairman of the Practice Standing Committee), and the address contained thirty-six signatures. Mr. Max Clarke is the third member of the Practice Standing Committee of the Royal Institute of British Architects who has occupied the position of Mayor of Holborn.

REINFORCED CONCRETE BRIDGE, SEAHAM HARBOUR.

REINFORCED CONCRETE BRIDGE, SEAHAM HARBOUR.

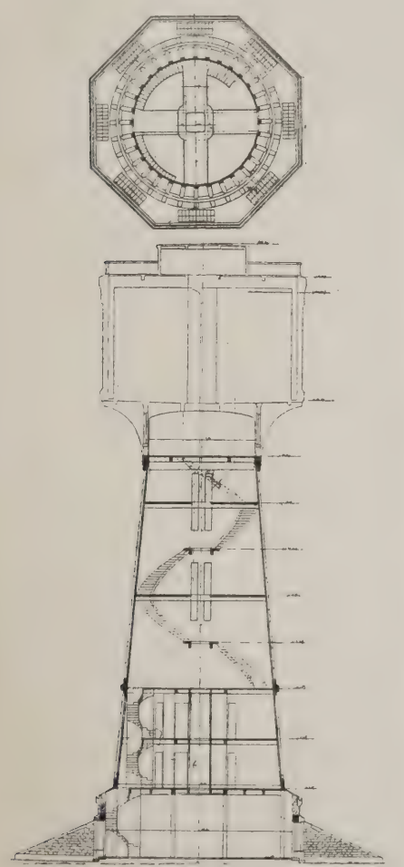
The bridge here illustrated has just been completed to the order of the Marquis of Londonderry, and crosses the South Hetton and N.E. Railway Co.'s lines at Swine Bank Lodge, Seaham Harbour, co. Durham. It is entirely constructed in concrete reinforced with indented steel bars supplied by the Patent Indented Steel Bar Company.

The bridge has a span across the railway of 42ft. 6ins. clear, and a roadway width of 26ft. The deck of the bridge is 8ins. thick, and is carried by five beams, each 27ins. deep, and 11ins. wide. The abutment walls are 6ins. thick, supported by counterforts 4ft. 6ins. by 11ins., corresponding with and forming a continuation of the beams. The moulded and panelled parapet wall is 4ft. 6ins. high, springing from a 9-in. moulded cornice, and finished with 9-in. moulded coping.

The bridge was designed by Mr. H. W. Taylor, M.Inst.C.E., engineer to the British Concrete Steel Company, of the Cathedral Buildings, Newcastle-on-Tyne, to carry a rolling load of 30 tons. The test, which was carried out in the presence of various officials of the company, the contractors (Messrs. Geo. Gradon and Son, Durham), the Marquis of Londonderry, and several engineering and other visitors, was conducted with two steam rollers, one of 16 tons and the other of 18 tons. The permissible deflection of 1-600th of the span is 0.85 of an inch, whereas the actual deflections were as follows, namely, 0.098 of an inch with the two rollers side by side at centre of bridge, and 0.074 of an inch with them tandem on the bridge, or less than one-eighth of the permissible deflection. The permanent set when the two rollers were removed amounted to 0.0005 of an inch.

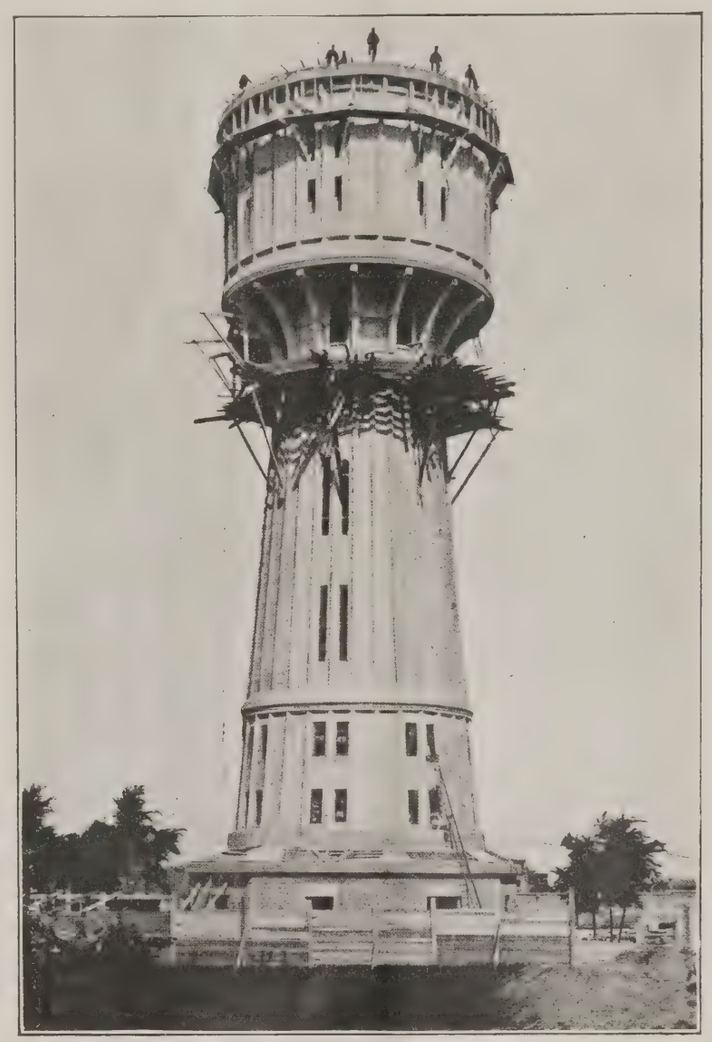
It is announced that as from 30th of December, 1909, the address of the Yorkshire Federation of Building Trade Employers is West Bar Chambers, 38, Boar Lane, Leeds; telephone, Leeds Central, 3935 (J. Davidson, Secretary).

* * *



A carved oak reredos, erected at a cost of £680 and given by Mr. and Mrs. E. J. Wythes, of Copped Hall, Epping, which has been dedicated at a special service at the church of St. John, Epping, has 50 carved figures, the principal subjects represented being the Resurrection, the Ascension, the Lord's Supper, and the Heavenly Choir.

A CONCRETE WATER TOWER FOR THE BRUSSELS EXHIBITION.



There is now nearing completion in Uccle, a suburb of Brussels, Belgium, a concrete water tower of striking and graceful proportions and of interesting construction.

A general idea of the tower is given in the view here shown. The tower is being built by Leon Monnoyer et Fils, concrete contractors, of Brussels, who are also the architects, of the structure, for the International Exposition of 1910. The tower and tank have a height of 145ft., and the latter has a capacity of 280,000 gallons. The structure is circular, and is built entirely of concrete blocks and without moulding of any kind excepting that used in the building of the concrete reinforcing struts surrounding the base of the tank proper. The inside of the tower is built up in practically six storeys, connected by a winding stairway. These different floors are divided into rooms, and these apartments, if they may be so called, will all be occupied by engineers, foremen, and other workmen during the Exhibition. The stairways are placed along the outer walls and the water mains in the centre, and enclosed by a concrete covering of square cross section. The tank will have a concrete top, the centre of which will rest on a continuation of the water mains or pipes. Excellent light is afforded the apartments by the large windows.

The most interesting feature of the structure, apart from its artistic merit, is the manner in which it is built up with the aid of concrete blocks. These blocks are of a new and peculiar design, and are made in a small steel form, usually on the ground where they are to be employed. The blocks were placed in horizontal courses, and were handled from the inside, where a light scaffolding was necessary. The blocks were reinforced with three small round rods, not so much for

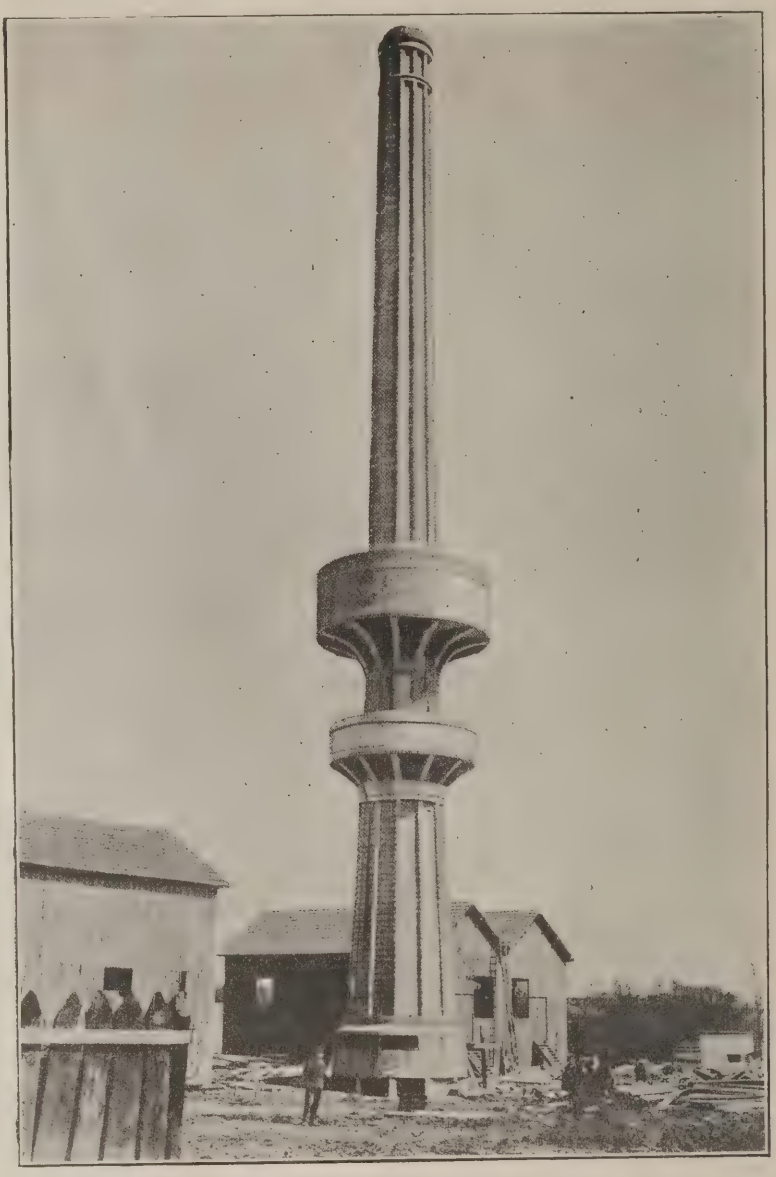
R. Mortar filling.

their permanent reinforcement as to prevent breaking in handling. The number of blocks in each course always remains the same, but they are placed in the opposite direction in each succeeding course. That is to say, the blocks of the even courses will take one direction around the tower, and those of the odd courses will have the opposite direction. In this manner the joining of the blocks of one course, where they do not meet perfectly, will be covered by the blocks above and below. Each block has as one of its extremities a "hook" similar to the U. This hook forms a hollow space which extends the full length of the structure, and, of course, there will be just so many of these hollow spaces as there are sides to the tower, or 32. Through these vertical hollow spaces are placed steel reinforcing rods of circular cross section and varying in diameter according to their location in the structure. This is not the only reinforcing which the blocks have, however, as there is a series of small rods placed on top of each course and extending around the entire 32 blocks in the course.



There are used only two or three sizes of blocks for the entire structure, although it has a considerable taper. In other words, the taper of the tower is taken up in an ingenious manner by utilising the hook in the blocks. The ends of the long arms of the blocks of the first course are placed just to the inside of the hook in the block next to it, and then in the next course the arms are placed a little farther into the hooks, and so on until the top is reached. Thus each succeeding course has a slightly smaller diameter than the one preceding it.

Our Plate.

Dalchroy, Advie, Strathspey.

This house was built as a fishing and shooting lodge, and occupies an ideal position on a lofty plateau commanding a fine view of the Spey Valley. The subsoil is rock. A magnificent range of mountains surrounds the whole valley, conspicuous among them being the snow-capped heights of the Cairngorms. In the immediate foreground is a fine reach of the River Spey. This house is built of local whinstone found on the site, and the tower is a commanding feature of the dwelling. In the interior Austrian oak has been largely used, which timber has also been used for the floors. The entrance hall is panelled in oak and the library is panelled with old carved oak. The house is also furnished with antique oak furniture. The lighting is by electricity produced in the power house, which has been built on the estate. The light fittings have been the subject of special consideration, torch forms being used in the hall, standard lamps in the drawing-room, and Jacobean pattern candelabra and brackets in the library. The house is heated throughout with radiators on the low-pressure system, and the most modern electrical devices have been installed for drying clothes and heating appliances. A system of telephones has been installed throughout the residence, and between it and all the out-buildings. The latter include a motor-house and quarters for the men-servants.. The architects were A. Maitland and Sons, Tain, Ross-shire.

The general contracts have been arranged on the Scotch system, each trade being taken by a separate contractor, as follows:—Mason work, Wm. Alexander and Co., Inverness; carpentry, Mackie and Mackenzie, Elgin; slate work, John Wilson, Lossiemouth; plumbing and sanitary work, R. Mackenzie and Son, Dingwall; lath and plaster and concreting, John Munro, Tain; fibrous and modelled plasterwork, Samuel Wright and Co., London; water supply, Alex. Nicholson, Elgin; smith's work, Thomas Gibson and Son, Edinburgh; heating, Mackenzie and Moncur, Edinburgh; electrical work, A. V. Givkins and Co., London; chimneypieces, etc.. Graham and Banks, London; woodblock flooring, Stevens and Adams, London; sculptor's work, D. and A. Davidson, Inverness; painting, Wm. Urquhart, Tain. The following firms supplied materials or carried out sub-contracts:—Glazed bricks, Howie and Co., Kilmarnock; stone dressings, Newton Quarry; Elgin; tiles, Minton, Hollins and Co., Stoke-on-Trent; casements and casement fittings and door furniture, Fletcher, Parker, and McAlpine, Glasgow; sanitary ware, John Bolding and Co., London; stained glass and leaded lights, Heaton, Butler and Bayne, London; gates, railings, etc., Maine and Co., Glasgow; wall-papers, etc., Arthur Sanderson and Co., Ltd., London; strong-room door, Milner's Safe Co., London; furnishing, Hampton and Sons, Ltd., London.

CONCRETE BLOCK CHIMNEY WITH RESERVOIRS OF REINFORCED CONCRETE, ANDERNY, FRANCE.

This chimney is 180 feet high. The large reservoir has a capacity of 100 cubic metres; the smaller one holds 22 cubic metres.

The London County Council have decided to apply to Parliament for authority to construct a subway under the Victoria Embankment to the tramway stopping-place near Charing-Cross Bridge.

* * *

The Preston Town Council have been asked to sanction a recommendation of the Streets and Buildings Committee to advertise for a chief assistant in the Borough Surveyor's department, at a salary of £200 per annum, such assistant to have a practical knowledge of engineering, both civil and mechanical, and some knowledge of the work of a borough surveyor's department.

THE BURSLEM MUNICIPAL BUILDINGS SCHEME.

A town's meeting convened by the Burslem Town Council on the question of the proposed new municipal buildings, has been held with the object of considering the following resolutions passed by the Town Council on December 6th:—"(1) That the Town Council provisionally approve of the plans for the erection of new municipal buildings at a cost of £25,000 for the buildings, and £2,750 for fittings and furniture, architect's commission, and other expenses; (2) that a public meeting of the burgesses be held to discuss the question and to decide whether a poll shall be taken." The meeting was confined to ratepayers who had previously obtained tickets of admission, and numbered between 400 and 500. A previous town's meeting held on November 11th decided against the scheme, and demanded a poll.

The scheme having been explained by Alderman Malkin, Mr. John Randell proposed as an amendment:—"That this meeting expresses its indignation at the contemptuous manner in which the Council have treated the desires of the ratepayers, and are determined that a poll shall be taken as decided by an overwhelming majority on November 11th."

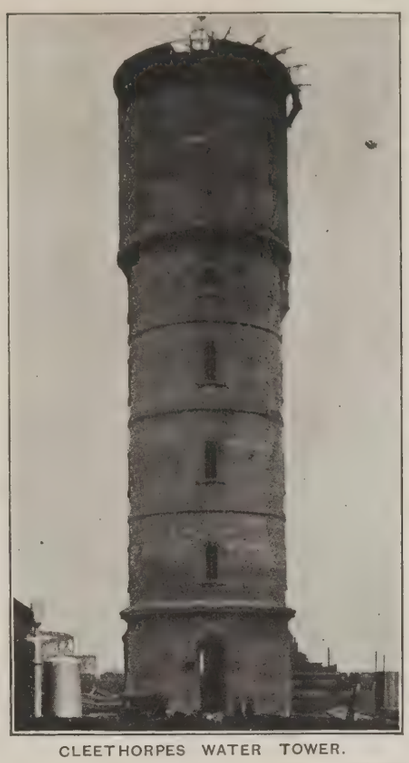
The Town Clerk (Mr. Arthur Ellis) said he had advised the committee to take the opinion of a gentleman whom he considered the greatest authority on Local Government Law in this country — Mr. Alexander McMorran, K.C.—and he had given his opinion in a very decided manner, that if the new authority declined to raise this money by loan, or if they were unable to raise this money by loan, the whole cost that was not defrayed before March 31st or not provided for by funds in hand at March 31st, would have to be a charge on the whole of the new federated area.

Alderman Malkin, in replying to the discussion, said they were charged with being too lavish. The plans were simplicity itself, and there was no decoration about them that was extravagant. Moreover, he did not agree that there must be extras. There would be no extras worth mentioning on the whole job.

The amendment that a poll be taken was then put to the meeting and defeated by a narrow majority. The Mayor remarked: So far as my opinion goes, the amendment is lost.

Mr. Randell said, as a ratepayer, he demanded that a poll be taken, to which the Mayor replied that if the law said that a burgess had any right to demand a poll, and it was within the legal right of the mayor to order a poll, then there would be no other alternative. But if it was not within his right, then let them not blame him if there was no poll.

PRINCIPLES OF PROFESSIONAL PRACTICE AND THE CANONS OF ETHICS.



The following is the text of a circular that has been issued by the American Institute of Architects. It clearly refers to many matters of principle and practice that are of common interest at home and abroad.

The American Institute of Architects, seeking to maintain a high standard of practice and conduct on the part of its members as a safeguard of the important financial, technical, and æsthetic interests entrusted to them, offers the following advice to professional practice:

The profession of architecture calls for men of the highest integrity, business capacity and artistic ability. The architect is entrusted with financial undertakings in which his honesty of purpose must be above suspicion; he acts as professional adviser to his client, and his advice must be absolutely disinterested; he is charged with the exercise of judicial functions as between client and contractors, and must act with entire impartiality; he has moral responsibilities to his professional associates and subordinates; finally, he is engaged in a profession which carries with it grave responsibility to the public. These duties and responsibilities cannot be properly discharged unless his motives, conduct, and ability are such as to command respect and confidence.

No set of rules can be framed which will particularise all the duties of the architect in his various relations to his clients, to contractors, to his professional brethren, and to the public. The following principles should, however, govern the conduct of members of the profession, and should serve as a guide in circumstances other than those enumerated:

1. On the Architect's Status.—The architect's relation to his client is primarily that of professional adviser; this relation continues throughout the entire course of his service. When, however, a contract has been executed between his client and a contractor, by the terms of which the architect becomes the official interpreter of its conditions and the judge of its performance, an additional relation is created, under which it is incumbent upon the architect to side neither with client nor contractor, but to use his powers under the contract to enforce its faithful performance by both parties. The fact that the architect's payment comes from the client does not invalidate his obligation to act with impartiality to both parties. The architect should not, without authority, assume to act as the owner's agent.

CLEETHORPES WATER TOWER.
This tower is 173 feet high, and carries a steel tank of 250,000 galls. capacity.
(Indented Bar Reinforcement.)

2. On Preliminary Drawings and Estimates.—The architect at the outset should impress upon the client the importance of sufficient time for the preparation of drawings and specifications. It is the duty of the architect to make or secure preliminary estimates when requested, but he should acquaint the client with their conditional character, and inform him that complete and final figures can be had only from complete and final drawings and specifications. If, on the basis of approved preliminary sketches and specifications, definite expenditure has been mutually determined, the architect should bring his working drawings and specifications to meet such cost, provided that the client has requested no departure from the original basis of estimate, and that conditions beyond the architect's control have not arisen. If an unconditional limit of cost be imposed before such drawings are made and estimated, the architect must be free to make such adjustments as seem to him necessary. Since the architect should assume no responsibility that may prevent him from giving his client disinterested advice, he should not, by bond or otherwise, guarantee any estimate or contract.

3. On Superintendence and Expert Services.—On all work except the simplest, it is to the interest of the owner to employ a superintendent or clerk of the works. In many engineering problems and in certain specialised æsthetic problems, it is to his interest to have the services of experts, and the architect should so inform him. The experience and special knowledge of the architect make it to the advantage of the owner that these persons, although paid by the owner, should be selected by the architect under whose direction they are to work.

4. On the Architect's Charges. — The Schedule of Charges of the American Institute of Architects is recognised as a proper minimum of payment. The locality and the nature of the work, the quality of services to be rendered, the skill of the practitioner or other circumstances frequently justify a higher charge than that indicated by the schedule.

5. On payment for Expert Service.—The architect when retained as an expert, whether in connection with competitions or otherwise, should receive a compensation proportionate to the responsibility and difficulty of the service. No duty of the architect is more exacting than such service, and the honour of the profession is involved in it. Under no circumstances should experts knowingly name prices in competition with each other.

6. On Selection of Bidders or Contractors.—The architect should advise the client in the selection of bidders, and in the award of the contract. In advising that none but trustworthy bidders be invited, and that the award be made only to contractors who are reliable and competent, the architect protects the interest of his client.

7. On Duties to the Contractor.—As the architect decides whether or not the intent of his plans and specifications is properly carried out, he should take special care to see that these drawings and specifications are complete and accurate, and he should never call upon the contractor to make good oversight of errors in them, nor attempt to shirk responsibility by indefinite clauses in the contract or specifications.

8. On Engaging in the Building Trades.—The architect should not directly or indirectly engage in any of the building trades. If he has any financial interest in any building material or device, he should not specify or use it without the knowledge and approval of his client.

9. On Accepting Commissions or Favours.—The architect should not receive any commission or any substantial service from a contractor or from any interested person other than his client.

10. On Encouraging Good Workmanship.—The large powers with which the architect is invested should be used with judgment. While he must condemn bad work, he should commend good work. Intelligent initiative on the part of craftsmen and workmen should be recognised and encouraged, and the architect should make evident his appreciation of the dignity of the artisan's function.

11. On Offering Services Gratuitously.—The offering of professional services on approval and without compensation, unless warranted by personal or previous business relations, tends to lower the dignity and standing of the profession, and is to be condemned.

12. On Advertising.—Advertising tends to lower the standard of the profession, and is therefore condemned.

13. On Signing Buildings and Use of Titles.—The display of the architect's name upon a building under construction is condemned, but the unobtrusive signature of buildings after completion has the approval of the Institute. The use of initials designating membership in the Institute is proper in connection with any professional service, and is to be encouraged as helping to make known the nature of the honour they imply.

14. On Competitions.—An architect should not take part in a competition as competitor or professional adviser or juror unless the competition is to be conducted according to the best practice and usage of the profession as formulated by the Institute. Except as an authorised competitor, he may not attempt to secure work for which a competition has been instituted. He may not attempt to influence the award in a competition in which he has submitted drawings. He may not accept the commission to do the work for which a competition has been instituted if he has acted in an advisory capacity either in drawing the programme or in making the award.

15. On Injuring Others.—An architect should not falsely or maliciously injure the professional reputation, prospects, or business of a fellow architect.

16. On Undertaking the Work of Others.—An architect should not undertake a com-

mission while the just claim of a fellow architect, who had previously undertaken it, remains unsatisfied, unless such claim has been referred to arbitration or issue has been joined at law; nor should he attempt to supplant a fellow architect after definite steps have been taken toward his employment.

17. On Duties to Students and Draughtsmen.—The architect should advise and assist those who intend making architecture their career. If the beginner must get his training solely in the office of an architect, the latter should assist him to the best of his ability by instruction and advice. An architect should urge his draughtsmen to avail themselves of educational opportunities. He should give encouragement to all worthy agencies and institutions for architectural education. While a thorough technical preparation is essential for the practice of architecture, architects cannot too strongly insist that it should rest upon a broad foundation of general culture.

18. On Duties to the Public and to Building Authorities.—An architect should be mindful of the public welfare, and should participate in those movements for public betterment in which his special training and experience qualify him to act. He should not, even under his client's instructions, engage in or encourage any practices contrary to law or hostile to the public interest; for as he is not obliged to accept a given piece of work, he cannot by urging that he has but followed his client's instructions, escape the condemnation attaching to his acts. An architect should support all public officials who have charge of building in the rightful performance of their legal duties. He should carefully comply with all building laws and regulations, and if any such appear to him unwise or unfair, he should endeavour to have them altered.

19. On Professional Qualifications.—The public has the right to expect that he who bears the title of architect has the knowledge and ability needed for the proper invention, illustration, and supervision of all building operations which he may undertake. For that and other obvious reasons, such title should not be assumed without adequate qualifications.

The Canons of Ethics.

The following canons are adopted by the American Institute of Architects as a general guide, yet the enumeration of particular duties should not be construed as a denial of the existence of others equally imperative, although not specifically mentioned. It should also be noted that the several sections indicate offences of greatly varying degrees of gravity.

It is unprofessional for an architect

1. To engage directly or indirectly in any of the building trades.
2. To guarantee an estimate or contract by bond or otherwise.
3. To accept any commission or substantial service from a contractor or from any interested party other than the owner.
4. To advertise.
5. To take part in any competition, the terms of which are not in harmony with the principles approved by the Institute.
6. To attempt in any way, except as a duly authorised competitor, to secure work for which a competition is in progress.
7. To attempt to influence, either directly or indirectly, the award of a competition in which he is a competitor.
8. To accept the commission to do the work for which a competition has been instituted if he has acted in an advisory capacity, either in drawing programme or making award.
9. To injure falsely or maliciously the professional reputation, prospects, or business of a fellow architect.
10. To undertake a commission while the just claim of another architect who has previously undertaken it remains unsatisfied, or until such claim has been referred to arbitration or issue has been joined at law.
11. To attempt to supplant a fellow architect after definite steps have been taken toward his employment.
12. To compete knowingly with a fellow architect for employment on the basis of professional charges.

Coming Events.

Wednesday, January 5.

R.I.B.A. Art Committee Meeting.

Friday, January 7.

Birmingham Architectural Association.—Meeting.

Institution of Mechanical Engineers.—Mr. W. R. Eckart on "The application of the Pitot tube to the Testing of Impulse Water Wheels." Mr. C. W. Jordan on "The Power Plant of the Ontario Power Co., at Niagara Falls," 8 p.m.

Monday, January 10.

The Surveyors' Institution.—Mr. J. Willmott on "The Housing, Town-planning Act, etc., 1909." Discussion on Mr. Davidge's paper on "Town-planning Systems," adjourned from November 22, 1909, 8 p.m.

Tuesday, January 11.

University Extension Lectures on Ancient Architecture. — Mr. Banister Fletcher on Roman Architecture (Fora, Rectangular Temples), British Museum, 4.30 p.m.

Illuminating Engineering Society.—Mr. J. H. Parsons, F.R.C.S., on "Glare: Its Causes and Effects," 8 p.m.

Wednesday, January 12.

The Carpenters' Company Lectures.—Professor Beresford Pite on "What is Artistic Craftmanship?" Carpenters' Hall, 7.30 p.m.

Northern Architectural Association.—Council meeting, 7. p.m. Ordinary meeting, 7.30 p.m. Paper by Mr. Frank W. Rich.

Manchester Society of Architects.—Mr. A. E. Corbett on "Concrete and Concrete Tests."

Thursday, January 13.

The Surveyors' Institution.—Students' preliminary examination.

R.I.B.A.—Science Committee Meeting.

Friday, January 14.

The Surveyors' Institution.—Students' Preliminary Examination.

The Architectural Association.—Mr. J. Starkie Gardner on "A Comparison between English and Continental Ornamental Ironwork," 7.30 p.m.

Monday, January 17.

Woolwich House-Owners' Association.—Committee meeting, 7.30 p.m.

R.I.B.A.—Mr. S. D. Kitson on "Carr of York." Award of prizes and studentships, 8 p.m.

Tuesday, January 18.

University Extension Lectures on Ancient Architecture. — Mr. Banister Fletcher on Roman Architecture (Circular and Polygonal Temples, Basilicas), British Museum, 4.30 p.m.

Manchester Society of Architects.—Student's meeting, 6.30 p.m. Discussions on Architecture in general, Mr. J. H. Worthington; chairman, Mr. J. H. Sellers.

R.I.B.A.—Practice Committee Meeting.

Wednesday, January 19.

The Carpenters' Company Lectures.—Mr. M. H. Baillie Scott, on "The Art of Building with special reference to the use and abuse of materials," Carpenters' Hall, 7.30 p.m.

Northern Architectural Association.—Students' meeting, 7.30 p.m. Mr. S. Ash on "A Holiday in Belgium."

R.I.B.A.—Exhibition of Prize Competition Drawings opens at the Alpine Club, and continues until Jan 29.

Thursday, January 20.

R.I.B.A.—Literature Committee Meeting.

Friday, January 21.

Birmingham Architectural Association.—Professor S. D. Adshead on "Tone and Colour in Towns."

Saturday, January 22.

Aberdeen Architectural Association.—Mr. Alex Mcibbon on "Architectural Forms not influenced by material: a Popular Opinion Confuted," 7.30 p.m.

Monday, January 24.

The Surveyors' Institution.—Adjourned discussion on Mr. Davidge's paper, "Town-planning Systems," and on Mr. Willmott's paper, "Housing and Town-planning, etc., Act, 1909," 8 p.m.

Tuesday, January 25.

University Extension Lectures on Ancient Architecture. — Mr. Banister Fletcher on Roman Architecture (Thermae), British Museum, 4.30 p.m.

Wednesday, January 26.

The Carpenters' Company Lectures.—Mr. Banister Fletcher on "The Carpenters' Craft," 7.30 p.m.

Manchester Society of Architects.—Professor S. H. Capper on "Truro."

Saturday, January 29.

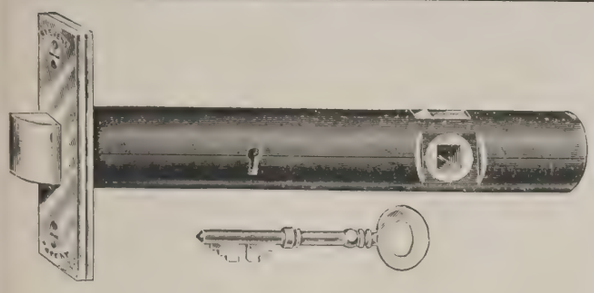
R.I.B.A.—Exhibition of Prize Competition Drawings, at the Alpine Club, closes.

Monday, January 31.

R.I.B.A.—President's address to students. Presentation of prizes and studentships. Announcement of Council's nomination for the Royal Gold Medal. Announcement of nomination of candidates for membership. Election, February 28.

Trade and Craft.

Fitting Up Royal Stables.



The fitting up of stables for royalty is sufficiently rare to make interesting the fact that no less than three contracts for work of this description have been placed with one firm during last year. In the early part of the year, the order for fitting up the stables of H.M. the Queen of Holland was received from the Dutch Government through their architect, Herr Peters, by the St. Pancras Ironwork Co., Ltd. Later in the year the same firm obtained the contract for re-fitting four of the stables at the Royal Mews, Buckingham Palace, and since then they have begun and nearly completed the fitting up of stables at Windsor Castle. The Dutch order was obtained in competition with a great number of firms of various nationalities, namely, Dutch, German, Belgian and French, which may help to reassure those who are nervous about our declining industries. The actual number of standings are 36 loose-boxes and 60 stalls. Several novel features have been designed for those stables by the above-mentioned company, at the wish of the Master of Horse, Herr Reigersberg Versluijs. The contract for the fittings at Buckingham Palace form the third which has been executed by this firm. In the stables at Windsor, paving bricks are still in position which were laid by the self-same firm more than thirty years ago, having lasted all this time without losing their non-slipping quality or showing any considerable signs of wear.

More Light for Interiors.

The MAXimum Light Window Glass Company, of 28, Victoria Street, Westminster, forward for notice a sixty-eight-page catalogue, in which are described their specialities, with copious illustrations, mainly relating to important buildings in which MAXimum daylight glass or the "Cat's Eye Glass" has been applied. It is stated that the firm have fixed more than 30,000 windows in London, and it is claimed that "architects need not have a dark corner in any room if they apply this glass to certain windows." Diagrams show how, by means of scientifically shaped projections on both sides of the sheet, the rays of light are refracted sideways and towards the rear of a room, making an even distribution. The "Cat's Eye Glass" gives artistic appearance, and at the same time permits the entrance of the greatest possible amount of light. It is specially recommended for the glazing of doors, windows, skylights, and partitions.

The Cheapest Lock on the Market.

STEVEN'S PATENT BARREL LOCK

Saves 75% in fixing. Is absolutely reliable. Has no delicate working parts.

TO BE OBTAINED FROM ALL WHOLESALE BUILDERS' IRONMONGERS.

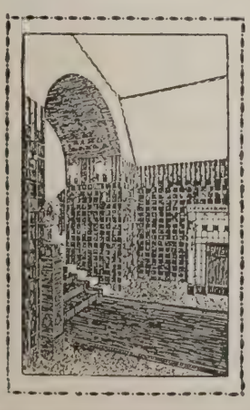
L. & C. HARDTMUTH'S

KOH-I-NOOR PENCIL

is the most economical Pencil made. It lasts six times as long as an ordinary pencil. But it is the velvety smoothness of the lead that is the great charm of the Koh-I-Noor. There is no other pencil that nearly approaches its quality. The lead of the Koh-I-Noor is specially prepared by a perfected process which gives it a firmness yet delicacy of touch that cannot be imitated. The Koh-I-Noor is made in seventeen degrees to suit all pencil purposes.

Koh-I-Noor Pencils are **4d.** each, and **3s. 6d.** per dozen, everywhere. Of Stationers, Artists' Colourmen, Photographic Dealers, &c. Booklet free from

L. & C. HARDTMUTH, 12, Golden Lane, London, E.C.



KOH-I-NOOR TRACING CLOTH

Is a stout and substantial cloth possessing every advantage for the drawing room. Its surface is smooth and clear, free from blotches. Does not tear or break. Is transparent enough for the finest work. Erasures may be freely made without causing the ink to run. Is excellent for giving impressions by process.

THE GREATEST SATISFACTION IN USING THIS SPECIALITY IS FOUND IN ALL DRAWING OFFICES.

Of Stationers, Artists' Colourmen, Photographic Dealers, &c.

L. & C. HARDTMUTH, 12, Golden Lane, London, E.C.

"Modernia" Patent Glass Tiles

give an artistic and novel effect.

No glassy surface. Coloured throughout. Substance about ¼ inch. Any colour supplied. Prospectus, Samples, Estimates and Designs for complete decorations, free.

The "Modernia" Patent Glass Tile Co.

Sole Concessionaires: Aug. Brennecke & Co., 68, Finsbury Pavement, London, E.C.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about **five days** after the date of this issue.
Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders.
The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the Contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Jan. 1-17. **WEST HAM.**—Extension of the existing West Silvertown schools, and erection of the boys' new department, for the Corporation. Contractors are requested to make written application to William Jacques, A.R.I.B.A., Architect to the Education Committee, 2, Fen Court, Fenchurch Street, E.C., for copy of quantities, conditions, and form of tender, not later than Jan. 1. Each application must be accompanied by a deposit of a £5 Bank of England note. Plans and particulars may be seen at the Architect's Office. Tenders at the Education Department, 95, The Grove, Stratford, E. Fair wages clause.

Jan. 1-21. **EXMOUTH.**—Alterations and additions to the Exeter Road Council Schools, Exmouth (boys' and girls' departments), for the Devon County Education Authority. Bills of quantities for the work will be available in due course on deposit of £1 1s. Contracts Open.

WAR DEPARTMENT CONTRACT.

The Secretary of State for War hereby invites Tenders for the following work:—The re-appropriation of A.S.C. Block and erection of additions to provide accommodation for the Royal Army Medical Corps, Millbank, London, S.W.

Plans, specification and conditions of contract may be inspected at the office of the Director of Barrack Construction, 80, Pall Mall, London, S.W., on Monday, Tuesday, and Wednesday, January 3rd, 4th, and 5th.

Those desiring to Tender and to receive a copy of the bills of quantities must apply to the Director of Barrack Construction not later than Friday, January 7th, 1910. The application must be accompanied by a deposit of ten shillings, which will be returned if a bona-fide Tender is received from the applicant. Cheques or orders to be made payable to the Assistant Financial Secretary and crossed "Bank of England for credit to Army Funds."

Tenders, on the form supplied with the bills of quantities, must be delivered in sealed envelopes, marked "Tender for Reappropriation of A.S.C. Block, Millbank, S.W.," not later than twelve noon on Monday, January 17th, 1910, addressed to the Director of Army Contracts, War Office, Whitehall, London, S.W. The bill of quantities should accompany Tender in a separate sealed envelope, similarly addressed and marked, "Bills of Quantities, Reappropriation of A.S.C. Block, Millbank, S.W.," with the contractor's name and address thereon.

The Secretary of State does not bind himself to accept the lowest or any Tender.

(Signed) H. DELA BERE,
Director of Army Contracts.

War Office,
Whitehall, London, S.W.,
December, 1909.

TO BUILDERS.

Trade Improvement.

The returns of foreign trade for December encourage the hope that we have at length emerged from the cycle of depression. The month's imports amounted to £60,786,000, an increase of £3,960,000, or 6.9 per cent., and the exports to £33,790,000, an increase of £4,388,000, or 14.9 per cent. The month therefore shows a decided improvement on the bad December of 1908, and is even better than the same month of 1907. For the whole year 1909, the imports were £624,740,000, an increase of £31,787,000, or 5.3 per cent., and the exports £378,379,000, an increase of £1,275,000, or 0.3 per cent. The year, therefore, which seemed certain, on the showing up to the end of October, to fall below 1908, has, on its records for November and December, come out with a welcome increase. This is surely excellent news for all sorts and conditions of builders, who, if this rate of progress is maintained, may hope to share in the general prosperity. Whether they do or do not depends very largely on the degree of confidence which may return to the investor and the capitalist; but one may be fairly hopeful that when the General Election is over and done with, the property market will quickly recover its tone, and that, as a consequence, building operations will proceed at something more like the normal rate.

The Broader View.

It may be taken for a healthy sign that the leading British newspapers, magazines, and other periodicals are showing so much interest in architecture. The articles on the subject that appear with increasing frequency in the lay Press are, for the most part, naturally what is euphemistically termed "popular" in style and treatment; but they are better than nothing, and, while they may not convey much information to the architect and the builder, they must inevitably tend to increase the intelligent interest of a hitherto profoundly apathetic public. In this respect the "Times," in particular, may be supposed to be rendering excellent service. Its articles on architecture and cognate subjects appear at fairly short intervals, and are almost always thoroughly sound, as well as being "readable"—that is to say, they are free from the technicalities that could only baffle and bewilder the general reader, yet they are not purely journalistic. Not long ago, "An English Architect" was allowed to occupy fully two columns with an interesting account of the architecture of Buenos Ayres. The city, he shows, is not without interest for the students of town planning, in whose behalf, as our journal has been quick to recognise, the field of enquiry may be profitably expanded far beyond the old narrow limits. Whereas formerly the British architect was apt to be somewhat impatient of the exhibition and description of foreign examples, he is now eager to find out all he can as to what is being done abroad, and we have not been slow to minister to this growing recognition of the truth that art is cosmopolitan, and knows no boundaries, political or geographical. The city of Buenos Ayres, the writer observes, was founded in 1536, and is laid out in Roman fashion, as a city of squares and blocks, called locally *manzanas*, on a perfectly rectangular plan, and, though outside an area of about three miles each way, the axial lines of the streets are deflected so that they follow the bend of the river, the system of blocks of similar size, uniformly numbered, is as far as possible adhered to. The first houses were of one storey, and, shelter from the sun being an important consideration, the streets were kept narrow, some 32ft. between opposite frontages being about the maximum. With the growth of trade, it became necessary to increase the height of the buildings, which are now generally of three or four storeys in the centre of the town, and the tendency to increase the height grows with the increasing pressure of business and value of sites. Within the city, however, there are twenty squares and gardens, and the total space occupied by parks and public gardens is estimated at nearly six million square metres; the principal square, known as the Plaza de Mayo, adjoining the Government House and the Cathedral; and in this quarter are to be found tall and imposing hotels and business blocks; and not far from the harbour, steel-framed tall buildings on the American plan are springing up. The staple building material is red brick, for which there is abundant clay; but the brickwork is very skilfully covered—mostly by Italian workmen—with plaster, imitating freestone so cunningly that "it is often difficult to believe, even after due examination, that the apparent carved and moulded stone is only a sham." Stone is scarce, and frank brickwork is almost unknown; and "from the fact that in stucco and plaster the imitation of any given form and material is so easy, and from the cosmopolitan character of the population which has poured in and still pouring into the country, it results that no distinctive architectural style exists." But you get reminiscences of many styles—from the Pompeian house round its atrium to "the irregular, turreted, would-be picturesque style with high slate roofs and attic windows, such as exists in Grosvenor Gardens." Perhaps the finest building in the city is that which houses "the most magnificent and wealthy club in the world—the Jockey Club of Buenos Ayres." Although its stucco exterior is not noble, its interior shows a luxuriousness of decoration of which Pall Mall and St. James's know nothing. The Congress building is not yet finished. It is of Neo-Greek character, and its brick walls are to be faced with marble. Surrounding blocks of houses are being cleared away to give it an imposing plaza. The Teatro Colon is perhaps the largest opera house in the world; and, externally, "it is one of the most satisfactory theatre designs in existence." Its architect was a Belgian. A fine new station for the Central Argentine Railway is to be built by two English architects, Messrs. Chambers and Conder, in conjunction with an American, Mr. Thomas. Architecturally as well as in population, Buenos Ayres is perhaps the most cosmopolitan city in the world, and its description by an English architect is undoubtedly worth the space that the "Times" has given it. That this characteristic is not altogether pleasing to the writer is perhaps a sufficient reply to his delicate hint that London itself is in some danger of becoming, architecturally, too cosmopolitan. For our part, we have but little apprehension on that score; our chief fault has been hitherto the opposite extreme of dogged insularity. We have full faith that the prepotency of the national character will sufficiently safeguard us from the taint of mongrelism, however clearly we may see the advisability of a broader eclecticism.

A Lesson from Salford.

A short time back we had occasion to protest against several items in the "Form of Tender and General Conditions relating to the erection and completion of Annexe and Sundry Alterations and Additions to Existing Buildings" of Salford Town Hall. We are glad to know that, as a result of representations made by the federated builders of the district, whose cause we advocated no less cordially than tem-

perately, the most objectionable features of those conditions have been removed or modified. It is the result that might have been expected to accrue from the temperate presentation of a good case by an accredited representative body having among their resources a most effectual means of timely publicity. In all such cases, it is best to hold in check any natural feeling of indignation, and to try what can be done by studious moderation and courtesy, coupled with firmness. As an esteemed correspondent reminds us, "abuses creep in and become customary" because they are insufficiently considered by those whose interests are directly affected by them; and in such circumstances, anything in the nature of extravagant denunciation would not only do more harm than good, but would recoil on those whose past neglect of their plain duty towards themselves has been largely responsible for the encroachment. As, in effect, we remarked in the first instance, the Salford conditions were not unique; and as those who framed them were simply following—in the spirit, if not in the letter—a bad precedent that had been allowed to become common because of weak acquiescence in it, anything in the nature of bitter denunciation would have been beside the mark, and we are glad to know that the matter has been settled quite amicably and to the mutual satisfaction of both parties. That victory rests with the builders is not humiliating to the corporation, but is greatly to its credit; and our Salford friends are to be sincerely congratulated on having set so notable an example of the potency of "the reason firm, the temperate will," in matters which, in nine cases out of ten, justice can be secured by prompt action, courteous representation, and the well-nigh resistless forces of organisation and publicity.

One-room Flats.

The London County Council, it has been announced, "has gone a step further in municipal housing schemes, and decided to build one-room flats." The step appears to us to be retrograde. The flats, intended for workmen earning between 25s. and 20s. per week, will be rented at rates between 3s. 6d. and 10s. per week. Such accommodation may possibly be a boon to single persons who require cheap sleeping quarters; but we must confess to serious misgivings with respect to the statement that "young married couples are to be admitted on condition that they remove when their first-born reaches the age of three, or on the birth of a second child." The one-room system of family life is so repugnant that we are astonished to find the London County Council lending countenance to it. They will not, it is true, allow it to develop its most objectionable features; but we feel that they ought not to admit, and that they certainly should do nothing to encourage, a practice that is from almost every point of view so highly objectionable. Considering the many thousands of empty houses in the suburbs, the enormous acreage of building lands still available within easy reach of London, and the cheapness and convenience of transit in all directions, it seems to be quite unnecessary, as well as extremely undesirable and curiously inconsistent, to show even the slightest favour towards a practice against which, in its extreme forms, housing reformers have striven with passion and anguish. One-room family life is a blot on civilization, and that the London County Council should do anything whatever to perpetuate it is almost incredible. If public bodies *must* meddle in housing, we are at least entitled to look to them for a better example than that of providing accommodation for one-room families.

Obiter Dicta.

Great Britain Yet.

With a little faith in herself, England may very well prove herself in a better condition now than she was fifty years or a hundred years ago, not only absolutely, but in comparison with most of her rivals.—*Leading article in the "Morning Post."*

Renaissance, Intellectual and Spiritual.

We are still living in the Renaissance and the ideas of the Renaissance. It may be we are living too much in those ideas, are too immersed in them and bounded by them. The feeling that this is so, the feeling that the rational faculty in man has been too exclusively cultivated and developed, and that in consequence the spiritual faculty has suffered atrophy and decay, is penetrating men's minds to-day more and more. It is possible to overdo rationalism, we are beginning to think. Perceptions of another order than reason have been granted to man, and his nature has been so constituted that he cannot enjoy content and happiness unless these, too, are given scope. But yet, whatever development on that side may be in store for us, whatever spiritual Renaissance, dimly conjecturable now, as it seems to me, may await us in the future, it cannot be supposed that the value and significance of the great intellectual Renaissance will ever be seriously impaired. To say that reason is not all will never be to say that reason is not much. The power of the intellectual Renaissance is an abiding thing. It will always be with us, and will make, even in the spiritual sphere, its influence felt among us. And while this is so we must, if we allow to architectural representation its due weight, turn with sentiments of no common interest to those first struggles against heavy odds of the horizontal principle to re-affirm itself.—*Mr. L. March Phillipps, in the "Contemporary Review."*

Our Turn Next.

The year 1909 has been phenomenal for the building prosperity that has distinguished it throughout the United States. This enormous demand for architectural services and building materials will probably increase materially through 1910. It is a period that is distinctive in our architectural annals.—*"Western Architect" (Minneapolis).*

Mr. Ernest George on St. Paul's Bridge and St. Paul's Cathedral.

Mr. Ernest George has addressed the following letter to the "Times":—

SIR,—To those whose pride is in their city the scheme now before the Corporation is of the keenest interest; a new bridge and a new approach, opening up St. Paul's, provide the opportunity for beautifying a quarter of the town. Approached from the west the Metropolitan Cathedral forms an impressive picture, notwithstanding the iron railway bridge in the foreground. On other sides the great church is crowded upon by tall houses. There is now the chance of a south view by the proposed new street, which should have the dome in its vista.

It is the earnest hope, not only of architects and of other artists, but of all who desire beauty in our town life, that this great change shall be made, not only with a view to traffic, but at the same time with the wider consideration for all else that may be gained thereby. The new bridge should be a feature with architectural character, and should not be a clever arrangement of iron girders.

I trust that those in authority will admit, in consultation with them at the initiation of the scheme, the best talent to be obtained on its architectural or æsthetic bearing. The Bridge House Estates Committee graciously received a deputation of our Royal Institute which included Sir Lawrence Alma-Tadema and Sir George Frampton; the painters and sculptors also feeling that a great opportunity is with us.

If through your influence a wide public interest is taken in this matter the hands of the committee will be strengthened, and they will realise that a really noble scheme is expected of them. London has an unfortunate record of lost opportunities.—I am, sir, yours obediently, ERNEST GEORGE, President of the Royal Institute of Architects.

January 5.

Town Planning.

The National Housing and Town-Planning Council has decided to fix its headquarters in London. The Council has secured the co-operation of a very large number of local authorities, some 200 having agreed to assist in the development of the movement. It is now clear that a number of town plans will be submitted as the result of co-operation with landowners. That will be one of the greatest values of the new Town-Planning Act. The difficulty which many landowners have felt in developing their estates on right lines has been that they could not be sure how the adjoining landowners would take their proposals. It might, of course, easily happen that a small owner would completely block the proposals of a neighbour whose interests might greatly outweigh his own.—*"Manchester Guardian."*

A Plea for Artistic Decoration.

When one thinks of the many dull walls in London schools and mission-halls, and hospitals, and sees how refreshingly and suggestively they could be decorated, and at how small cost, one is half inclined to take hope for the revival of a craftsmanship that is something more than mechanical.—*"Times."*

Employers and Education.

Conferences between employers and education authorities are common in the North of England. In Newcastle they had held a conference at which every important firm on Tyneside were represented, and the advisory committee formed as a result were a real help.—*Mr. A. C. Coffin, secretary of the Newcastle-on-Tyne Education Committee.*

A "Towneries" Museum.

Unfortunately, the present movement of town-planning was too much broken up by specialists more eager to assert themselves than to co-operate with others, and important principles tended to be shouldered out. Civic exhibitions would guard against this. The speaker had in mind a great museum gallery which would be a kind of "Towneries." Here local collections could be sent, and again in turn might be borrowed. Such an exhibition would diffuse a wide interest and tend to increase inter-civic co-operation.—*Prof. Geddes.*

New Light on Spartan Art.

Dealing with the light thrown on early Spartan history by the recent excavations, Mr. M. S. Thompson has pointed out that the prevailing view that early Sparta was inartistic and uncultured as compared with other Greek communities must be largely modified in view of the examples of Laconian art of the 8th and 7th centuries B.C. now brought to light. Three periods of Spartan culture may be distinguished. In the earliest, extending from the Dorian invasion to about 800 B.C., the existence of foreign trade is indicated by the abundance of amber. During the next two centuries the finest specimens of Spartan art were produced, and numerous examples of carved ivories reveal intercourse with the East After 600 B.C. a period of decadence begins, and most of the extant accounts of Spartan history and life, all written from an Athenian or Ionian standpoint, relate to this epoch.—*Mr. M. S. Thompson, at the inaugural meeting of the British School of Archæology at Athens.*

THE RESTORATION OF SELBY ABBEY.

By Arthur R. Fairbairn.

The approaching re-opening of Selby Abbey draws attention to a work of restoration chiefly interesting because of its completeness. Not often is the public imagination so struck, as it was by the Selby disaster, that funds can be raised, sufficient not only to restore that which the fire destroyed, but also to put the building in a thorough state of repair from end to end. More than £40,000 has been spent, mostly in day work, owing to the nature of the repairs. As the roofs and ceilings of nave, choir, transept, and organ-chamber were burnt out completely, there has been reconstruction rather than restoration, in the case of the structural woodwork. The stonework repairs, however, were at first an unknown quantity, and only as the workmen "got down" to solid, uninjured walling, could the extent of the damage be known.

No new lessons were learnt after this fire as to the fire-resisting qualities, or lack of them, of such buildings. The flames from the blazing organ, confined for a while to the organ chamber, ignited the ceiling of the transept, even though that was at least 25ft. above the crown of the arch through which they passed. (A suggestion worthy of consideration has been made that where the organ is placed in a separate chamber, only a very light roof be built over it, so that in the event of fire it would rapidly burn out, without compelling the flames to pass into other parts of the church.) The stonework suffered severely, especially where the fire had been fiercest; being magnesian limestone it flaked and cracked to an appalling extent, so much so that in one case an arch could only be centred by being walled with brickwork on top of a timber centre, the mouldings having disappeared.

Three kinds of stone have been used in the Abbey, which are, however, geologically the same, quarried in different places on the band of magnesian limestone, which runs all along the Permian outcrop, forming the hilly country between Selby and Leeds. To a mason these stones are very different, the well-known Huddlestone being the hardest, so hard sometimes that it does not pay to work. This weathers usually beautifully clean and white. The equally famous Tadcaster stone, decidedly yellow, is far softer and easier to work, though greatly subject to shakes. The third, Monkfryston, has proved itself to be, though comparatively unknown and neglected, an excellent building stone. It is of a grey colour, very soft and somewhat "soapy" to work, sometimes spongy in texture; yet the Norman nave of the Abbey, entirely built of it, has weathered less than the other parts of the church. However, all three alike utterly failed to withstand the fire.

The stonework of the nave escaped largely because of the rapidity of the fire. The nave roof having two ceilings (an old one on top of the ceiling beams), the fire crept along inside from the tower unperceived, until when at last it broke out, the roof was alight practically from end to end. Evidence of the heat created was given by the melted lead in the top of the walls "grouting" the rubble filling, in some cases a yard down. Little else was required in the nave but the renewing of the Early English string, which formed the cornice, and the capitals in it to the wall-shafts. The new roof, like the old one, was constructed with king-post trusses, having massive oak cambered ceiling-beams as tie-beams, and an additional tie or collar across the heads of the struts.

The most difficult part of the restoration was the renewing of the stonework of the columns and arches in the choir arcade. Owing to the centering of the arches and the shoring of the columns, they were so surrounded with timber, that the workmen had very little room to work, and could use no tackle to place the stones in position. In addition to this, only the least possible portion of the calcined stone was cut away at once, for obvious reasons, and the openings always kept propped with short struts and wedges. The method adopted—the only possible one in most cases—was to insert the new stone in position laid dry on small strips of felt—old roofing felt was chiefly used—and then grout it with neat cement, chases having been cut in the back and bed of the stone so that the grout could run easily. This work of renewal proved to be more extensive than was anticipated. Much stonework, apparently sound, proved to be shattered when "rung" with a chisel.

The new choir roof is built on similar lines to the old one, though not identical in details. The old roof was of what may be termed "the groining type," i.e., without tie-beams, constructed of a series of trusses, having two members springing from the foot of one principal to intermediate points on the other. This was an unnecessary precaution, because the groining did not rise above the level of the wall-plate.

The present trusses are simply developed "collar-beams" formed out of 6in. by 6in. timber, with two members each springing from about a third of the distance up the principal to a point a similar distance from the top, they being halved at their crossing, and stiffened by a horizontal collar spanning the principals, made out of two 6in. by 2in. battens, bolted at their end to the principals, and at the centre to the intersection of the ties. These trusses are placed a foot apart and boarded upon direct, and they are also braced longitudinally. The framing of this roof is open to objection on account of the lower unbraced length of principal, but this objection has less weight than usual owing to the very steep pitch of the roof and the consequent approach to the vertical of the principal rafter. However, as the groining did not rise high enough to prevent it, tie-beams were fixed at intervals, and the wall-plate kept in from the inner face of the wall so as to allow of the fixing of short ashlaring, stiffening the unbraced length of principal. The oak groining, of the level-ridge type, with intermediate ribs, is fixed to the old stone springers, the centre bosses being bolted to the underside of the baulk tie-beams.

The most interesting feature of the whole restoration was the underpinning of the tower piers, and in considering this, one must remember the history of their foundations. Selby lies in that great alluvial plain, the vale of York, which in very few places is much above sea-level; in fact, the floor of the Abbey is less than 20ft. above normal high tide level in the Ouse a hundred feet away. Even now the water level is only about 6ft. from the surface, and of course it must have been considerably nearer when the building was commenced, owing to the undrained state of the country. It was evidently owing to that fact that the old foundations were found to be only a yard deep. Now so long as the land remained undrained, the building would have little

View of interior the morning after the fire: smoke and steam are still rising, and firemen still playing on debris. Remains of nave ceiling.

more than the normal settlement, or at any rate, only that amount which would result in a "balance" between the weight of the superstructure, and the hydrostatic pressure of the water-logged land at a slightly deeper level; a fine point for consideration, truly!

But, of course, as the surrounding district has been transformed from swamps into fine agricultural country by drainage, this has also drained the sandy strata under the tower foundations, with the result that it has slowly but continuously settled, and there occurred 200 years ago the collapse of the Norman tower. Evidently the building had been firmly founded on water—a paradoxical state of affairs, which was proved to be possible and actual a few years ago, when in the deepening of a stream in the town a bed of peaty sand was tapped and drained, with disastrous results to chimney-stacks and engine-beds. This state of affairs is also one which the lay mind finds difficult to apprehend rightly, as witness the remarks about the "dangling legs" of the tower, noticed in a previous issue of this journal, and also the serious statement that the tower stood upon a "vacuum."

At the commencement of the work of underpinning, concrete retaining walls were constructed in the ground around each pier, for a triple purpose—to retain the soil and avoid timbering the excavation, to form the foundations for the centreing of the tower arches, and to carry the ends of the girders, which as needles were put through the massive Norman tower piers. Fortunately below the running sand a solid bed of clay was found, at a depth of about 6ft., upon which the new concrete and blue-brick foundation was built, and finally the pier underpinned with masonry upon this.

Not only were the old foundations insufficient in depth and area, but the mortar used in them had perished and crumbled to a brown sand, with the exception of the south-west pier, which, with the two arches springing from it, was rebuilt in 1702 after the fall of the original tower.

When the tower fell, destroying the south transept and two bays of the choir—the north-west corner remained, as one side of Kirkstall Abbey tower stands now—and this was imitated as to the details of the Norman windows in it, but the upper stage was completed with a large circular-headed opening in each side, and crowned with a dentil cornice, baluster parapet, and imitation Gothic pinnacles. As, of course, the settlement still went on, and cracks appeared in the piers, this upper stage was taken down in 1902. In the fire of three years ago the Norman stonework which remained inside the north-west corner was completely shattered, but the bulk of the walling, being of brick, escaped uninjured.

SELBY ABBEY AFTER THE FIRE.

Top of the choir walls, looking east, the morning after the fire. Note the melted lead on the walls; this, with the lead found in the debris below, was melted out and recast. Top of the gable leaning outwards; this was subsequently taken down.

The building of the new upper stage of the tower was commenced late in 1908, after the completion of the underpinning and renewal of the damaged stonework. On each side of the N.W. stair turret there are remains of the original jambs and cills to the window openings of the old belfry stage—plain jambs simply chamfered and recessed, the inner order or breast having a hollow instead of a chamfer—apparently Early English. However, while these are still visible, they have been departed from, and the tower finished with a decorated upper stage. This has moulded jambs to the window openings, with ball-flower ornament, the inner order of the head being cusped. The cornice has carved patterns in its lower half, gargoyles at the angles, and in the centre of each there is carved an angel holding a shield. The upper stage—24ft. high from cill to cornice—batters 2½ins.; the massive pinnacles at each corner of the tower batter again more than this, as they are tilted diagonally slightly more than 7ins. in their height of 27ft. This has caused the appearance of some letters in the Press, pointing out that the "pinnacles ought to be taken down, because they have not been built plumb!"

Each pinnacle has four smaller pinnacles at the angles of its spire, is crocketed, and ornamented by a diaper pattern up the angles of its shaft.

To carry out the principle of "architectural refinement" still further, each gablet face falls back to the axis of the pinnacles 1in. in its height.

The quatrefoil pierced parapet has a pedestal in each side of the tower, upon which stand figures of King Edward VII., the ex-Archbishop Maclagan, Abbot Hugh (the most famous builder of the Abbey), and William I. These figures are placed 120ft. above ground, and are 6ft. 3ins. high.

The new work of the tower is built of Tadcaster stone up to the cornice; the cornice and all above is of Huddlestone. A peal of ten bells is now in position, and a clock and chimes—to play tunes at intervals—is being fixed.

The new roof, with gable and pinnacles to the north transept, is an addition, for its predecessor was a flat pitched roof, with low gable to suit, but apparently the original Norman transept had a steep pitched roof, though at a lower level.

The Lathom Chapel—used as an organ chamber—had to be taken down to cill level, with the exception of the corner buttress, the arch opening on to the north aisle of the choir from the organ-chamber, and also the arch of the neighbouring window with the two and a half bays of groining which they supported, had to be pulled down and rebuilt, as they were utterly burnt away and incapable of renewal *in situ*.

The north wall of the choir has settled out of perpendicular from 6 to 8ins. This, of course, has let down the vaulting, making its exact reproduction a matter of some difficulty, owing to the consequent alteration of the sweep of the ribs. This stone groining, level-ridged with diagonal ribs, is re-built in cement, with plastered brick spandrils.

The gable of the east end, with its large "attic" window, was so shattered that it had to be taken down and rebuilt; the four turrets were also thoroughly repaired to make good the ravages of time as well as of fire. To strengthen them, eight copper bolts were let through each angle at the base of the spire, and screwed up to a ring in the centre. In doing this work a boss was discovered, finely carved, at the top of the spire internally, in a position practically impossible to be seen. The pinnacles of clerestory to aisle on the north side of the choir were also restored, and the whole of the walling grouted. To do this all joints and beds were raked out as far as possible

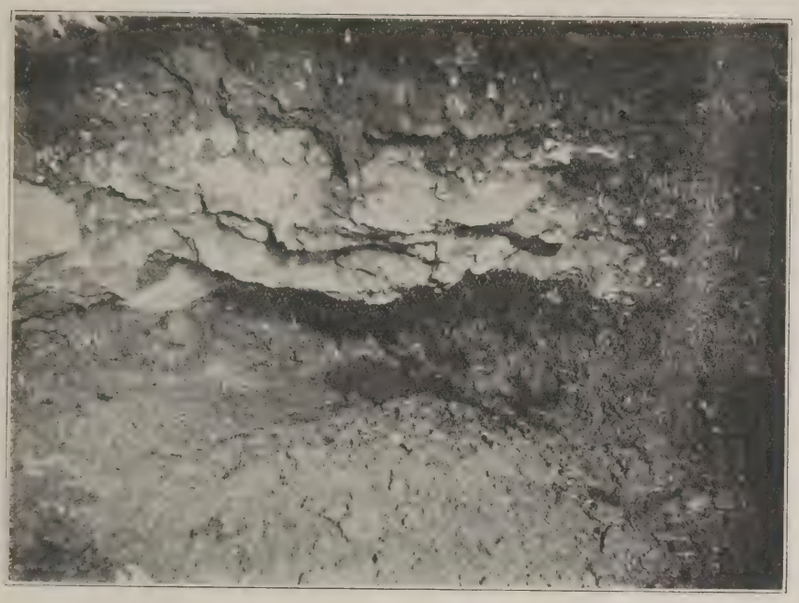

Photo: R. Swift.

SELBY ABBEY: EXCAVATION FOR UNDERPINNING.

This photo was taken immediately after opening out, showing *underside* of Norman foundation of south-west pier of tower only 3 feet down. Water accumulated in the hole from the loose sandy subsoil.

with a saw, and then pointed, leaving openings at suitable places at the top of joints. Round these a clay cup or "swallow nest" was made, and the grout poured in by tinfuls. There was no need for any grouting machine, generally speaking; the old wall was so hollow that the difficulty was, not to get the grout to run, but to get it to stop. A frequent source of trouble in this respect were the old putlog holes, which always went right through the wall or pinnacle, etc., having an opening on both faces about 6ins. square, fitted with a small piece of stone, but very often being a large cavity inside. In many cases the little filling piece had fallen out, making an excellent "desirable residence" for jackdaws, who had not been slow to take advantage of them.

While much has been said about the "loving care" and "ability" of the old builders, yet much restoration has been needed because the old builders were, after all, human, and could do "jerry work" like any 20th century contractor. An example of this is the east side of the north transept. The two tracery windows, like those on its west side, are poor copies of the somewhat Flamboyant tracery of the clerestory windows of the choir, but made to fit a less span with the same height, with a result that can be guessed. But, more than this, the whole construction is of the poorest, built of stones with little depth of bed and less bond. The respond to the transept arcade against the tower pier was merely a casing of the old Norman work, and the renewal of the arch above revealed remains of a painted Norman arch, which had evidently opened into the original apsidal end of the aisle. For some time it was undecided whether to take down the east side of the transept or not, but finally it was shored and renewed stone by stone.

The end of the transept, with its huge perpendicular window, was overhanging; so, as the foundations were defective, it was underpinned on the outside only, so that if more settlement occurs it will tend to revert to the perpendicular.

An interesting light on the methods of the old masons was thrown by the noticing of the perfectly preserved walling between aisle roof and groining. Here there is a fine collection of banker-marks, commonly called masons' marks. But not only that—on the cusped heads of the openings which lead on to the passage, in the wall, are to be seen the lines to which the stones were worked, not marked on as from a template, but run through with "tail-ends," as they only could be by being set out on each stone. This explains the often troublesome irregularity and variation of the stonework.

As can be understood, all the woodwork of the choir was destroyed. Only a screen to the north aisle of choir was left sufficiently intact to be restored. A replica of the aumbry cupboards has been placed in its position in the sacrarium, made out of the old oak, and is now one of the most pleasing features of the ornate chancel. The reredos, in general design similar to the old one, has carved panels by Peter Rendle, of Oberammergau--the Christus of the Passion Play—who personally superintended their fixing in position. The choir-stalls have now elaborate canopies instead of the plainer screen, with iron grilles which formerly existed. The organ, formerly confined to the Lathom Chapel, now is in three parts, one of which stands in each aisle, having a front that covers entirely an arch of the choir arcade. In addition to this, a chancel screen has been erected with a large rood cross upon it.

The flooring of the nave and transept is of wood blocks, the paving of the aisles squares of yellow limestone and blue York stone. The chancel is paved with black and white marble, executed by a Belgian firm.

While many of the windows suffered severely, the priceless Jesse window in the

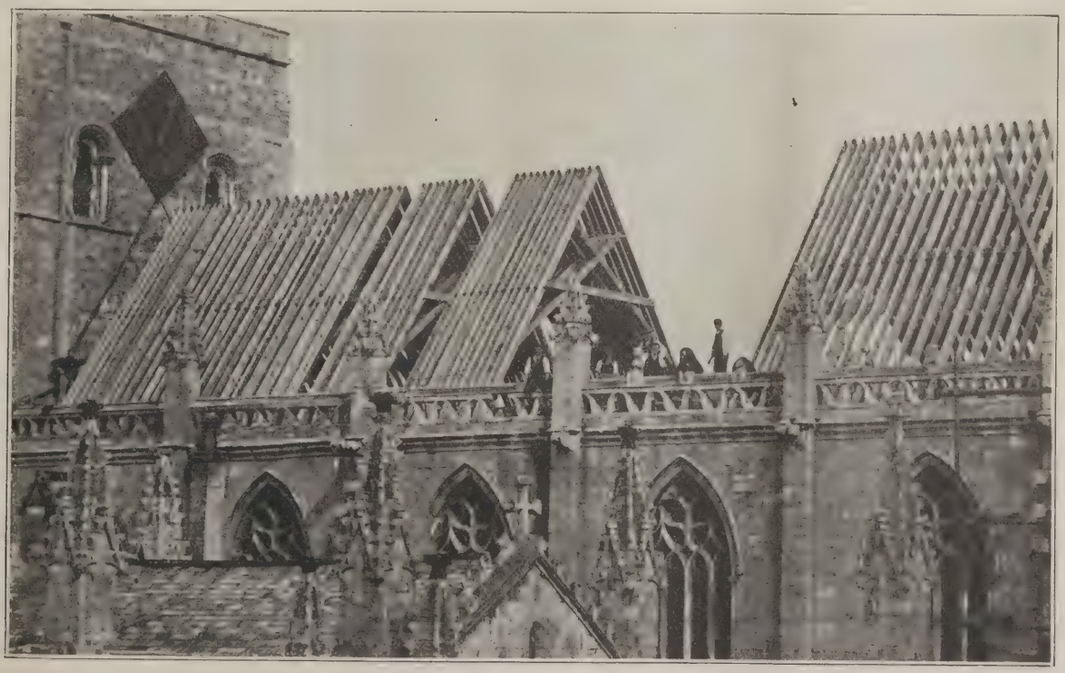

Photo: R. Swift.

SELBY ABBEY.

This view shows the new choir roof framing; also the old tower, minus the upper stage, with imitation Norman windows.

east end was not destroyed. With the exception of one or two small holes, the glass was intact, but the leading was damaged, and so the whole glazing was taken out and thoroughly restored before refixing.

The completion of the new tower shows in stronger contrast the bare ugliness of the wall that takes the place of the destroyed south transept, and it is to be fervently hoped that efforts now being made will be successful, so that the erection of the south transept being undertaken, the Abbey will soon stand in proportion and full beauty.

The architect for the restoration is Mr. J. Oldrid Scott, the contractor Mr. T. S. Ullathorne, who also carried out the previous restoration of 1890; the plumbing, including the casting on the spot of all lead for the roofing, was done by Mr. Braithwaite, of Leeds. Messrs. Thompson and Son, of Peterborough, have executed the choir-stalls and organ-screens, while the reredos, rood-screen, and pulpit are the work of Mr. Bridgman, of Lichfield. The clerk of the works is Mr. R. Searle.

Mr. A. C. Morton, M.P., has given notice of motion to the Corporation to consider the desirability of constructing a subway for pedestrians across Cannon Street by the Mansion House Station, and to confer with the Metropolitan Railway Company on the subject.

NEW ELECTRIC LAMPS AND THEIR APPLICATION.

About three years ago a change of some importance effected in the domain of electric lighting was brought about by the introduction of metal filament lamps. Not only has illumination by this means been rendered as inexpensive as with incandescent gas mantles, but the methods employed have altered to some extent, involving new ideas in regard to distribution of light and also of wiring. It is, therefore, not remarkable that many of those who are interested indirectly in these subjects have not been able to keep pace with the rapid progress that has been achieved, and have found some difficulty in adapting their previous knowledge of things electrical to the modern conditions. Not the least part of this difficulty is that presented by the large variety of metal lamps now on the market, combined with the many shapes and candle powers in which they are listed, and the different voltages that are found on the supply mains of the electricity undertakings. The carbon filament lamp need hardly be taken into consideration here; but although recent knowledge has shown that we were greatly deficient in our methods of using the light from this type of lamp to best advantage, at any rate everyone knew that lamps could be obtained for 8, 16, 32 and 50 candle-powers for all standard voltages, and therefore their employment was perfectly straightforward.

Centering to tower seen from the choir. The columns have been made good; the raking shores have been removed. Large shores are in position at weak spots. Upper scaffold carried clear of lower work.

Photo: R. Swift.

SELBY ABBEY.

Statue of William I., west side of new tower, showing part of new pinnacle, 120 ft. above ground.

When the new lamps were first introduced, however, they were only made for low voltages, i.e., up to about 125 volts, and for comparatively large units of light, the lowest (at 100 volts) being 25 candle-power. As a result, those consumers who wished to take advantage of the increased efficiency and consequent saving in current by their use, were generally obliged to have more light than they required. This was especially the case where the voltage was 200 volts and upwards, when it was necessary to burn the lamps in groups of two or more, in order to absorb the available volts; thus, where a consumer may previously have had one 16 candle-power carbon lamp, he had to employ two or more metal filament lamps aggregating 50 candle-power. Many people were put to the expense of having their fittings rewired for this purpose. About a year, however, high voltage metal filament lamps have put on sale, and although they are still relatively expensive and are, with one exception, still sold for fairly high candle-powers, the time is not far distant when the prices will come down with a rush, as well as the size of the units of light.

The chief difficulty under which the consumer now labours is in the choice of lamps to suit his particular purpose. Considering that there are on the market some three dozen metal filament lamps having different names, and that the consumer is constantly receiving advertising literature about them, in which each particular brand is claimed to be the best, it is obvious that he should feel at times perplexed.

In reality, the question is a very simple one, for there are only two different types of metal filament lamps, namely, "Tantalum" lamps and Tungsten lamps, although there are many varieties of the latter. "Tantalum" lamps have a filament of the rare metal tantalum; they are the only lamps in which the filament is a drawn wire and in which it is in one continuous length. Tungsten lamps are provided with a filament which is composed of the rare metal of the same name, but which at present seems too fragile to be drawn. The filaments are, therefore, made by mixing a precipitated powder of the metal with colloids into a paste, and squirting this through a small orifice into a hardening solution. Afterwards the organic compounds are burnt out, but it is evident that a filament formed in this manner cannot

be so strong, mechanically, as a drawn wire, and this is proved in practice. The best known Tungsten lamps are the Osram, B.T.H., Auriga, Metfil, Sunbeam, Lenconium, etc. These and others are made in Great Britain (as well as the "Tantalum" lamp), but many Tungsten lamps are imported from abroad.

The "Tantalum" lamp, although stronger than the Tungsten type, is not so efficient, but still takes only 50 per cent. of the current of a carbon lamp for equal candle-power. Tungsten lamps of all kinds have about the same efficiency, namely, 30 per cent. of the current of a carbon lamp for equal light for low voltage. But if the voltage is 200 and upwards, the efficiency of Tungsten lamps is less. As a matter of fact, it may be stated that "Tantalum" lamps consume, under equal conditions, about 40 per cent. more current at 100 volts, and about 20 per cent. more current at 200 volts, than Tungsten lamps. Against this may be set the fact that Tungsten lamps are from 10 to 20 per cent. more expensive than "Tantalum" lamps; that they are more fragile; that their longer life can only be attained by not handling them or subjecting them to vibration; and that the life of a "Tantalum" lamp can generally be renewed by tapping it when the current is on, when the broken ends of the filament become fused together again. So that it will be seen that there is something to be said for and against each type of lamp, but on the whole there is not much to distinguish between them.

As regards candle-powers and prices, Tungsten lamps for 100-130 volts can be had for 2s. 9d. and 3s. (depending on the candle-power, which varies from about 14 to 44), and "Tantalum" lamps for 2s. 6d. and 3s. At 200-260 volts the prices are 4s. 3d. and 3s. 6d. for the two lamps respectively. The smallest lamp for 100 volts is about 14 candle-power, and for 200 volts, 22 candle-power, but the Lenconium lamp is made for 8 and 16 candle-power respectively, although the latter costs, at present, 5s.

All the lamps are made in bell form in many sizes, and the "Tantalum" lamp can also be had in spherical form. Tungsten lamps give a slightly whiter light than "Tantalum" lamps, and their filaments are spread out more; this is the controlling factor in their shape.

All the foregoing remarks refer to lamps for 100 volts and upwards, that is to say, lamps that can be used direct on public electricity supplies. But under suitable conditions, lamps for smaller voltages and candle-powers can be used for electric lighting with very great advantage, down to as low as 25 volts and 8 candle-power. The points in favour of such lamps are twofold, namely, smaller units of light and therefore better distribution, and higher efficiency. The conditions under which these lamps may be employed are, firstly, with a private generating plant, and secondly, with a transformer on an alternating current public supply.

If the private generating plant is designed to give 25 or 50 volts, it is clear that not only can lamps for these pressures be used, with considerable saving in candle-power and current (up to 20 per cent.), but the plant will be smaller and, therefore, cheaper. In addition, the premises may then be wired on the concentric system, that is, by employing metal sheathed wires such as "Stannos," using the sheathing for the return current, and "earthing" one pole of the dynamo. This arrangement effects a large saving in the wiring. In the second case referred to, a house transformer is employed, having one winding which is placed across the supply mains, and the low voltage circuits for the house are tapped off various points of this winding. Such an apparatus, which is relatively inexpensive (30s. and upwards), is called an "auto-transformer," and enables any consumer on an alternating current public supply to benefit by the use of small candle-power lamps. If a "double-wound" transformer is employed instead, which entirely disconnects the house circuits from the mains, the consumer may also have his premises wired on the concentric system, and benefit by the saving in labour and material.

In conclusion, metal filament lamps adapt themselves particularly for use with Holophane glass reflectors, which can be had in many shapes, to disperse or concentrate the light, as required. By a judicious selection of the right patterns for each particular case, surprising results in illumination may be obtained, and in many cases as much as four times the lighting efficiency, so that where four lamps were used previously, one will now suffice. Hence, it will be found to pay in the long run to discard silk smoked glass, frosted and opal shades and other light obstruction or absorbers, in favour of metal filament lamps with Holophane glass, simplicity and economy.

LYCH GATE, ST. OSYTH, ESSEX.

A lych gate has recently been erected at St. Osyth, Essex, designed by Mr. Harold S. Rogers, of Dean's Yard, Westminster. The structure is entirely of English oak, standing on a base of knapped flint, with Doulting stone quoins and sills, and is covered with old plain tiles. In the spandrils of the principal arches and of the side openings are carved the emblems of SS. Osyth, Peter and Paul, and the Arms of Canterbury, and of the several sees to which St. Osyth has at different times belonged. With the exception of the ornamental iron hinges and latch—by Messrs. Whiteside and Caslake—the whole of the work has been executed in the village by Messrs. Norman and Gardiner

The memorial to the officers, warrant officers, non-commissioned officers, including members of the special service companies, who died in the South African War, presented by Sir Carne Rasch, was publicly unveiled at Chelmsford at the end of December by Major-General T. E. Stephenson, who formerly commanded the Essex Regiment. The memorial consists of three bases of unpolished granite, forming three steps, and upon these are the plinth, name-stone, cap, and obelisk, all of polished grey granite. The inscription sets out the object of the memorial, and that it was erected by Sir Carne Rasch from funds subscribed as a testimonial to him by his friends in Essex in recognition of his services as a former member of Parliament. A short dedicatory service was conducted by the Bishop of Colchester.

LYCH GATE, ST. OSYTH, ESSEX. HAROLD S. ROGERS, ARCHITECT.

The structure is entirely of English oak, standing on a base of knapped flint, with Doulting stone quoins and sills. The roof is covered with old plain tiles.

SMALL IRON CASTINGS.

By H. J. Ash, A.R.I.B.A.

The method of producing small iron castings may be conveniently divided into (1) Pattern making; (2) Re-melting of pig iron; (3) Moulding.

Pattern Making.

For small castings, which are required in considerable quantities, it is usual to make about a dozen patterns of the article to be produced. The best patterns are made of gunmetal or brass, inferior patterns being formed of white metal composed of 80 per cent. of spelter and 20 per cent. of tin. The patterns are made larger than the required casting to allow for the shrinkage, which takes place as the iron cools from a molten to a solid state. When accurate castings are required an allowance of 1-10in. per foot should be provided for this shrinkage. The finished patterns are connected by soldering to a runner or ridge as illustrated in Fig. 1.

The next operation is the making of what is known as an "oddside." The latter (Fig. 2) consists of a light iron frame about 16in. long, 12in. wide, and 1¼in. deep, into which plaster of Paris is poured in a liquid condition around the patterns. The plaster, when set, is coated with shellac varnish, and is then ready for the use of the moulder.

Re-melting of Pig-iron.

Pig iron as obtained from the blast furnace is re-melted in a cupola and used for casting. The composition of the pig iron is important, and for making fine intricate castings a pig should be selected containing a low proportion of sulphur and a rather high proportion of silicon.

The cupola, as illustrated in Fig. 3, has an outer shell of iron plates with an internal lining of firebrick. The firebrick lining is also protected by a lining of ganister, a sandstone used in a powdered state for this purpose. The cupola has a charging door A about 12ft. from the ground, a tapping hole B and tuyers C. The tuyers are connected by pipes D to a fan or blower for the purpose of forcing air through the cupola when charged with coke and iron. The cupola is lighted at the bottom, and then charged with coke above the tuyers, after which iron and coke are charged in succession. A small quantity of limestone is also added as a flux. After the fire has burnt above the level of the tuyers, a strong blast of air is forced through the cupola, and the blast is continued until the iron is reduced to a molten state.

When a sufficient quantity of molten metal has collected at the base of the cupola, it is "tapped," the molten metal which issues in a thin stream being received into a metal ladle. The ladles (Fig. 4) are lined with ganister and hold about 35lbs. of molten metal; they are provided with a long metal handle, called a "bewel." The ladle is carried by the moulder, who pours the molten metal into the sand moulds, which have previously been made and placed on the floor of the foundry.

Moulding.

This is carried out by the moulder first placing the "oddside" (Fig. 2) on a stump or bench. On the top of the oddside is then placed one-half of a moulding box or "snap flask" (Fig. 5), into which sand is next riddled over the patterns to an even depth of about ½in. The sand used is mixed with about 10 per cent. of coal dust, and is finely ground in a sand mill. The snap flask is then filled with sand which is shovelled into it and afterwards rammed by the moulder by means of two wooden rammers or "dollies" held one in either hand. The surplus sand above the level of the top of the snap flask is now scraped away, and a board about an inch thick is bedded evenly on the sand contained in the snap flask. This half of the mould, including the oddside and patterns, is now turned over, the oddside is removed, leaving the patterns in the sand mould which is then dusted with finely-powdered coke dust to prevent the adhesion of the second half of the sand mould which has still to be made.

The second half of the snap flask is now clamped to the first and is filled with sand as before. A hole is made through the sand to the runner as an inlet for the molten metal.

The two portions of the mould are now separated and replaced after removing the patterns. The snap flask, which is hinged at one corner, is removed from around the sand mould, leaving the latter on the board (Fig. 6), the whole being then placed on the floor of the foundry.

Before pouring the molten metal into the sand mould the latter is covered with an iron weight about 1¼in. thick to prevent the top side of the mould lifting while pouring.

It may be mentioned that 100 moulds can be made in one day by a moulder using one snap flask.

After the metal has cooled in the moulds, the latter are tossed over and the castings removed from the sand. The castings are then placed in a shaking barrel (Fig. 7), which is kept revolving by machinery for about an hour. By this means all sand is removed from the castings. Fine intricate castings which are too fragile for barrelling may be cleaned by forcing a stream of sand or "sand blast" over the castings.

THE JAPAN-BRITISH EXHIBITION.

At the Administration offices of the Japan-British Exhibition, the first gathering of the Public Health and Sanitation Committee, has been held under the presidency of Mr. H. D. Searles-Wood. The committee itself is formed as follows: Mr. H. Adams, Mr. T. W. Aldwinckle, Mr. H. P. Boulnois, Professor H. E. Kenwood, Colonel J. Lane Motter, Dr. Samuel Rideal, Mr. H. Saxon Snell, Mr. W. C. Tyndale, Mr. J. E. Wilcox, Mr. J. E. Wroth, of the London County Council, and (ex officio), Sir John Cockburn. A classification for the section was agreed to which embraces schools, prisons, barracks, camps, building material, dairy appliances, apparatus for water supply, heating apparatus, lighting and ventilation, clothing domestic appliances, means for the development of the physique, etc. In order to carry out the enormous amount of work which this represents, it was decided to appoint provincial sub-committees for Leeds, Birmingham, Newcastle, Glasgow, Edinburgh, Cardiff, Liverpool, Manchester, Bristol, Dublin, and all the great industrial and mercantile centres.

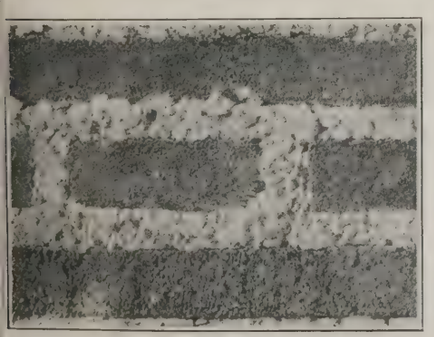
SUGGESTIONS IN BRICKWORK.

By A. B. Searle.

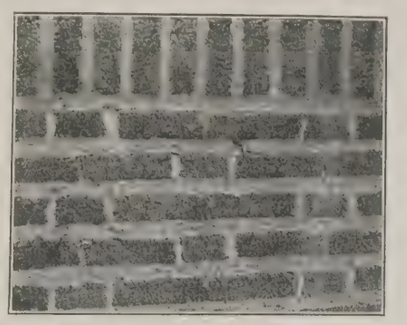
Until some twenty-five years ago bricks were commonly considered as convenient substitutes for stone where the cost of a building was to be kept down, but during the last quarter of a century, and particularly during the last ten years, architects and builders have realised that there are possibilities in building with bricks which were formerly undreamed of, even by the most progressive men.

It used to be thought that bricks should be of as even and regular a texture and colour as possible, but of late years it has been found that a less mechanical effect can be produced, and in some instances really artistic results can be obtained by means of somewhat rougher bricks laid with a wider jointing or in mortar of a different colour from that usually employed.

BRICK OF EVEN COLOUR AND NARROW JOINTS



DETAIL OF BRICKWORK SHOWING ROUGH BRICKS AND WIDE MORTAR JOINTS.



The accompanying illustrations show what is being accomplished by a progressive American firm of builders, who wish to impress on their customers the desirability of a greater variety, and the beautiful effects which may be obtained at comparatively little cost by the use of a little artistic taste.

Both in the States and in Great Britain architects are becoming keenly interested in getting away from the dull, monotony of ordinary brickwork, and the builder who can point to some of the designs shown in the accompanying photographs can often secure customers who would otherwise pass him. This is especially the case with residences in the provinces, particularly those of the smaller towns.

Nothing harmonises quite so well as a variegated brick set in an appropriate mortar for country residences; the surrounding green and the play of colour in the brick help to show each other off. On the other hand, few colours are more glaringly discordant than the beautiful green of the trees and grass and the ordinary dull and lifeless colour of monotonous bricks.

ATE FASHIONS SHOW RUGGEDNESS IN TEXTURE AND IRREGULARITY IN APPEARANCE.

BRICK OF VARYING SHADES, WITH WIDE JOINTS.

Modern bricks are no longer made in the same way as formerly, and the play of colours now obtainable, together with the more artistic texture of the surface, are such as to commend themselves in all places where stone is expensive or undesirable, and in many others where stone and brick are in competition.

A glance at the illustrations is sufficient to show the force of this argument, and in addition to the standard sizes further effects can be obtained by employing narrower bricks of the old "Roman" type.

A style of brickwork which is rapidly increasing in popularity in the States is made of vitrified bricks, or "pavers." These are remarkably dense and waterproof, and of a dark red or even bluish colour. The headers are often darker than the stretchers, but this is considered to increase the effect rather than diminish it. The blue bricks associated with Staffordshire are somewhat too harsh in appearance for this kind of work, but the redder varieties from that district are admirable, and may well be used in conjunction with a few bluer bricks.

TAPESTRY BRICK IN VARIABLE COLOURS LAID IN BLACK MORTAR.

The wide mortar joint requires considerable care, or it will offend by its coarseness rather than please by its rugged beauty. When properly used, however, it undoubtedly adds to the interest of buildings in which it is employed.

In spite of the general convenience of slates for roofing purposes, there can be no doubt that tiles are far more pleasing in appearance, and are generally preferable in country districts. They should be chosen to harmonise with the brickwork, and, like it, should have some variety of colouring, as a tiled roof, the whole of which is a bright brick red, is scarcely less ugly than the monotony of a slated roof. Fortunately, the roofing tile manufacturers appreciate this fact, and supply tiles which are admirable in every respect.

NATIONAL CO-OPERATIVE QUARRIES.

The creditors and shareholders of the National Co-operative Quarries, Ltd., of 59, Great Ormond Street, and Manchester, met on January 5th, at the London Bankruptcy Court to select a liquidator under the compulsory winding up order made recently on the petition of a creditor. Mr. H. M. Winearls, Official Receiver, reported that a statement of affairs had been lodged by Mr. John Hodge, M.P., the chairman of the company, showing the total liabilities £9,939, against assets £4,350, and as regarded shareholders a deficiency of £16,261. The liabilities included £5,368 due to loan stockholders. The society was registered in February, 1905, under the provisions of the Industrial Societies Act, 1893, with an authorised capital of £20,000, of which 9,674 was issued for cash and £994 as fully paid. It was formed by the New Co-operative Quarries Pioneer Society, Ltd., for the purpose of selecting a quarry in North Wales and establishing a working society to develop it on co-operative lines. According to the prospectus, the society was formed to acquire and work a slate quarry at Llanberis, to develop the property so that the workmen should receive a share of the profits earned, and to give permanent employment to as many of the locked-out Penrhyn quarrymen as the business engagements permitted. The purchase price of the lease, machinery, plant, and buildings was £5,000. In March, 1907, it was decided to open a depot of the society at Manchester, and arrangements were made to undertake contracts for slating in that district, though that involved the society in heavier expenditure, stock having to be bought and held. The directors hoped by means of those contracts to obtain for the society better prices and prompter payment for the slates, while avoiding the cost of advertising and the risk of bad debts. The trading of the society had been carried on at a loss throughout, any profit made by the Manchester depot having been insufficient to meet the loss incurred at the quarry, the management expenses of the London office, and interest charges. That result was stated by the directors to be due to insufficient capital, to depression in the building trade resulting in reduced prices, and to the unexpected expenditure on development at the quarry. In August last Mr. Stanley Pearson, of Manchester, was appointed receiver and manager on behalf of the stockholders, but an arrangement was made whereby the British Steel Smelters Mill and Tinplate Workers' Association (of which Mr. Hodge was secretary) entered into possession as mortgagees on August 6th. Assuming that the figures in the statement of affairs were realised, there would be very little for the loan stockholders and nothing whatever for the unsecured creditors or the shareholders.

Mr. Hodge said that his society had spent £745 in their efforts to preserve the interests of all concerned, and they still hoped that some arrangement would be made by which the business might be saved; otherwise the whole of the money expended on the development of the quarry would be sacrificed.

At the meeting of shareholders Dr. Campbell, Christ College, Cambridge, expressed great dissatisfaction with the manner in which the business of the society had been carried on.

Mr. Hodge justified the action of the directors, and asserted that throughout they had acted in the best interests of the society.

Resolutions were passed at both meetings for the liquidation to be left in the hands of the Official Receiver.

We are informed that the British Uralite Company have been successful in obtaining a large number of contracts for the supply of Uralite and Uralite Asbestone for the walls and roofs of roller skating rinks, etc. The company has recently placed on the market a solid plaster-asbestos partition.

D

Views and Reviews.

English Leadwork.

This is the first real treatise on a very beautiful and much neglected art, the possibilities of which, in our time, are only beginning to be realised. Mr. Weaver's volume cannot fail to stimulate its revival, and he has made his work one of the most complete and satisfying text-books that have come under our notice. Mr. Weaver wields a facile and captivating pen, and thus, apart from technical excellencies, presents his subject in a fresh and interesting manner. Indeed, the book is so exhaustive and so complete that we doubt whether it is open to anyone to write another, and "English Leadwork" should therefore take its place upon our shelves as *the* text-book on the art of the leadworker. For the perusal of the book or a mere glance at the illustrations will shatter the generally held conviction that the use of lead must be confined to the making of flashings or the formation of gutters. For those who hold a small opinion of the metal will be surprised to see to what uses the bygone leadworker has put it; and they will be more than a little astonished to learn that some works of art known to them are really of this despised metal, for Mr. Weaver has not spared the point of his penknife in discovering lead in unsuspected places. To what a pitch portraiture in lead may be carried is evidenced by Roubilliac's statue of Sir John Cass. The work is exquisitely clean, but without the suggestion of undue effort; nor is the sharpness of detail carried to an excess that would be subversive of the material. Lead garden figures are well known, but Mr. Weaver introduces many fresh examples to our notice. The book includes an interesting chapter on modern leadwork and a useful bibliography. A book to be heartily recommended.

English Leadwork: Its Art and History. By Lawrence Weaver, F.S.A., pp. xv., 268. Large quarto; 441 illustrations. Price 25s. net. London: B. T. Batsford, 94, High Holborn, W.C.

A YEAR'S BUILDING IN THE NORTH.

Yorkshire.

In Leeds things have been quiet all through last year. One or two firms have had fairly good contracts outside the city, but in Leeds itself big undertakings have been very scarce. One of the few contemplated large schemes is the teachers' training college and hostel in Beckett's Park, the plans for which, as we have already announced, have been adopted. The following table shows the falling off in the number of buildings of all descriptions, except detached and semi-detached villas, completed during the past twelve months:—

	Nov. 1908 to Nov. 1909.	Nov. 1907 to Nov. 1908
Villas	22	15
Semi-detached villas ...	69	54
Through houses ...	289	381
Back-to-back houses ...	321	413
Miscellaneous buildings	1,080	1,591
Sanitary conveniences	2,238	2,936

A similar discouraging report comes from Bradford, where, apart from the building of the new textile extension of the Technical College and the erection of new warehouse premises in Sunbridge Road, there is little activity except in the way of alterations here and there. Comparatively few dwelling-houses have been erected. With many mills working short time there is little prospect of further building operations in this direction, whilst the speeding up of machinery has diminished the need for larger works even with increased trade.

Huddersfield reports that trade has been quiet, but satisfactory compared with other towns. The only large work in course of erection has been a Baptist chapel and school. There has been a good deal of speculative house building, but it is falling off now. Such property has sold very well.

There has not been much activity in the Halifax district. The building of St. Hilda's new church at Kingston is the biggest contract that has been let, and the erection of the church was commenced two or three months ago. Additions to the Zoological Gardens have also provided work for builders. Some speculative building of dwelling-houses on the Greenroyd and Clapton estates has taken place, but there is no shortage of houses in the town.

At Harrogate the building trade, which is regarded as the staple industry, has been quiet. A few good villas have been put up, but there has not been much progress in smaller property. Speculators and builders have had little encouragement, for property has not sold well. The prospect of a large new hydro, and a couple of extensive school buildings and additions to the Corporation baths form a hopeful opening prospect for the new year.

The building trade in Hull is in a very unsatisfactory condition, and there is no prospect of immediate improvement. A vast number of unemployed are on the books of their unions. A large flour mill has been completed, and the only buildings of any note in progress are the Town Hall extension, which will occupy perhaps another two years; the City Hall and Art Gallery, which is approaching completion; and several Council Schools. There are few, if any, signs of extensive private enterprise.

The building trade in York has been dull during the year. No large buildings have been erected, with the exception of the Municipal Secondary School for Girls. The City Surveyor (Mr. Spurr) reports that during the year the plans approved for dwelling-houses numbered 101; plans for additions and alterations, 163; number of houses completed, 105; number of houses in progress at the present time, 88. In 1908 the figures were:—Plans approved for dwelling-houses, 118; houses completed, 84; and 104 in progress. The following are some of the principal works which have been completed during the past year, viz.:—The Nurses Home, County Hospital; skating rinks at Sycamore Terrace and Fishergate; pavilion and hall at Clifton Lawn; alterations at Adelphi Hotel; N.E. Railway Co.'s Garage, Leeman Road; additions to Messrs. Leetham and Son's flour mills, Hungate; additions to the Co-operative Society's premises; additions to Messrs. Hardy and Holgate's premises, Market Street; new stands, telegraph offices, refreshment rooms, entrance hall, saddling boxes, and lavatories, etc., at the Race Course, Knavesmire; new cocoa block, underground warehouse, box mill, etc., at Messrs. Rowntree's Works, Haxby Road; and alterations to the Exhibition Buildings. The following works will shortly be completed, viz.:—The New Secondary School for Girls at Sycamore Terrace, and the Wesleyan Chapel, Clifton. The following works are in hand or will shortly be commenced, viz.:—New Mission Hall, Swinegate; new tanks and additions to pumping plant for the N.E. Railway Company near Scarborough Bridge; new ferro-concrete stand to the 5s. enclosure, Knavesmire; garages for Messrs. Rowntree at the Works and in Wellington Row; new foundry for Mesrs. W. Dove and Sons in Piccadilly; new shops in Fossgate for Mr. Waudby. In addition to these the Corporation have in hand the construction of electric tramways and sheds; new street from Pavement to Piccadilly; widening of Acomb Road; strengthening of Lendal Bridge; private street works, etc.; and a scheme for the disposal of the whole of the York sewage on bacteriological lines.

Northallerton has developed to a large extent during the year. The building trade in the town has been very good, several large and important contracts having been carried out during the year, including the new Grammar School. To meet the requirements in connection with the staffing of these schools, several new houses have been erected. A long terrace of houses has been built opposite Arncliffe Terrace; and the building trade also received a fillip by the erection of additional elementary schools and the new police offices. The contract for the new sewerage works of the Urban Council is now in hand.

Newcastle.

Local builders declare that 1909 has been the worst year for business they have known for many years. The strikes in the shipbuilding and engineering industries in 1908, are considered to have had much to do with accentuating the depression, and now the coming general election is having a disturbing effect on prospective speculation. Trade generally has been so quiet, it is asserted, that tradesmen have been afraid to embark on undertakings of re-construction. One big firm of contractors, which in normal trade conditions employs about three hundred men, has less than one hundred employees at the present time. Other builders of note tell similar stories regarding the scarcity of work, although it is generally conceded that the prospect for the coming year is brighter than was the outlook at the end of 1908. Competition among the leading contractors is said to be keener than ever it has been, and for the smaller jobs there is an increasing number of competitors in the field. A large number of "small men" have sprung up in recent years, and the tendency is, it is stated, to cut prices in every direction.

The architectural features of Newcastle have been enriched during the year by several new blocks of business premises of handsome design and proportions. The attractiveness of Mosley Street has been supplemented by three new buildings of note, namely, those of the London City and Midland Bank, the Edinburgh Life Assurance Company, and the Alliance Insurance Company, the latter having just reached completion. Mosley Street, it may be remarked, is not one of the ancient streets of the town. It was begun in 1783, and was named after an alderman of that day. The street is advancing considerably as a business centre. Its past history is interesting from a dramatic and literary point of view. The old Theatre Royal was in Mosley Street. Bolbec Hall, in Westgate Road, has also been recently opened. It is the new quarters of the North East Coast Engineers and Shipbuilders and Shiprepairers' Associations, the business of which organisations was formerly carried on at Clarendon House, Clayton Street West. The North Eastern Railway Company intend to carry out extensions to their parcels department on land adjoining their present premises near Bolbec Hall. On the opposite side of the road large extensions and alterations are being executed at the Post Office. A good deal of old property has been demolished, and fine buildings erected on the site, and a storey has been added to the existing premises. Pilgrim Street will be improved by the imposing block of premises, now in course of construction for the Newcastle Conservative Club Company, and among trading developments it may be mentioned that Messrs. Bainbridge and Company intend to greatly enlarge their warehouse accommodation. Places of pleasure in the city and district have been augmented by the new skating rinks at the Old Grand Stand, Gosforth, and in Northumberland Road, where also is the White City. Adjoining the latter is the new Olympia, built by the Northern Cinematograph Company, to be used principally as a picture hall. New Market Street, connecting Pilgrim Street with New Bridge Street, is likely to develop into an important thoroughfare. On the south side of the street, near the New Bridge Street end, a large block of tenemented property was recently pulled down, and on the site Messrs. Tilley, restaurateurs, are having premises erected. The building will cover a quarter of an acre, and will have an equal frontage of 100 feet in Market Street, Carliol Street, and Croft Street. It will be faced with Kenton stone, supported

ARDKINGLAS, ARGYLLSHIRE
THE MORNING ROOM . . . .

on granite piers, and at the top there will be an open balustrade and flat roof. There will be five storeys. Shops will occupy the ground floor, and on the first floor there will be assembly, ball, and supper rooms. The upper rooms are to be used for storage purposes. Among the smaller jobs to be carried out in the ensuing year is the re-building of St. John's schools in Bath Lane, and the enlargement of Benwell Parish Hall; and there is also in contemplation the erection of a new hospital in connection with the Deaf and Dumb Institution, plans for which have already been passed by the Corporation.

Edinburgh.

All over Scotland for a number of years the building trade has been bad. Taking the number of houses to let all over the city, it is obvious the housing accommodation is a long way in excess of the demand, and there can be no remedy for this regrettable fact but expansion of labour. Given favourable conditions for the acquisition of sites, Edinburgh's geographical position, with the existing railway and seaport facilities, should promote its prosperity as an industrial centre. In the Portobello district there have been opened during the year large premises for a firm of horticulturists. In close proximity there are also in contemplation new premises for a wholesale manufacturing chemical firm. Plans for the first section of these premises have already been approved, and the whole scheme of buildings will be completed as the requirements of the firm demand. By the widening of bridges, erection of retaining walls, and the construction of new lines of railways, with the necessary increase of signalling boxes and storage sheds, the North British Railway Company have spent many thousands of pounds and given a large number of men employment. A large block of tenements at Seafield Road has also been erected, near the Marine Gardens. Skating rinks have sprung up all over the city, and the capital involved, as well as the labour and employment given, must represent a sum of considerable magnitude. In the centre of the city the most of the work has been confined to reconstruction and alteration of premises. New premises in George Street have been in operation during the most of the year, but some considerable time will elapse before the building is completed and ready for occupation as the organising centre of the United Free Church. Workmen have also been for some months engaged at the Art Galleries at the foot of the Mound, preparatory to a large scheme of reconstruction, which has been let to a city contractor for something like £20,000. There has been a large extension to the Law Courts in Parliament Square, the magnitude of which can only be seen from the Cowgate, where old buildings have been demolished to make room for the additions. Another interesting feature in this vicinity is the Chapel for the Knights of the Thistle, at present under erection. Another interesting building in course of erection is that of the Geographical Institute, situated at the corner of Duncan Street and South Gray Street. The feature of the front is the re-erection of the finely fluted columns, with richly carved capitals and moulded pediment, which formed the main entrance to Falcon House. Extensive alterations and reconstruction have taken place at the University. Many

HOUSE AT BRAY, BERKS, H. STANTON WEBBER, ARCHITECT.

The walls are faced with cherry red bricks, with stone dressings to windows on ground floor; above, half-timbered work has been employed, with similar bricks laid in herring-bone bond between the timbering. The roofs are covered with grey sand-faced tiles. All external timber has been treated with Solignum, and internally the joinery is of picked, stained deal. The ground-floor ceiling, in accordance with the wish of the client, has been kept fairly low, while on the bedroom floor the height of ceiling has been increased by several feet.

of the dark store rooms have been cleared out, and spacious classrooms constructed. To the new University there has also been an extension in the form of a new laboratory facing Middle Meadow Walk. The School of Art in Lauriston has been completed and opened during the year, and workshops are at present being constructed in conjunction therewith. An addition of very considerable magnitude is being completed, and a further extension contemplated, for the Church of the Sacred Heart in Lauriston Street, while adjoining their Presbytery in Falcon Avenue a new school is being erected for Roman Catholic children. For the clerical staff and show room the Edinburgh and Leith Gas Commissioners have made large additions to their premises in rear of Waterloo Place by the incorporation of tenement property. The extension to the General Post Office will soon take practical shape. The architectural features will be maintained, although the building will be considerably heightened. A new and thoroughly equipped police station at Torphichen Street has been built during the year—the ground floor for police purposes and dwelling-houses being arranged on the upper floors. In McLeod Street another police station is being erected. By the heightening and widening of the Caledonian Railway bridge at Tynecastle a great improvement has been effected. All over the city, but not to any special degree except in Warrender and Falcon districts, there have been dotted here and there tenements, villas, self-contained, and flatted villas. The latter seem still to be the more favoured class of buildings. New localities for flatted villas are Granton, Prestonfield, and South Lauder Road. For some time there have been houses of this class available in Piersfield district. All seem to find a ready market. In connection with the Cattle Market at Gorgie, the formation of roadways, bridges, Corn Exchange, auction marts, and slaughter-houses, a large number of skilled and unskilled men have been, and will be, employed for some time to come. The new barracks at Redford and the development at Rosyth should very considerably relieve the unemployed ranks in the city. The following are the Dean of Guild figures for the year, with a comparative statement for 1903:—From January 1st to the present date there have been passed through the Dean of Guild Court 681 warrants, 427 of these being for minor applications. In these warrants were comprised 11 villas, 142 self-contained and flatted villas, 95 public and other buildings, 531 alterations, 33 tenements of twelve shops and 241 houses. In the tenements were two houses of one apartment, 90 of two, 48 of three, 76 of four, 6 of five, and 19 of six apartments, the whole proceedings of the Court for the year representing an approximate value of £523,590. For the whole year of 1908 the warrants numbered 762, 461 being of a minor application. The warrants embraced 5 villas, 129 self-contained and flatted villas, 80 public and other buildings, 627 alterations, 33 tenements of 10 shops and 312 houses. In these tenements were one house of one apartment, 101 of two, 61 of three, 88 of four, 51 of five, and 10 of six apartments. The approximate value of the whole was £605,888.

Leith.

Mr. J. R. Findlay, burgh surveyor, Leith, in his annual report, states that depression in the building trade still continues, although the year just closing shows a slight improvement on the previous two years. The estimated value of buildings for which warrants were granted was £61,272, as compared with £56,200 in 1908, £58,674 in 1907, £179,000 in 1906, and £92,000 in 1905. The warrants include two new Doecker schools for the School Board at Balfour Place and Hermitage Park, and a new hall for the Salvation Army at Bangor Road. The tenements passed were for houses mostly of the two and three-roomed type, providing in all for 76 tenants. Of flatted villas there were altogether 21, in addition to 16 self-contained villas.

Elgin.

In Elgin there was a scarcity of money owing to the uncertainty produced by the Budget, and consequently building operations were somewhat slack. The chief event in the town was the opening up of the new street continuing Hay Street towards High Street through the Highfield grounds, which were purchased by the Town Council. Highfield House was at the same time renovated and modernised internally. The Town Council have fixed the feu-duties payable for the feus facing the new street at figures which are likely to ensure the erection of substantial buildings when the feus are taken up. Beyond this important addition little or no building was carried out during the year on the properties facing the principal streets. At the west end some new villas were completed for Mr. George Geddes, and a villa was also erected for Mr. W. Penny in Rose Avenue. Having purchased Murrayfield in the early part of the year, Dr. Stephen had the house almost completely gutted and extended. Dr. Stephen has also built a motor garage on the Moray Street end of his feu. At the upper part of the Deanshaugh ground on a few taken off by Mr. A. Macdonald, a modern villa has been erected to the order of that gentleman. It is anticipated that the extension of the water and gas supplies to this locality will be followed by the erection of other villas. The new Post Office in Commerce Street is one of the most complete and compact of its kind in the north of Scotland. The architect was Mr. John Wittet, Elgin.

Port-Glasgow.

Good progress continues to be made at Port-Glasgow with what is known as the Bay Area Building Scheme. At present the heart of Port-Glasgow consists mainly of narrow streets and old-fashioned buildings, but this new and ambitious scheme includes the sweeping away of the old to make room for the new. In other words, modernised tenements and wide streets are what is now aimed at. The first portion of what is really the biggest building scheme ever known in the neighbourhood is rapidly being pushed forward. This portion is intended to be fully completed by the month of May next, but the whole scheme will require about three years to finish. The housing conditions locally will be much improved, and one of the streets already shaping shows itself to be wide and airy. Altogether the scheme means that the central portion of the town will in course of time be thoroughly modernised and made bright and healthful. Messrs. P. MacBride and Co., Port-Glasgow, are the contractors.

Dunfermline.

While the building trade for the year has been far short of satisfactory, it shows a vast improvement on the previous year. Indeed, taking the municipal year—from September to September—the value of buildings erected in the city for the past year is more than double of what it was for the former year.

VESTIBULE, CHURCH OF ST. JOHN THE EVANGELIST, HERNE BAY.
T. W. WATKINS, ARCHITECT.

The vestibule is wholly of oak and was made in Belgium. It is the gift of the Children's Service.

During the year to September 21st there were 68 applications before the Court for warrant to erect buildings or alter existing structures. Of those 23 were for dwelling-houses, costing £23,400, and 25 applications were made to erect or add to buildings for business purposes, at a cost £10,144. One application was for the primary department of the High School, at a cost of £5,000, and another for an extension of the Technical School at a cost of £8,000. Eighteen of the applications were for small additions and improvements at a cost of £37,501. There is no doubt that a building boom would be begun in the burgh if feus could be obtained. But it is next to impossible to secure land on which to build within the burgh, as in nearly every direction the burgh is feued to the boundaries. Until an extension of the boundaries is obtained, therefore, there is likely to be a dearth of houses, especially for working-class tenants. The introduction of the tramways will, however, make speculators more ready to invest money in stone and lime. Such a scheme as that projected at Townhill would never have been thought of but for the fact of the tramways serving the district. Nor is it likely that there would have been so much building on the East Road, in which direction there is likely to be an enormous development in the course of a year or two, more especially if the boundaries of the burgh are extended in that direction, as they are likely to be. At the north-east end of the town, too, there is every possibility of all available land being secured for building purposes, and were the tramways in to the western extremity of the burgh, the available feuing ground there would soon be taken up. St. Leonards estate feuing and building are proceeding encouragingly on advantageous and convenient sites. To the south of the city Lord Elgin is ready to dispose of land for building purposes, and Mr. Henry Beveridge, of Pitreavie, is stated to have plans in progress for a space of ground being laid out on the garden city lines. Altogether, the building prospects for Dunfermline are bright for the next few years.

THE FARNESE PALACE.

It is not altogether surprising that the Italian Government should manifest some lack of enthusiasm at the proposal of France to purchase the Farnese Palace at Rome, which for the last five-and-thirty years has been occupied—by no means for the first time—as the French Embassy. France has long been thinking of buying a building, her associations with which go back on and off to the seventeenth century, and she has at last definitely decided upon the step to avoid having her rent raised by her landlords, the representatives of the Bourbon Kings of Naples, themselves the heirs of Elizabeth Farnese. Not Florence itself (says our Church contemporary, "The Guardian") contains a more noble or more sumptuous example of the Italian palace, and the possibility of its going the way of the Villa Medici and the Church of St. Luigi dei Francesi has produced a good deal of friendly murmuring in Italy which has hardly been quieted by a stipulation that the Government in Rome shall have a right of pre-emption at the price—£120,000—that is to be paid for it.

With the yellow Tiber and the Janiculan behind it, and the noble fountains from the Baths of Caracalla in front, the Farnese Palace stands in the very heart of Rome, a monument alike of its Renaissance extravagance and its antique splendours; for the huge blocks of travertine which give it the air of a fortress were quarried from the Coliseum and the Theatre of Marcellus by Cardinal Alexander Farnese, ere yet he had become Pope Paul III. Neither one lifetime nor one architect sufficed for so ambitious a work. Michelangelo was the greatest of the three designers who worked upon it, though it is to San Gallo that it owes its sombre distinction.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION
Jan. 15.	ELEMENTARY SCHOOL, KEIGHLEY.—The Education Committee invite competitive designs and estimates for a new Public Elementary School for older children to be erected at Highfield, Keighley. Printed instructions and conditions, with a lithographed plan of the site, may be obtained on application at the Education Offices. Designs and estimates to be sent by Jan. 15 to H. Midgley, Secretary, Education Offices, Keighley. Only architects residing or carrying on business within the Borough are invited to compete.
Jan. 31.	NATIONAL MUSEUM OF WALES. The Council desires to receive competitive designs for the erection of a new National Museum at Cardiff. Three premiums are offered of £200, £150, and £100, for second, third, and fourth. The Council have appointed Sir Aston Webb, R.A., Mr. John J. Burnet A.R.S.A., and Mr. Edwin T. Hall, F.R.I.B.A., as Assessors. Particulars and plans of the site will be supplied to competitors on payment of a fee of £2 2s., returnable if all papers are returned within 14 days. Inquiries to be addressed to Dr. Wm. Evans, Hoyle, Director of the Museums, City Hall, Cardiff.
Jan. 31.	PEMBROKE (Co. DUBLIN) LAYING OUT HERBERT PARK. The U.D. Council invite schemes with estimates of cost, for the laying out of above public park, which is about thirty-five statute acres in extent, within their district. A premium of £50, which is to include all expenses, will be paid to the person whose scheme may be selected. All plans, estimates, etc., sent in by the successful competitor to become the property of the Council. The Council will not be liable for any payment to a competitor, other than the above premium to the successful party. A plan of the lands as now existing can be obtained from on and after Monday, 3rd January, 1910. J. C. Manly, Clerk to the Council, Town Hall, Ballsbridge, Pembroke, Co Dublin.
Feb. 1.	OLDHAM, EXTENSION OF THE TOWN HALL. Restricted to Architects practising or residing in the Borough. Premiums of £50, £30 and £20, for the three designs placed 1st, 2nd and 3rd, and a sum of £5 will be paid to all unsuccessful competitors who send in a complete set of plans in accordance with the instructions. Plan of site, with instructions and suggestions for architects obtainable from E. C. Foote, Borough Surveyor, Town Hall, Oldham. Deposit: 21s.
Mar. 1.	GLAZED BRICKWORK DESIGNS AND ESSAYS. A committee of glazed brick manufacturers invite designs for works to be executed in glazed brickwork, also essays as to the advantages to be derived from the use of this material in accordance with conditions to be obtained from J. Johnston Green, 142, Liverpool Road South, Southport. Premiums of 100 guineas, 50 guineas and 25 guineas awarded to designs and essays jointly. Assessor Mr. Max Clarke, F.R.I.B.A., appointed by the President, R.I.B.A.
May 31.	MUNICIPAL OFFICES, KARACHI. The Municipality offer a premium of 7,500 rupees (£500) for the best design, detailed plans and estimates for new Municipal Offices. Cost not to exceed 500,000 rupees, and the style of architecture is left open to the designers. Ferrotype plans of the site and a general arrangement of the floors of the building showing the accommodation to be provided, together with a copy of instructions to architects, will be supplied to intending competitors on application to the Chief Officer and Chief Engineer, Karachi Municipality. A charge of Rs. 5 will be made therefor, which will not be refunded. Each set of drawings must be sent in anonymously, but accompanied by a sealed envelope containing the author's name and address. Each set of drawings and all the documents required, including the sealed envelope, must be securely packed in a wooden box addressed as follows:—The Chief Officer and Chief Engineer, Karachi Municipality, Karachi, India, and forwarded, at the competitor's own risk and charges, in time to reach the Chief Officer on or before the 31st day of May, 1910. It is proposed to apply to Government for permission for one of the chief architects to act as assessor to decide on the design to which the prize shall be awarded. The decision of the assessor will be final and not be open to dispute. The decision of the Municipality will be made within three months of the latest date for submission of designs, and payment of one-half of the premium will be made thereafter to the author of the selected design, the balance to be paid when the further details specified in the instructions to architects have been supplied. On payment of the premium the Municipality will have all rights in the design, with power to erect the building under its own agency, either according to the design selected or with such additions or alterations as it may deem necessary.

Peterborough.

The Soke Education Committee of the Northamptonshire County Council have decided to invite competitive plans for a secondary school for girls, to be built in Lincoln Road, Peterborough. The school will be a two-storey building, planned to accommodate 250 scholars, but allowing for enlargement, so that 300 scholars may be accommodated.

Workington Technical and Secondary School

The committee in charge of this competition have, after consultation with Mr. Wood, of the firm of Messrs. Oliver, Leeson and Wood, Newcastle, decided to recommend the Education Committee to accept the design submitted by Messrs. Clark and Moscrop, architects, Darlington, under the motto "Plan."

Plans were submitted by 42 competitors, and the first selection resulted in the five following plans being placed by the sub-committee in order of merit, as follows:—

1. Messrs. Clark and Moscrop, Darlington, "Plan."
2. Messrs. Cheers and Smith, Blackburn, "Zeus."
3. Mr. D. A. Beveridge, Liverpool, "Utility."
4. Mr. Henry Higginson, Carlisle, "Labor Vincit."
5. Messrs. Kelvey and Penlington, St. Annes-in-Sea, "Rex."

Our Plate.

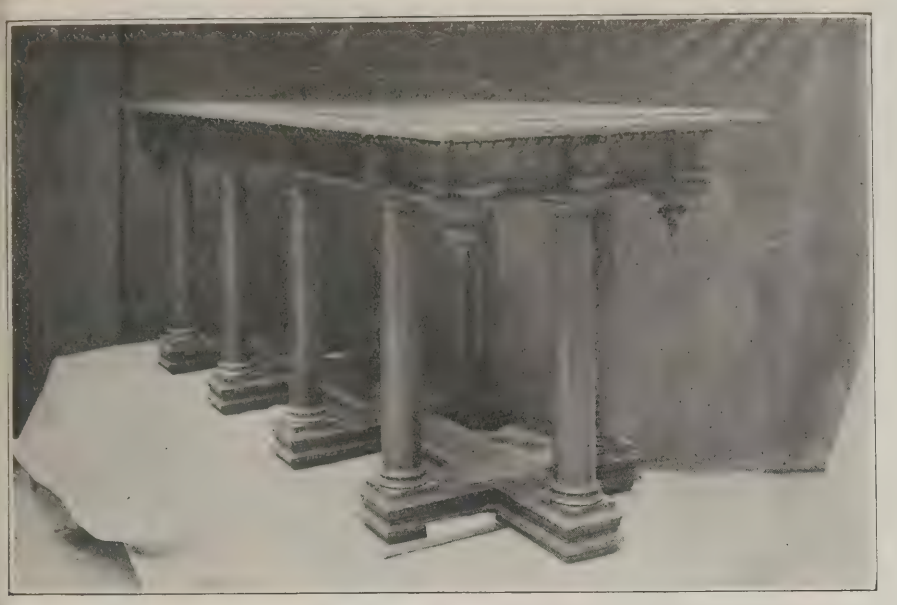
Choir Stalls, Screens, etc, St. John the Evangelist, Herne Bay.

The views on our centre plate and on other pages in the text illustrate a general scheme of enrichment of the above church with carved oak fittings, the cost being defrayed by various gifts and bequests. The church was designed by the late R. P. Day, A.R.I.B.A., the chancel being added later by Mr. W. James, and the oak fittings have been designed by Mr. T. W. Watkins, of 23, Old Queen Street, Westminster. The oakwork comprises the screen to the narthex (1907-8), choir stalls (1903), vestibule (1904), and memorial screen (1906), given by Miss Watkins in memory of her sister, and bearing the coat of arms of the Watkins family. The vestibule, given by the children's service, was made in Belgium; but all the other work was executed by the Bromsgrove Guild.

Societies' Reports.

Birmingham Architectural Association.

A lecture was recently given to the members of the above association by Mr. E. Treglown on "The Art of Lettering." The lecturer traced the formation of letters from the early days, when the simplest forms were used (the only examples of which remaining to us now are those carved in stone on ancient Greek and Roman buildings) through the florid ornamental forms of the middle ages, to the present time. By means of lantern slides, the lecturer pointed out the great effect that the shape and the spacing of letters had upon the buildings where they were used. He suggested that architects, knowing the increasing extent to which



LIBRARY

T. W. WATKINS, ARCHITECT.

ALTAR-TABLE. ST. JAMES'S CHURCH, DOVER. T. W. WATKINS, ARCHITECT.

The table is made of Canadian walnut, the edge is carved with vine leaf and grape, and escallop shell, denoting St. James the Apostle of Compostella. On the frame is the text "As often as ye eat this bread and drink this cup *ye do show the Lord's death till He come.*" The words in italics come along the front of the table, which was made by J. Daymond and Son, Westminster.

dvertising signs are being used, should ive more thought to the subject of letter- ng, and should so design their buildings hat the signs may form a pleasing finish o the front, instead of leaving this matter o the tenant and a signwriter, who, between hem, often evolved a glaring, vulgar, and btrusive monstrosity which quite spoiled he effect of the elevation, and in many in- tances covered some of the choicest bits f carving and other architectural details. At the conclusion of the lecture, a discus- ion took place, which was ably summarised y the president of the association, A. S. Dixon, Esq., M.A., F.R.I.B.A.

Proposed New Works.

ANNFIELD PLAIN.—The U.D. Council as passed plans for the following:—Mr. W. . Fawcett, five houses, William Street; Mr. . T. Castle, two houses on the Fines House Estate, Annfield Plain; Mr. T. E. Taylor, ix houses in Mitchell Street, for Mr. J. J. Bulmer; bath-room in connection with dwel- ing-house at Carrmyers, for Mr. Matthew Henderson; temporary warehouse on land ear Syke View, for Mr. Joe Bates; Mr. T. Mordue, coal and coke house at the Ann- field Plain Girls' School.

BELFAST.—The L.G. Board, Ireland, has signified its approval of the plans of the new abbatoir, and has sanctioned the loan ap- plied for.

BLACKPOOL.—The Corporation has passed plans for the following:—2 houses, Corder Grove, C. Morrison; 2 houses, Queen Victoria road, Thomas Walsh; 6 cot- tages, St. Anthony's Place, James Eaves; 2 houses and stables, Henry Street, J. G. Har- rison; house, Rosebery Avenue, J. J. G. Hall; 10 houses and shops, Whitegate Drive, and Reads Avenue, John Fish; 2 houses, Reads Avenue, T. Singleton; 2 houses, Woodland Grove, Fred Cock; shel- ter, Duke of Cambridge, Warbreck Road, Daniel Thwaites and Co., Ltd.; 2, wash-houses, Waterloo Road, R. Cardwell; and 6 shop fronts, Warbreck Road, M. Dickinson.

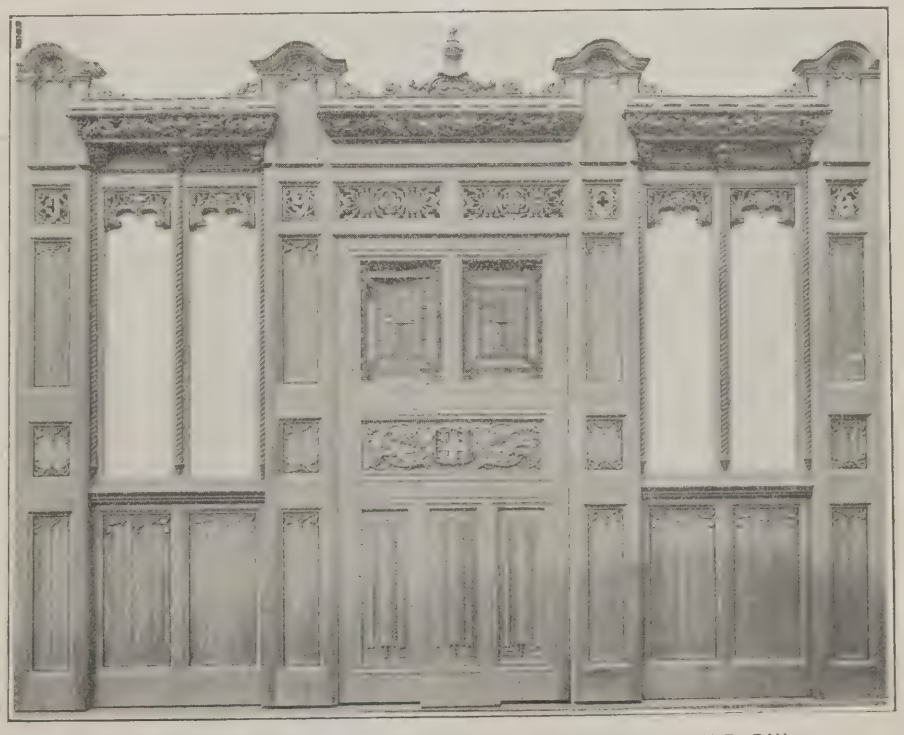
BROMLEY, KENT. — An anonymous donor has signified his intention to complete the erection of St. Luke's Church by provid- ing funds for the erection of a handsome spire with provision for and completion of a four-faced clock, chiming the quarter-hours and illuminated at night by electricity. Also a first-class peal of bells. to be rung by the parishioners of the church.

CHELMSFORD.—The L.G. Board has held an enquiry into the application of the R.D. Council to borrow £20 to build two cottages for workmen at the pumping station, Ingatestone. The inspector, Mr. F. H. Tul- loch, drew particular attention to the great gap between the lowest tender received, £395, and the next above—a difference of 20 per cent.

CLACTON-ON-SEA.—A L.G.B. enquiry has been held regarding the application of the U.D. Council for sanction to borrow £562 for private street works in Pier Gap and £800 for improving the West Cliffs.

CROYDON.—A. L.G. Board enquiry has been held at the offices of the Croydon R.D. Council, with the joint application of that Council and the Merton U.D. Council for a provisional order forming the two districts into a united one for the provision of a hos- pital for infectious diseases other than small pox. The present hospital has a site of 17 acres, the total cost being £30,077, of which £4,649 was paid for the site. An enquiry has been held in regard to the proposed ex- tension which provide accommodation of 12 more patients on the cubicle system, also quarters for the resident medical officer, and apartments for eight extra nurses, and cot- tages for the engineer and the gardener.

HALIFAX.—The Town Council intend to erect a new police station at King Cross, to cost £2,045. This will supplant seven ex- isting house-stations.



HENLEY.—The plans for a skating rink in Bell Street, submitted by Mr. F. Ellis, have been referred back by the Town Council, after recommendation by the General Pur- poses Committee, on the ground that the exits were insufficient, and that the public would be endangered in case of fire.

HORLEY.—The Hon. Secretary of the Horley Hospital Extension Committee writes to "The Surrey Leader," denying that the committee has accepted a tender for the work. The revised plans have yet to be considered and approved.

KILBARCHAN.—A committee of residents is being formed to collect funds to build a public hall here. Mr. A. W. Finlayson, of Mercheston, Johnstone, has started the fund with a gift of £500.

SOUTHEND-ON-SEA.—The L.G. Board has held an enquiry into the application of the Town Council to borrow £5,181 for pri- vate street works, and £310 to purchase land on the Westcliffs for public walks and plea- sure grounds. The streets proposed to be made up are Beedell Avenue, Grand Parade; Hainault Avenue; and Southview Drive.

STOKE.—The Board of Guardians is con- sidering the question of increased accommo- dation for its offices in view of the increase to 40 members in April next. The Building and Estates Committee having recommended that the architect prepare a sketch plan for a new Board-room, with accommodation for 60 members, offices, etc., the site to be the land adjoining the present offices. It was stated that the proposal was to submit the plan to the Local Government Board and endeavour to ascertain from them whether there was any likelihood of an amalgamation of the Wolstanton Union and the Stoke Union.

SCREEN, CHURCH OF ST. JOHN THE EVANGELIST, HERNE BAY. T. W. WATKINS, ARCHITECT.

This carved oak screen was erected in memory of Miss Watkins, and the coat arms of the Watkins family appears on the door.

TOWER ELECTRIC CRANE AT THE BRITISH MUSEUM EXTENSION WORKS: END VIEW.

TOWER CRANE AT THE BRITISH MUSEUM EXTENSION

The new type of crane in use at the above by Mr. W. E. Blake, the contractor for the extension, has rather novel features, viz., it has two jibs and, travels along the front of the building, and is made entirely of steel. The carriage is 21ft. by 19ft. 6ins., constructed of R.S. joist, angles, plates, etc., with six wheels. The track is 18ft. gauge, and has a 97-lb. rail, and is driven along by a 10-h.p. motor fixed on this carriage. The tower is built of angles, with flat bar bracings and stiffenings, gusset pieces, etc. The driving platform is 39ft. above ground, on which all the crabs and other gear for hoisting and slowing of jibs, etc. Each jib is controlled by a 20-h.p. motor, which work independently of each other. Both jibs are in use very often at one time. The jibs are capable of lifting eight tons to a height of 118ft. above track. The top of the tower is 98ft. 6ins. above track. The ballast is carried in the carriage.

Buildings in Progress and Completed.

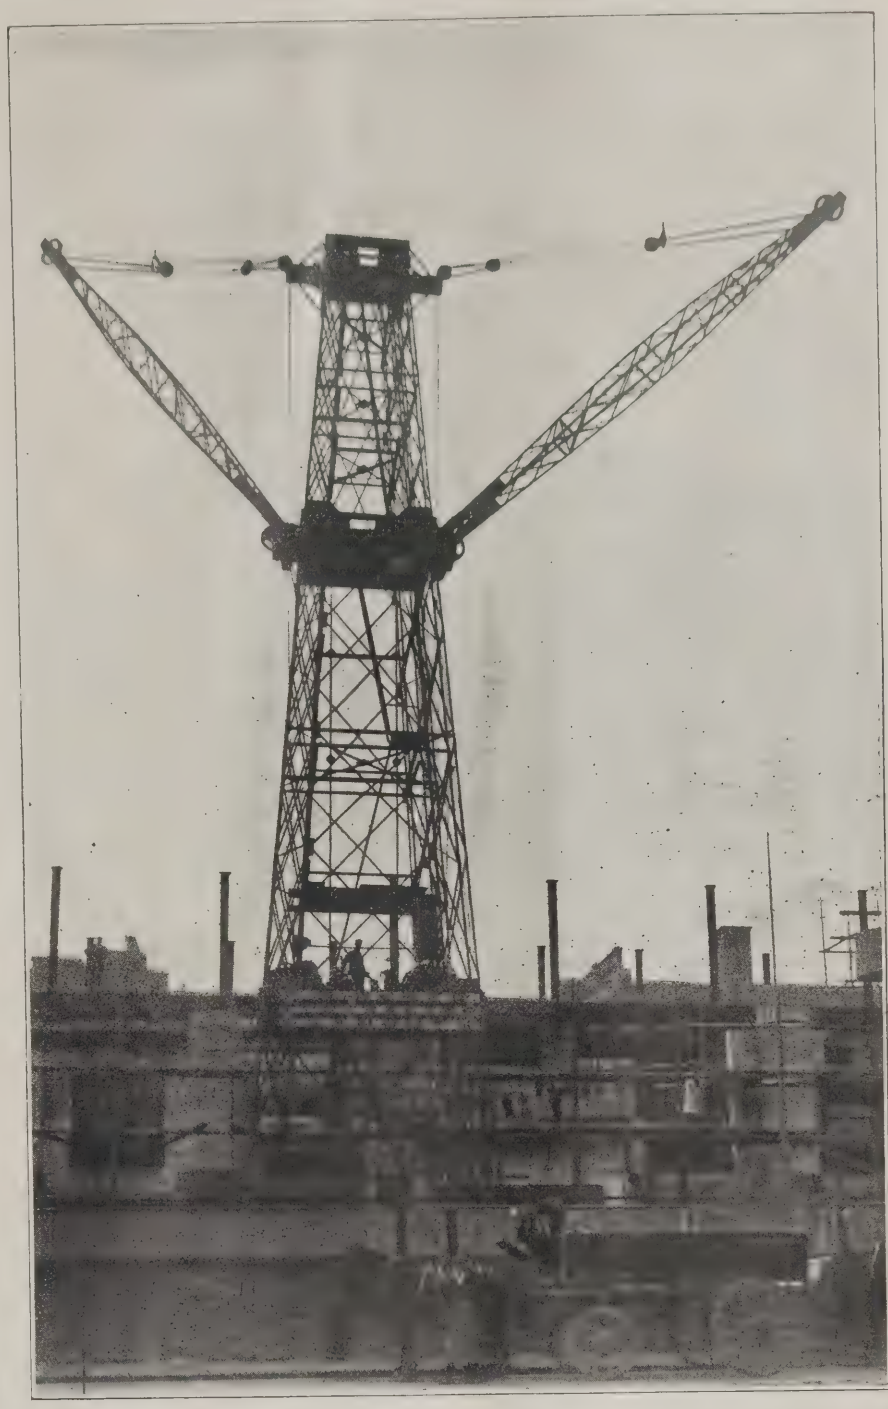
BERKHAMSTED. — The Berkhamsted school extensions are now under way, the tender of Messrs. J. Honour and Co., of Tring, having been accepted for the new buildings, which have been designed by Messrs. C. H. and W. A. Rew, of Berkhamsted. The new buildings will be erected fronting on Castle Street. From their situation, they will, in conjunction with the chapel and science rooms, on one side, and the swimming bath, armoury, and class-rooms on the other, complete the quadrangle. The gymnasium is being removed from its present position—which the junior school will occupy—and is being re-erected further down. Three new Eton fives courts are to be erected between the north end of the swimming bath and that popular institution, the "tuck shop." The architectural features of the new buildings will be similar to those of the chapel, lecture hall, and chemical laboratories higher up the street. The buildings comprise the large hall, 90ft. by 45ft., with a raised platform at the Castle Street end, and a gallery at the other; a two-storey junior school of eight rooms; and a continuation to the junior school of the covered cloister which runs alongside the chapel, etc. There will be accommodation in the hall considerably in excess of that provided in the Town Hall, as on the ground floor there will be accommodation for 600. with 100 in the gallery. It will thus be seen that for the purposes of Speech Day, school concerts, and for gatherings requiring accommodation for a large attendance, the hall is eminently suitable. With it, Berkhamsted School will be further qualified to rank with bigger and more extensive establishments of a similar nature. The hall will have a range of ten three-light windows on each side, and a large ten-light window with Gothic tracery similar to the chapel windows facing Castle Street. The roof will have steel principals, carrying a panelled and plaster ceiling. The junior school, which will be joined to the hall by the vestibule, will give the younger scholars much needed additional accommodation as well as setting free for the seniors the rooms they have so far used. On the ground floor will be four class-rooms, three of them 24ft. by 20ft., and one a little smaller, and with a passage running through from the vestibule to the western end, with a door opening on to the playground. On the upper floor, which, with the hall gallery and all the stairs, will be of reinforced concrete, will be three more class-rooms, and a large drawing-room, 34ft. by 30ft., with a large northern light. The junior school will be faced with brown bricks, with stone dressings, and the hall will be faced with red bricks, to match the adjoining buildings. The cost of the new buildings will be between £6,000 and £7,000.

FRASERBURGH.—The new tower of St. Peter's Episcopal Church, in 15th century style, has been erected at a cost of £1,500 from the designs of Mr. John Kinross, R.S.A., of Edinburgh.

GLASGOW.—The new German Evangelist Church in Renfrew Street has just been opened.

KENNETHMONT. — The new Rannes Public Hall has been formally opened. Mr. Archibald is the architect.

LEWES. The new hospital, erected at a cost exceeding £6,000, will be opened by Princess Henry of Battenburg on February 2.



LONDON.—Mr. E. C. P. Monson is the architect of the new Sutton model dwellings now in course of erection in the City Road. The dwellings are arranged in nine blocks to accommodate 300 families. A porcelain enamel iron bath, with hot water available, will be provided in every tenement—from the three-room tenement at 8s. a week down to the one-room tenement (with scullery) at half a crown a week, including water rate

and other rates. Each tenement is fitted with a patent range by which the living room fire heats the copper in the scullery and also heats the water for the bath. Every tenement has its food cupboard outside the room, on the balcony. It has a window and a door, so that there is complete cross-ventilation.

The London County Council has accepted the tender of Messrs. Walter Scott and Middleton. 28, Victoria Street, Westminster, S.W., at £78,860 7s. 1d. for the construction of the Woolwich subway.

MARSHFIELD.—The restoration of the Parish Church is now complete, and the building has been re-opened. The church has a finely proportioned and lofty nave, dating from the 12th century, and a square turret in a dilapidated state, used as a flue for heating purposes, because the steps, which used to lead to the rood loft, had been removed. The chancel was of earlier date than the nave, there being a circular Norman curtain arch to one of windows. The building has also a 13th century embattled tower in such a ruinous state that the peal of bells could not be rung. It has a fine south porch, with a late Gothic entrance with ornamentation evidently wrought by the same hands that made many of the beautiful English column caps at Llandaff Cathedral. Nothing of archæological or antiquarian interest was found during the restoration, with the exception of a 12th century tombstone in the belfry, used as a door jamb, and this has now been built into the south wall of the nave next to the south doorway. A handsome carved Austrian oak holy table has been provided and a brass lectern, the eagle of which is a copy of that taken out of the lake at Newstead Abbey. A three-light window has been placed in the south side of the nave recording the restoration, and a two-light stained glass window has been placed in the south side of the nave recording the restoration, and a two-light stained glass window has been placed in the north side by Sir George and Lady Forestier-Walker, in memory of their youngest son Godfrey. The cost of the restoration was £4,650. The contractor was Mr. Wm. Clark, Llandaff.

MARTLEY (Worcestershire).—The ancient church has been restored under the supervision of Sir Charles Nicholson, Bart., F.R.I.B.A. During the restoration there were found on the walls various colour-patterns, heraldic work, and pictorial cartoons. The architect first discovered the existence of the mural paintings in the chancel, and it was while investigating the north wall of the nave for traces of the Mortimer coat-of-arms, that the Rector, the Rev. J. F. Hastings, discovered another large painting. This led to their being uncovered and restored. The Rector and churchwardens, acting under the advice of Sir Charles Nicholson, engaged the services of a lady expert (Miss Leslie Moore) to deal with them. The paintings were covered by many a coat of colour-wash and plaster. Miss Moore points out that strictly speaking they are not frescoes. They are on a surface of lime-wash, which has been applied direct to the stone, and in many cases to the hardened mud of the walls. The whole of the north wall of the chancel and part of the south wall are covered with "masonry." The east window and the window in the south wall afford examples of 13th century work. Round the arch of the door into the vestry is a cinquefoil design. Opposite this door, on the south wall of the chancel, is the Annunciation. In the nave two paintings alone remain, both on the north wall. One is the Adoration of the Magi. Alongside this is a figure on horseback, and little doubt is felt that it is St. Martin, the Soldier Saint, especially as the grateful beggar can be seen with clasped hands in the background. In every case throughout the restoration the old designs have been strictly adhered to, and in many places the work stands exactly as it was before it was covered by grey plaster and blue-wash.

TOWER ELECTRIC CRANE AT THE BRITISH MUSEUM EXTENSION WORKS: SIDE VIEW.

ROMFORD.—The new administrative block, etc., at the Union has been formally opened. The building has been designed by Mr. H. Harrington, A.R.I.B.A., of 65, Bishopsgate Street Without, whose plans were selected in open competition. The following particulars were furnished by the architect:—The new buildings which have been added to the workhouse, comprise three distinct and separate blocks, viz., the receiving wards, which are erected to receive the new inmates on their admission, and in which they will pass a probationary period before being admitted to the various wards; a large block erected to accommodate the very aged and infirm men; and a block of administrative buildings, to accommodate the clerk and other officials of the Union; and also a board room and committee rooms for the use of the members of the Board of Guardians. The receiving wards are erected immediately inside the entrance gates, and comprise two separate buildings, one side being for females, with a porter's lodge attached, and the other side for males, with a large clothing store attached. Each building is one storey high, and measures about 60ft. by 23ft., and the accommodation in each includes a six-bed ward and a smaller isolation ward for two beds, also a day room and a bath-room. The rooms are heated by open fires, and they are lighted by air gas. Externally these buildings are of simple design, and are faced with stock bricks and have slated roofs, and they are kept low in elevation so as not to be obtrusive in front of the old buildings. The new block of buildings for aged and infirm men is erected to the west of the old buildings, and consists of a two-storey building about 200ft. long by 25ft. wide, and the accommodation includes two 20-bed wards, four 10-bed wards, four 4-bed wards, two large day rooms, also four bath-rooms, rooms for officers, and store rooms. The construction of this building is of very simple character, and it is erected with fire-resisting materials, and has floors of reinforced concrete. The floors of the rooms are paved with pitchpine blocks, and the walls are decorated with water-paint.

The rooms are heated by open ventilating fire grates, and in addition the large rooms are supplementarily warmed by hot-water pipes. The ventilation of the rooms has been carefully provided for on the natural system. Externally the building is designed in the simplest possible manner, and has a symmetrical and suitable appearance. It is faced with stock bricks, and the roof is slated. The new block of buildings to accommodate the Union officials and the Board of Guardians is erected to the west of the old buildings and fronting to Oldchurch Road. It is a two-storey building, with an "E" shaped plan, and measures about 87ft. by 72ft. over all. The accommodation comprises on the ground floor five offices for the use of the clerk and other officials, and a large strong room for storing books; also a Relief Committee room and a large waiting-room for applicants. The two latter are arranged in connection with a side entrance for applicants. The main entrance is in the centre of the front, and leads into a staircase hall. The stairs are of concrete. The first floor contains a Board room, 42ft. by 27ft.; three committee rooms, about 29ft. by 20ft.; a ladies' room and a cloak-room and store-rooms. The Board room provides accommodation for 40 members, who will be seated round two semicircular tables, and each member will have his own chair and drawer. The interior of this building has been fitted up in a simple and effective manner. All the rooms are paved with pitchpine blocks, and the hall and corridors with Venetian mosaic. The walls are plastered and decorated with water-paint. The construction of the building is of a fire-resisting character, with ferro-concrete floors. The building is heated by low-pressure hot water on the direct-indirect system, and ample ventilation is provided for by the natural system. Open fires are also provided for supplementary heating. The lighting of this building is also by air gas. The exterior of this building is designed in a simple symmetrical manner, faced with stock bricks, and has slated roofs, in harmony with the other surrounding buildings. The contractors are Messrs. J. S. Hammond and Son, of Romford, and the clerk of the works, Mr. A. Brereton.

SABDEN.—A new Baptist Church and Schools are being erected here. The Sunday School, which is to be first completed, will contain a central hall, 38ft. by 32ft., around which will be grouped eight class-rooms, each to accommodate from 15 to 30 scholars, and at the north end a primary room and additional class-room for specially dealing with the infant scholars. By means of folding-back partitions, the primary room can be added to the central hall, making it 56ft. by 32ft., for public meetings. The church is planned to seat 400 worshippers. The gallery floor is supported on cantilevers and stanchions of steel, and all the upright supports leave an unobstructed view of the preacher from every sitting. The baptistery is planned immediately in front of the pulpit, with retiring rooms for robing and disrobing, vestries for minister, deacons, and choir under the choir and organ gallery. Both buildings are faced with local rubble, tuck pointed, and Whalley stone dressings, and the total contract amounts to about £4,800. The architect is Mr. Fred. J. Parkinson, 9, Richmond Terrace, Blackburn.

WARRINGTON.—The Town Council has accepted the tender at £14,310 of Messrs. Alfred Thorne and Sons, Westminster, for an eight-foot bridge and approaches. The bridge will be of reinforced concrete.

WASHINGTON. (Co. Durham).—Messrs. John Clark and Son, builders, of Ryhope, near Sunderland, members of the Sunderland Association, have secured the contract for building here the Alexandra Theatre for the Alexandra Theatre Co., Ltd.

Coming Events.

Wednesday, January 12.

THE CARPENTERS' COMPANY LECTURES.—Professor Beresford Pite on "What is Artistic Craftmanship?" Carpenters' Hall, 7.30 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION.—Council meeting, 7. p.m. Ordinary meeting, 7.30 p.m. Two nominations for membership. Paper by Mr. Frank W. Rich postponed on account of the General Election.

THE NATIONAL FEDERATION OF BUILDING TRADE EMPLOYERS OF GREAT BRITAIN AND IRELAND.

MONTHLY REPORTS.

THE NATIONAL FEDERATION.

Meetings of Executive Council and Annual General Meeting.

The Council meetings on January 25th will take place at the Trocadero Restaurant, in the Balmoral Room, at 10.30 a.m. and 2.30 p.m. The General Meeting on the 26th will take place in the same room at 10.30 a.m.

In addition to the usual formal business, the

Agenda

includes the consideration of a recommendation that in future only the annual report be printed, the report to the half-yearly meeting to be a short interim report, read at the meeting, and reported in Journal only.

A recommendation in regard to the New Federation Supplement to the Journal is also made.

At the suggestion of a Country Federation, a discussion will take place on matters of considerable trade importance, such as labour exchanges, unemployment insurance, appointment of permanent medical referees, etc. This is the outcome of a desire to add greater interest to the proceedings of the General Meeting, and if found to effect this, the practice will no doubt be continued.

Amendments to the Conciliation Board Rules proposed by the operatives will be discussed, and the report of the Employers' Parliamentary Council will also be before the meeting.

The New Federation Supplement

will give special prominence to matters of interest to local associations. This object will be materially assisted if secretaries and members will promptly forward to the general secretary, or to the editors, information in regard to all matters of local interest. Part of the local interest is connected with advertisements appealing to local wants of our members. Secretaries are requested to study these, and try to enlist the help of advertisers to make the advertisements as representative of the wants of members as possible. Advice in regard to this will be willingly given by the general secretary to those who desire it.—A. G. WHITE, secretary.

Yorkshire Federation.

The annual general meeting of the Yorkshire Federation was held at the new offices of the Federation, West Bar Chambers, 38, Boar Lane, Leeds, on Thursday, December 16th, 1909. Mr. A. J. Forsdike (junior vice-president) occupied the chair at the commencement, and 44 delegates were present from affiliated associations. A letter was read from Mr. W. R. Thompson, of Dewsbury, regretting that illness prevented him from attending the meeting. The Federation heard with great regret of the serious illness of their president; and it was resolved to tender to him their sympathy, together with an expression of their relief at hearing of the satisfactory progress he is making towards recovery. It was resolved to send a vote of sympathy to Mr. W. Irwin, the president of the Leeds Association, who also was unfortunately absent on account of illness.

The annual report and balance-sheet of the Executive Council for the year ended November 30th, 1909, was presented and considered. The report and balance-sheet were adopted, and the printing of 1,500 copies was approved for circulation among the members, the final printing to be left over to January, until the new representatives are appointed.

The best thanks of the Federation were tendered to Mr. W. T. Ledgard for his painstaking and energetic services as hon. treasurer during the past year.

Alderman W. H. Jessop, J.P., having thanked the members for the many expressions of sympathy extended to him in his recent illness, said that it gave him much pleasure to submit the name of Councillor W. G. England, J.P., of Barnsley, as president of the Federation. Councillor England was a most capable man; had taken an active and deep interest in the work of the Federation; had been regular in attendance, and, he was certain, would justify his selection. The motion was seconded by Mr. T. Lindley, of Barnsley, and carried with acclamation. Alderman Jessop then invested Councillor England with the insignia of office, and tendered congratulations on his appointment.

Councillor England, in taking the chair, expressed his deep gratitude for the many kind remarks which had been made. He also acknowledged the presence of five past presidents of the Federation, which was a sign of the continued interest and active support which the Federation obtained from their leading members. He asked the members to cultivate a spirit of loyalty and of mutual confidence, and to give active support and regular attendance at the meetings both of the local associations and the Federation. He recognised the value and importance of an active and forward policy. They should go forward with all the power and might which they possess, being determined to exercise their power and assert their right with reasonableness and discretion, but above all things to seek higher attainment and wider recognition of the aims and objects of the Federation.

Mr. Broley, the president of the Barnsley Association, tendered to the president the congratulations of his members, and said that the association was also honoured by the appointment which had just been made. He was sure Councillor England would maintain with credit and distinction the high traditions of the office to which he was just appointed, and assured him of the loyal support of the members of his native town.

On the motion of the President, seconded by Mr. J. Dawson, it was unanimously resolved to tender to Mr. W. R. Thompson, the retiring president, the best thanks of the Federation for his unfailing courtesy, assiduous attention, and valuable services during the past year, and also to add his name to the list of ex-officio members of the council.

Mr. A. J. Forsdike, of Sheffield, was appointed senior vice-president, and Mr. J. Townsley, of Hull, junior vice-president; Mr. W. T. Ledgard, of Leeds, was re-appointed treasurer.

It was reported that no further nominations for appointment of committees and representatives had been received. It was thereupon resolved that the recommendations of the Executive Council be approved as follows: National Administrative Committee, president; Finance and Emergency Committee, president, two vice-presidents, treasurer, Councillor Mallinson, and Messrs. A. Moulson, W. R. Thompson, and W. E. Biscomb; National Federation and Northern Centre, president, and Messrs. A. J. Forsdike, W. T. Ledgard, W. R. Thompson, and A. W. Sinclair; National Conciliation Board, president, and Messrs. A. J. Forsdike, and A. W. Sinclair; Northern Centre Conciliation Board, president, and Messrs. A. J. Forsdike, W. R. Thompson, and R. Finch.

The treasurer reported receipt of £3 10s. from Selby Association, since the publication of the annual report.

It was reported that, at the request of the Lancashire, Cheshire, and North Wales Federation, the local associations had been asked to co-operate loyally in not tendering for the Salford Town Hall annexe extension, owing to the objectionable character of many of the first issued conditions; but a letter was read stating that, as the result of representations made from the Manchester Association, the committee of the Salford Corporation had now agreed to issue amended conditions, which it was believed would be acceptable to members.

Members were reminded that all who are subscribers to the "Builders' Journal," at the special Federation rates, would receive a copy of the Edition de Luxe in due course. It would not be necessary, therefore, for them to apply for copies.

The expediency of approaching candidates for Parliamentary honours on matters of trade interest and importance was considered, and the Finance and Emergency Committee were requested to give every assistance to any local association desirous of approaching candidates with a view to ascertaining their opinion on such matters.

The conditions of contract issued by the West Riding County Council were considered. It was resolved to request the West Riding solicitor and architect to meet a deputation to consider the conditions of contract now in use, and the president, vice-president, Aldermen Jessop, and Judge, and Mr. J. Biggin, with power to add to their number, were requested to represent the Federation.

Councillor W. G. England, J.P., stated that, at the request of Mr. Thompson, he had attended the meeting of the National Administrative Committee in London on December 14th, and gave a résumé of the business transacted.

The expediency of holding the annual dinner in January, in view of the general election, was considered. It was resolved that the annual dinner be held at Barnsley on Thursday, February 17th, and that a meeting of the Federation be not held in January.

Mr. Broley, on behalf of the Barnsley Association, invited the Federation to hold the February meeting in that town, and the invitation was cordially accepted.

The president and members of the Leeds Association afterwards entertained the delegates to tea, and a hearty vote of thanks was accorded to them for their generous hospitality.

Several members expressed their pleasure and delight at the central position and suitability of the offices, which had been jointly acquired for the work of the Federation, and expressed the hope that now that it had an official address its prestige would be enhanced and its influence increased.—J. J. DAVIDSON, Secretary.

In presenting their twelfth annual report for the year ended November 30th, 1909, the Executive Council express their pleasure at the growing interest which is being manifested in the monthly meetings of the Federation, and their satisfaction at the increased attendance of representatives from the affiliated associations.

The work of the Federation is steadily growing; its influence with architects and local authorities is being freely admitted; whilst its representations are not only received more readily, but find greater acceptance. The number of public welcomes extended to the Federation by local authorities is very gratifying, and affords opportunities for a few words being said on matters of public interest and trade importance.

During the year the Federation accepted invitations from local associations and held meetings in Wakefield, Leeds, Bradford.

Huddersfield, Dewsbury, Hull, Barnoldswick, Scarborough, Bridlington, Selby.

It is earnestly hoped that the building trade may soon participate in a larger volume of business at better prices.

So far as the Yorkshire Federation is concerned, the relations of the local associations with the operatives have been entirely friendly and harmonious. Only in one or two towns have matters been brought before the local Conciliation Board, and it is pleasing to note that a settlement was mutually effected.

The agreement between the National Federation, the National Association of Master Plasterers, and the National Association of Operative Plasterers is recorded.

The subject of municipal works departments is receiving the close attention of the Federation, whose assistance can be confidently relied upon in any town where an agitation is being worked up for an undue extension of municipal trading.

It is advisable that local authorities should not engage the unemployed to do works which have hitherto been let by contract. This procedure is likely to displace skilled workmen merely to afford relief of a very transient character for unskilled workmen. The consequences will be that the cost of the work will be largely increased, while the quality will be lowered. The risk of accidents will be considerably greater if workmen are employed who are not accustomed to either the plant or work.

The serious disadvantages which accrue from priced schedules being sent with tenders have again been discussed, and the Federation most earnestly appeal for the loyal support of every member in protesting against this practice. Where it is absolutely impossible to obtain this recognition, the priced schedules should be sent under protest and under seal, on the definite understanding that only the one of the successful contractor will be opened, and the others returned unopened.

One or two cases have been reported to the Federation of the final certificate being sent by the architect direct to the proprietor. This is contrary to the procedure laid down in the approved form of contract, and also to ordinary professional custom. Members are requested to bring the matter to the notice of architects who adopt this practice, with a view to inducing them to conform to the general custom.

With regard to conditions of contract, the chief lessons to be learnt from the experience of the year are: (a) to urge the use and adoption of the approved form of contract; (b) not to sign any contract which (1) requires the contractor to guarantee the accuracy of the quantities; (2) does not contain an independent arbitration clause. (c) Before commencing extensive extras to obtain an authoritative order in writing, or, in the alternative, to confirm any verbal variation in writing to the architect. (d) To request architects to supply blank copy of quantities to the contractor to whom the contract is let, in order that he may make a copy of his original quantities and deposit same when signing agreement.

The Federation has been in communication with the architect of the West Riding County Council, with respect to the terms and conditions of the contract form at present used, and will make further representations when the department is again placed on a permanent basis.

There have been one or two legal decisions of considerable importance to contractors during the year. In the case of Blackwell v. the Derby Corporation, the Court of Appeal held that an engineer engaged by a corporation should not act as sole arbitrator.

Considerable attention has been given by the Federation and local associations to the preparation of an equitable sub-contract form. The observations of the local associations were submitted to Mr. W. H. Hope, solicitor, of Sunderland, who has drafted a form of sub-contract which is at present receiving the consideration of the local associations. It is hoped to have this finally approved at an early date, when its use and adoption by members is earnestly recommended.

The absolute necessity of employers being affiliated with a strong and representative Federation is becoming year by year more abundantly manifest. The Federation again cordially recognise the valuable work of the Employers' Parliamentary Council, and the immense importance and benefit to the trade of the publication and distribution of the "Weekly Observations on Bill in Parliament."

The Federation strongly opposed clause 30 of the Housing and Town Planning Bill, which contained a most objectionable provision for registration of houses. This clause, which might have caused considerable inconvenience and annoyance to owners of property, was defeated. The Bill, after much consideration and considerable amendment, has now become law, and its provisions demand careful attention.

The Home Secretary has introduced this Bill in order to give effect to the report and recommendations of the Departmental Committee on Building Accidents. The Federation recognised the reasonableness of some of the provisions of the Bill, and were prepared to support it. This, however, was one of the Bills which had to be withdrawn by the Government owing to the exigencies of public business.

The representatives of the building trade and other industries had an interview with Mr. Winston Churchill, M.P., with respect to the Trade Boards Act, which provides for the establishment of Boards, with power to fix a minimum wage and official conditions of labour in certain specified trades. The deputation obtained a definite promise that the provisions would not be extended, without the sanction of Parliament, to industries which were sufficiently organised, and especially to those in which conciliation agreements had been made between employers and employees.

The National Federation has prepared draft clauses as to "fair wages," which should be brought before local authorities, when the matter is under consideration, in substitution for those usually submitted by the Labour Party or Trade Unionists. Local authorities often overlook the fact that, so far as the building trade is concerned, federated members are under an honourable obligation to pay the standard rate of wages and observe the recognised conditions of labour for private as well as for public work.

The Federation gratefully acknowledge the sympathetic and generous consideration of claims by Lloyds' Underwriters. In some cases compensation has had to be paid out of all proportion to the injury sustained; and this, with the growing charges for workmen's medical and legal expenses, has necessitated a slight increase in the premium. A sum of £54 16s. 1d. has accrued to the Federation as their proportion of commission received.

Several cases have occurred in which claims have been made against members by third parties. Special arrangements at reasonable rates have been made for insurance of members against this risk, which will probably grow in number and amount as the public are educated to the liability of owners and contractors for negligence resulting in injury to a third party.

Several cases have been brought before the Federation in which the interests of federated members were concerned, and the intervention of the Federation invoked. In the case of one such member, the Federation sought and obtained the consent of the National Federation to the member being protected and assisted in the event of proceedings being instituted. A case was prepared for counsel's opinion, but on account of the withdrawal of the claim against the member the necessity to proceed further was obviated.

The Federation again appeal to members to become subscribers to the "Builders' Journal," which is the official organ of the

ational Federation and its affiliated anches. Members will not only find arti- es of considerable interest, but will find e journal the only medium for circulation Federation news and proceedings.

The Council are pleased to report that a eeting of builders was recently held at Skip- n, when a resolution was unanimously opted to form a local association for Skip- n and district, and a strong and represen- tive committee was appointed to prepare aft rules for submission to a further meet- g.

At the invitation of the Federation, the ational Conference of Secretaries was held the Hotel Metropole, Leeds, on Tuesday, ctober 19th. Mr. E. J. Brown, president the National Federation, took the chair, nd gave an interesting address. Several apers of practical value were read, and the port of the proceedings will be found in e "Builders' Journal" of October 27th.

A conference of Yorkshire Secretaries was cently held when valuable exchange of pinions took place on several subjects and formation was given on many points of terest.

During the year a further issue of the ederation directory has been published. The les of the Federation are now being re- ised, and a further issue of the directory ill not take place until the rules can be corporated.

In view of the growing work of the Fed- ation and the necessity for careful custody nd classification of its documents, the Coun- il have recognised the necessity of joining ith the Leeds Master Builders' Association nd the secretary, in obtaining larger offices nd increased storage accommodation. It is oped that a permanent and official address ill increase the prestige of the Federation nd afford better facilities for meetings of ommittees and the conduct of its business.

The report is signed, on behalf of the xecutive Council, by Mr. W. R. Thompson, resident, and Mr. J. Davidson, secretary.

ARNSLEY ASSOCIATION.

Secretary: J. Denton.

The annual meeting of the Barnsley Fed- ration was held at the King's Head Hotel n Wednesday, December 8th, when Coun- illor G. Haigh, occupying the chair, was upported by eighteen members.

Councillor G. Haigh, the retiring presi- ent, vacated the chair after thanking the nembers generally for their support and ourtesy during his two years of office. The resident-elect (Mr. E. Broley) was then uly installed in his new official dignity midst acclamation. The new president, in is inaugural address, referred to the great ervices of the retiring president, Coun- illor Haigh, who had given without stint oth time and money in the execution of his est endeavour to promote the welfare of he Federation.

Councillor W. G. England, J.P. (the presi- ent-elect of the Yorkshire Federation) ffered his congratulations to the incoming resident, and proposed a vote of thanks to he retiring president. This was seconded y Mr. H. Ashworth, supported by Mr. T. indley, and carried enthusiastically.

The secretary (Mr. J. Denton) submitted is second annual report, in which he eferred to the good state of the building rade as regards the Barnsley district, in ontrast with the depression in most other arts of the country, and to the growth in he membership (a gain of six members on he previous year). He produced statistics referring to the increase and decline of the ercentages of attendances at the monthly neetings during the past four years, and asked the members to do their utmost to ac- ord the new president a full measure of support in this respect. The Yorkshire president, he said, had remarked, at the neeting of Yorkshire Secretaries, held in Wakefield, that the decline in attendances was due in some cases to the inability of he secretary to place before the members an instructive and interesting agenda. The Barnsley secretary, however, said he thought he might venture to claim that the members had invariably an interesting agenda placed before them.

The secretary's report was unanimously adopted, and a vote of thanks was accorded him.

The treasurer (Mr. H. Ashworth) submitted his sixth annual financial statement. The Federation was now financially in a record position, the funds in hand being greater than they had ever been before during his term of office as treasurer, and, he was glad that, after hard work, he had accomplished the self-set task of building up the finances to a record position. The auditors (Messrs. F. Goodyear and C. W. Squire) verified the treasurer's financial statement, and remarked upon the business-like way in which the books were kept. A vote of thanks was accorded the treasurer (Mr. Ashworth), and his balance sheet was unanimously adopted.

The Building Section of the committee was unanimously elected as follows:—Councillor G. H. Mellor, Councillor G. Haigh, and Messrs. S. Walker, P. Dalby, J. Higham and C. K. Taylor.

Messrs. Lee and Priestley, painters, were unanimously elected as members of the Federation.

Owing to the length of the agenda, the meeting was adjourned till December 15, when Mr. E. Broley, the president, occupying the chair, was supported by seventeen members.

The principal business, the new sub-contract agreement form as amended, received considerable attention. After the clauses had each been thoroughly discussed on its own basis, the sub-contract agreement as amended was approved in its entirety by the Barnsley Federation, and a copy of the resolution to that effect was to be forwarded to the Yorkshire secretary (Mr. J. Davidson) forthwith, the members present being of opinion that the various clauses were fair and equitable to both parties.

BRADFORD ASSOCIATION.

Secretary: J. Davidson.

The annual meeting of the Bradford Association was held at the Talbot Hotel on Tuesday, December 21st. Mr. T. E. Taylor, the retiring president, occupied the chair, and was well supported by members.

The president cursorily reviewed the work of the year, and called special attention to the exceptional loss caused by the death of several old and respected members. Mr. J. Moulson, treasurer, presented the cash statement, which was considered very satisfactory, and was adopted; and the best thanks of the association were tendered to Mr. Moulson for his painstaking and valuable services as treasurer, and to Messrs. C. W. Booth and T. Obank for auditing the accounts.

Mr. T. E. Taylor, in proposing the election of Mr. R. Raper as president, drew attention to his long and valued connection with the association, the high respect in which he was held in the city, and his recognised position in the trade. The motion was seconded by Mr. C. W. Booth, and carried unanimously.

Mr. Raper then took the chair, and, in returning thanks, called the attention of the members to the benefits which they derived from the local association and its complementary federations. The active members of the association had necessarily to carry out its work, while all members and non-federated employers were subject to the agreements which they made with the operatives. In the circumstances, he appealed to the members to take a greater and more active interest in the work of the association, and pointed out many instances in which assistance and information had been given which proved of great and material value.

A cordial vote of thanks was accorded to Mr. T. E. Taylor, the retiring president,

for his valuable services during the past year.

Mr. C. W. Booth (Messrs. M. Booth and Sons) was appointed senior vice-president, and Mr. J. Moulson (Messrs. J. Moulson and Sons, Ltd.), junior vice-president. Mr. J. Moulson was also re-elected treasurer. The usual trade committees and representatives on the Conciliation Board and to the Yorkshire and National Federations were also appointed.

Mr. Taylor reported the result of a recent interview with the Master Plasterers, and stated that many misunderstandings had been removed, and a more friendly spirit engendered. The secretary read correspondence and reported the result of a conference with the Bradford glass merchants. Mr. Taylor gave a report on the procedings of the recent annual meeting of the Yorkshire Federation.

Northern Counties Federation.

The annual general meeting of the Northern Counties Federation was held at the Palatine Hotel, Sunderland, on December 16th, 1909, Mr. J. Davison (Stockton-on-Tees), president, in the chair, when there were present 35 representatives.

Arising out of the minutes, the Tees-side secretary reported that his association were prepared to give the Stockton and Middlesbrough labourers ¼d. more per hour, making 6½d. per hour, the same as the Hartlepool labourers, and the association anticipated securing uniformity of working hours in all branches of the trade throughout the district.

The auditors' balance-sheet for the past year was submitted by Mr. J. C. Hope, which was seconded by Mr. P. Bray, and agreed to unanimously.

The secretary presented his annual report, which stated that the local associations had maintained and strengthened their position and increased their membership. A canvass of the members of the sub-trades and merchants had been most successful, a good many having joined. Many improvements in conditions of contracting had been effected. An agitation was proceeding for fair conditions of tendering, and steps had been taken by the Federation to approach the engineers and surveyors upon the matter. The report concluded by alluding to the proposed invitation of the National Federation to Newcastle in 1911.

On a recommendation from the Executive Council, "That the Board of Representatives be recommended to increase the secretary's salary by £30, and that a grant of £30 be made to him in addition to his salary for the current year," Mr. J. T. Armstrong spoke in very eulogistic terms of the services rendered to the Federation by the secretary, as did Mr. W. T. Weir, and Mr. R. J. Huntley, and the recommendation was carried unanimously. Mr. Hope returned thanks.

The estimated income and expenditure for the coming year was considered, and on the proposition of Mr. A. Ross, seconded by Mr. Brown, it was resolved: "That the subscription for 1910 from the local associations be at the rate of 1s. 6d. per cent. of wages paid during 1909, and that one-third of the subscriptions received from the honorary members be forwarded to the Federation."

A letter from the retiring president (Mr. J. Davison) in reference to the presidency for 1910 was read. The wish of the meeting was that Mr. Davison should allow his name to be put forward again, but this he refused to do, and moved that the senior vice-president, Mr. Alex. Ross, of South Shields, be elected as president, which was seconded by Mr. W. J. Ross, and agreed to unanimously.

Mr. Ross said he had great pleasure in accepting the honour, and moved that a vote of thanks be accorded to Mr. J. Davison for his services during his term of office. This was carried with acclamation.

Mr. J. Davison thanked the members, and Mr. Fred W. Ranken, of Sunderland, the junior vice-president, was unanimously elected senior vice-president. Mr. J. Proud, of West Hartlepool, was unanimously elected junior vice-president. Mr. J. W. White was unanimously re-elected honorary treasurer. Mr. J. C. Hope, of Newcastle-on-Tyne, and Mr. Percy Bray, of Middlesbrough, were re-elected honorary auditors. The following were re-elected upon the Executive Council: J. Davison (immediate past president), A. Ross (president), F. W. Ranken (vice-president), J. Proud (junior vice-president), S. Easten, W. T. Weir, W. Foster, W. J. Robertson, J. Pelton, J. Simpson, R. J. Huntley, W. B. Cooper, J. W. White, R. Johnson, W. Masters.

The following were re-elected upon the National Council; Stephen Easten, T. Wilkinson, J. Proud; J. W. White being a member ex-officio, and also upon the Northern Centre Council. The National and Northern Centre Conciliation Boards representatives, Messrs. T. Wilkinson and J. W. White, were re-elected. The president (Mr. A. Ross) and the secretary (Mr. W. H. Hope) were appointed as representatives of this Federation to attend the annual meeting of the National Federation to be held in London on January 26, 1910.

The secretary reported upon the proceedings at the annual meeting of secretaries held at Leeds on October 19th, 1909.

The South Shields secretary (Mr. J. G. Robertson) reported that he had attended before the Departmental Committee upon Railway Agreements, and given evidence upon railway facilities on the north-east coast. Mr. Robertson was thanked for his services.

It was decided to hold the next quarterly meeting at North Shields.

A report was received from the deputation appointed by the Executive Council in conjunction with a deputation from the Quarry Owners' Association to wait upon those quarry owners who were alleged to be violating their association's rules. The deputation had met with no success, the members in question refusing to fall in with the representations made to them that they should stand by the Quarry Owners' Association and reduce the wages they were paying in accordance with the notice given. The Quarry Owners' Association asked the Federation what further steps the Federation proposed to take, and it was decided that the matter be referred to the Executive Council, with full power to act as they deem advisable.

Mr. J. Morice Wright, the president of the Sunderland Association, invited the representatives present from the affiliated local associations to be the guests of the Sunderland Association at their annual dinner, and they subsequently dined together.—W. H. Hope, solicitor, secretary.

COVENTRY AND DISTRICT ASSOCIATION.

The annual meeting of the Coventry and District Association was held at the White Lion Hotel, on December 15th, 1909. The president, Mr. C. Garlick, occupied the chair.

After the usual routine business, the election of officers took place, the whole of the officers being unanimously re-elected for the year 1910.

The Secretary reported that he had received a deputation from the L. and N.W. and Midland Railway Company, as to the question of demurrage; the railway company are now desirous of clearing up these demurrage accounts, which were incurred for the most part between 1906 and 1908, and offered to forgo all claims previous to June, 1907. A long discussion took place on the matter, and several members mentioned cases of inconvenience and loss through the inability of their carters to get at wagons after being duly advised, and the secretary was instructed to send a letter to that effect to the L. and N.W. Railway and Midland Railway.

The business portion of the proceedings was followed by a smoking concert.

No Need Now to Lament Lack of Opportunity

Though you had to start work young, in a humble position, you can rise high, thanks to the efficient technical training offered you, by correspondence, by the International Correspondence Schools. You need not envy the college trained man, for, after all, the ideal time to master the science of a trade or profession is while you are getting practical experience. Here is interesting testimony from Mr. C. R. S. Frost, of Wolverhampton:

"Your Courses were brought to my notice by my Employer, a prominent South African Engineer. Upon his advice I took up your Civil Engineering Course. He was a student in the same Course himself. Fifteen months after, he sat for his A.M.I.C.E. examination and was successful. I have met several men who, I am certain, would be grinding away still were it not that they had been lifted out of the ordinary groove by an I.C.S. Course. I honestly advise everyone who has not been able to obtain that training, which our more fortunate brothers may have had, to join your Schools at once. If any student sticks to his studies under you, he will find himself quite as well equipped, if not better so, than many college trained men."

Send us a postcard, mentioning your line of work, and we will forward you details of the appropriate I.C.S. Course, together with a list of the Faculty Officers and Experts, whose brains and experience we place at your disposal. Write NOW.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about **five days** after the date of this issue.
Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders.
The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the Contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Jan. 1-17. **WEST HAM.**—Extension of the existing West Silvertown schools, and erection of the boys' new department, for the Corporation. Contractors are requested to make written application to William Jacques, A.R.I.B.A., Architect to the Education Committee, 2, Fen Court, Fenchurch Street, E.C., for copy of quantities, conditions, and form of tender, not later than Jan. 1. Each application must be accompanied by a deposit of a £5 Bank of England note. Plans and particulars may be seen at the Architect's Office. Tenders at the Education Department, 95, The Grove, Stratford, E. Fair wages clause.

Jan. 1-21. **EXMOUTH.**—Alterations and additions to the Exeter Road Council Schools, Exmouth (boys' and girls' departments), for the Devon County Education Authority. Bills of quantities for the work will be available in due course on deposit of £1 1s. Contractors desiring to tender must apply to the County Architect (Education), 1, Richmond Road, Exeter, not later than the first post on Jan. 1, enclosing a crossed cheque drawn in favour of the County Treasurer. Quantities will be issued about Jan. 8, and sealed tenders must be delivered at the Architect's Office not later than Jan. 21.

Jan. 3-17. **LONDON, S.W.**—Execution of the following, for the Secretary of State for War:—Reappropriation of A.S.C. block and erection of additions to provide accommodation for the Royal Army Medical Corps, Millbank, London, S.W. Plans, specification, and conditions of contract may be inspected at the office of the Director of Barrack Construction, 80, Pall Mall, London, S.W., on Jan. 3, 4, and 5, to whom application must be made by Jan. 7., accompanied by deposit of 10s. Cheques or orders to be made payable to the Assistant Financial Secretary, and crossed "Bank of England for credit to Army Funds." Tenders to be sent to H. De La Bere, Director of Army Contracts, War Office, Whitehall, London, S.W.

Jan. 13. **LEEDS.**—Contractors desiring to estimate for the various works (except brick and mason) required in the erection of three pairs of semi-detached houses, Beeston Hill, Leeds, for W. Preston, are requested to send their names by above date to W. S. Braithwaite, Architect, 6, South Parade, Leeds.

Jan. 13-25. **CHATHAM.**—Erection of balconies at the Workhouse Infirmary, Chatham, for the Guardians of Medway Union. Applications for bills of quantities, accompanied by deposit of £1 1s., to be made to the architect, E. J. Hammond, Balmoral Road, Gillingham, by the 13th inst. Tenders to be delivered by post at the Guardians' Offices, Medway Workhouse, Chatham.

Jan. 15. **NORTHWICH.**—Erection of a new school to accommodate 350 children, at Northwich. Plans and specifications can be seen at the Education Office, Verdin Technical School, Northwich, and quantities obtained on deposit of £1 1s. Tenders to be delivered to A. E. Thomas, Education Office, Northwich. Fair wages clause.

Jan. 17. **TALKIN (near Carlisle).**—Repairs to school and house, for the Managers of Talkin school. Plans and specifications to be seen with R. Routledge, Talkin. Tenders to be sent to Rev. W. Powell, Hayton Vicarage, How Mill.

Jan. 17. **HALIFAX.**—Various works required in erection of workshop at Highroad Well. Plans may be seen and bills of quantities obtained of Jackson and Fox, Architects, Rawson Street, Halifax, to whom tenders are to be sent.

Jan. 17. **PONTYPRIDD.**—Erection of a cottage hospital at Pontypridd for the Executive Committee. Plans and specification can be seen, and bills of quantities obtained on deposit of £2 2s. with A. O. Evans, Williams, and Evans, Architects, Pontypridd, to whom tenders are to be sent.

Jan. 17. **FARTOWN.**—Contractors and others desirous of tendering for any of the various works required in the erection of two semi-detached residences, must send in name and address by above date to James H. Hall and Son, Architects and Surveyors, 10, Market Street, Huddersfield.

Jan. 17. **CHELMSFORD.**—Erection of an elementary school at Trinity Road, Springfield, for the Corporation. Drawings and specification may be inspected, and copies of the bills of quantities obtained at the offices of the architects, Chas. and W. H. Pertwee, Chelmsford, on and after Dec. 30, upon deposit of £2. Tenders must be delivered to W. Smith, Town Clerk, Municipal Offices, 16, London Road, Chelmsford.

Jan. 17. **FLIXTON (near Manchester).**—Erection of an elementary school at Flixton, near Manchester, to accommodate 370 children, for the Lancashire Education Committee. Plans may be seen and bills of quantities obtained at the office of the County Architect, Henry Littler, 16, Ribblesdale Place, Preston, by deposit of £2. Tenders must be delivered to J. W. Whitworth, Union Offices, Green Lane, Patricroft, near Manchester.

Jan. 17. **ENFIELD.**—Construction of pumping station buildings, together with chimney, stores, coal bays, cottage, roadway, drainage, and other contingent works, at Hadley Road, Enfield, for the Metropolitan Water Board. Drawings, conditions of contract, and specifications may be inspected at the offices of the Chief Engineer, Savoy Court, Strand, W.C., on and after Jan. 3. Contractors desirous of tendering may obtain forms of tender, conditions of contract, specifications, list of drawings, bills of quantities, etc., from the Chief Engineer, on production of receipt for £10, which must be deposited with the Accountant at Savoy Court, Strand, W.C. Tenders must be delivered at the offices of the Board, Savoy Court, Strand, W.C.

Jan. 18. **MACCLESFIELD.**—Erection of a detached villa for private patients at the Parkside Asylum. Plans and specifications can be seen at the office of H. Beswick, F.R.I.B.A., County Architect, Chester, and quantities obtained on deposit of £2. Tenders are to be delivered to Arthur C. Procter, Clerk to the Visitors, 23, King Edward Street, Macclesfield.

Jan. 18. **SPENNYMOOR.**—Erection of a new higher elementary school at Spennymoor, for the Durham C.C. Plans, specification, and general conditions of contract may be seen, and bills of quantities obtained at the office of W. Rushworth, Shire Hall, Durham. Tenders are to be sent to A. J. Dawson, Clerk to the Education Committee, Shire Hall, Durham.

Jan. 19. **OLDHAM.**—Reconstruction of roof over gentlemen's swimming bath at Central Baths, for the Corporation. Particulars may be obtained at the Borough Surveyor's Office. Tenders to be addressed to the chairman of the Baths Committee.

Jan. 19. **BROCKHOLES.**—Erection of six dwelling houses at Brockholes, for the Co-operative Society (Ltd.). Plans may be seen and bills of quantities obtained of J. Berry, Architect and Surveyor, 3, Market Place, Huddersfield, to whom tenders are to be sent.

Jan. 19. **NELSON, GLAM.**—Erection of 12 cottages for the Llancaiach Building Club, on Caerphilly Road, Nelson, Glam. Drawings and specifications can be seen with the Secretary, H. Osborne, Commercial Road, Nelson, and at my office. Tenders are to be delivered to Idris Leyshon, Architect and Surveyor, 7, Hanbury Road, Bargoed.

Jan. 19. **COVENTRY.**—Enlarging the Radford Council school, for the Corporation. Drawings and specification may be inspected at the office of the Architects, G. and I. Steane, 22, Little Park Street, Coventry. Forms of tender, with schedule of quantities, may be obtained on deposit of £1 1s., at the Education Offices, Priory Row, Coventry. Tenders must be delivered to Geo. Sutton, Town Clerk, 10, Hay Lane, Coventry.

Jan. 19. **HORNCHURCH (Essex).**—Structural alterations to the school at the Cottage Homes, Hornchurch, near Romford, Essex, for the Guardians of the Poor of the parish of Saint Leonard, Shoreditch. Plans may be inspected, and a copy of the specification, together with forms of tender obtained at the office of the Architect, F. J. Smith, F.R.I.B.A., Parliament Mansions, Victoria Street, S.W. Tenders must be delivered to the guardians at the board room, 204, Hoxton Street, N.

Jan. 22. **SOWERBY BRIDGE.**—Supply of 20 tons (9ft. lengths) of 6in. spigot and socket water pipes, coated and delivered at the Lancashire and Yorkshire Station, Sowerby Bridge, for the U.D.C. Further particulars can be obtained on application to John Hopkinson, Waterworks Manager, Town's Buildings, Sowerby Bridge. Tenders to be sent to R. W. Evans, Solicitor and Clerk to the Council, Commercial Bank Chambers, Halifax.

(Continued on next page.)

Fulwell Hydrated Lime.

A high-class Lime, slaked by a patent process, and packed in bags. Saves the labour of washing and running the lime, will not blow, leaves no waste, may be stored without deterioration and without bursting the bags.

For mouldings and lathwork can be gauged with a much smaller proportion of plaster than ordinary lime.

Converts lime into a safe, reliable and convenient material with the advantages of a bagged plaster.

Further Particulars and Samples from:—

The Exors. of the Late
Sir HEDWORTH WILIAMSON, Bart.,
Fulwell Lime Works, SUNDERLAND.

Official forms with any further information, can be obtained on application to Wm. Nisbet Blair, M.Inst.,C.E., Borough Engineer and Surveyor. Tenders to be delivered at the offices of the Works Department.

(*Continued on next page.*)

A Practical Example

of the advantages of the use of . . .

TERRA COTTA

in large smoky towns may be seen in the adjoining illustration of the London Coliseum, which has recently been cleaned down with a steam brush.

The building was erected 5 years ago and the amount of dirt deposited on a building in the centre of London is clearly shewn by the unwashed portions.

The Terra Cotta used was ordinary hard burned stone colour (which being of one substance throughout cannot shell or craze) supplied by

THE HATHERN STATION BRICK & TERRA COTTA CO., Ltd.,

of LOUGHBOROUGH,

who will be pleased to send estimates for work and samples of their various colours on receipt of quantities or drawings.

Telephone: 611 Loughborough. Telegrams: Bricks, Hathern Station.

Jan. 20. **CHESTERTON.**—Paving the footways throughout Alpha Road, situate in the Urban District, with Atlas artificial stone paving slabs, according to plan and specification prepared by the Surveyor to the Council, and to be seen (by appointment) at the Council Offices, Chesterton Road. Tenders are to be delivered to John D. Bland, A.R.I.B.A., Surveyor, Council Offices, Chesterton.

Reinforced Concrete.

Designs, plans, etc., prepared for any kind of construction, according to client's requirements, and not necessarily on any particular system.—Apply, Box 5460, BUILDERS' JOURNAL Office.

Competitions Open.

TO ARCHITECTS COMPETING.
SCHEMES & ESTIMATES FOR ENGINEERING WORK.

(Lighting, Heating, Ventilation and Sanitation) and Architectural Metal Work, supplied free of charge by STRODE & CO., 48, Osnaburgh Street, London, N.W.

Contracts Open.

WAR DEPARTMENT CONTRACT.

The Secretary of State for War hereby invites Tenders for the following work:—The re-appropriation of A.S.C. Block and erection of additions to provide accommodation for the Royal Army Medical Corps, Millbank, London, S.W.

Plans, specification and conditions of contract may be inspected at the office of the Director of Barrack Construction, 80, Pall Mall, London, S.W., on Monday, Tuesday, and Wednesday, January 3rd, 4th, and 5th.

Those desiring to Tender and to receive a copy of the bills of quantities must apply to the Director of Barrack Construction not later than Friday, January 7th, 1910. The application must be accompanied by a deposit of ten shillings, which will be returned if a bona-fide Tender is received from the applicant. Cheques or orders to be made payable to the Assistant Financial Secretary and crossed "Bank of England for credit to Army Funds."

Tenders, on the form supplied with the bills of quantities, must be delivered in sealed envelopes, marked "Tender for Reappropriation of A.S.C. Block, Millbank, S.W.," not later than twelve noon on Monday, January 17th, 1910, addressed to the Director of Army Contracts, War Office, Whitehall, London, S.W. The Bill of quantities should accompany Tender in a separate sealed envelope, similarly addressed and marked, "Bills of Quantities, Reappropriation of A.S.C. Block, Millbank, S.W.," with the contractor's name and address thereon.

The Secretary of State does not bind himself to accept the lowest or any Tender.

(Signed) H. DELA BERE,
Director of Army Contracts.

War Office,
Whitehall, London, S.W.,
December, 1909.

Partnerships.

ADVERTISERS, having capital and large timber stocks, would like to negotiate with some practical builder, with a view to letting a large, well-lighted Workshop, replete with modern machinery; or would supply timber and undertake the manufacture of joinery, on profit sharing terms.—Apply to Box 5455, BUILDERS' JOURNAL Office.

ARCHITECT, with capital, desires to meet another with an established practice, London preferred, view to partnership.—Box 5449, BUILDERS' JOURNAL Office.

Property to be Let or For Sale.

WHARF Premises, Old Oak Wharf, Willesden Junction.—Canal frontage 684ft., road frontage 123ft., with large substantial lofty buildings, offices, and stables; to be Let or Sold.—J. Higham, 2, Coleman Street, E.C. 5454

Minimising Fire Risks.

Recent great fires—some of them attended by appalling loss of life—by emphasizing the inadequacy of the older methods of so-called fireproof construction, and the futility of the regulations imposed by municipal authorities and fire insurance corporations in the absence of thoroughly up-to-date structural precautions, should convince all observers of the need that still exists for more complete and more widespread study of the problems of fire-protection. There is still prevalent, we fear, a quite unnecessary counsel of despair in this matter—a disposition to suppose that such calamities are inevitable, and that it is not within the power or ingenuity of man to prevent them. This is a false impression that we have for a long time striven hard to remove. In an article on the subject by Mr. Pordage, Firemaster of Edinburgh, which was printed in the Journal last December, there was a remark that possessed a significance which was perhaps not intended by the writer. He said that he could not speak of the behaviour of reinforced concrete buildings under fire, as he had had no experience of such an occurrence. We trust and believe that his vast and comprehensive practice will continue to lack this important item. It is our firm conviction that immunity from rapid and fabric-wrecking fires is principally a question of initial expense. Failing compulsory legislation, a strong endeavour should be made to educate the public to right views on this question. That architects, as a body, are as yet prepared to impart this enlightenment is not plainly evident. For our part, we have repeatedly urged upon them the desirability of devoting more earnest attention to the subject, and have been constantly and consistently careful to provide them with abundant materials for its closer study. One reason for doing this is the desire to see reinforced concrete work become more architectural in character, and it is to that end that we are constantly urging architects not to allow it to pass out of their hands into those of the engineer. The architect should have at least sufficient general knowledge of the work to supervise and control it, even when he feels that it is best to have it executed by specialists. It has been shown in these pages—not least convincingly in those devoted to advertisements (which, in a reputable professional and trade organ, are always of considerable educative or informative value)—that there is hardly an item in a business building that has not been carefully studied from a fireproofing point of view, with the result that the well-informed architect now has it in his power to specify a structure in which every detail shall be non-inflammable. As to the matter of cost, it is almost superfluous to contend that the relative increase is really inconsiderable when the immense advantages are taken into account. Where the use of non-inflammable materials is backed up by wise planning, with the due provision of the means of confining an outbreak to the compartment of its origin, the owner will be almost entirely free from that haunting dread of fire which is the constant bugbear of many a harassed business man, and he will get an immediate return on his investment in the form of a substantial rebate on his insurance policy.

Royal Academy Honours.

Our most sincere congratulations to Mr. Ernest George, President of the Royal Institute of British Architects, on his election as an Associate of the Royal Academy, are tempered by certain regrets. While rejoicing heartily that this well-merited distinction has been at length conferred on Mr. George, we cannot help feeling that it has been too long delayed. Mr. George's signal services to art and architecture should have been accorded this recognition many years ago, when, one would have thought, his many beautiful buildings, and his dainty and charming etchings and water-colours, should have made an irresistible appeal to a body which, however, has always managed to convey the impression that it is grudging of its honours to architects. It was more than fifty years ago (in 1859) that he won the Royal Academy Gold Medal for Architecture! Nor does this late repentance seem very sincere when we see that the full membership so gracefully vacated by Mr. Norman Shaw is conferred, not upon another architect, but upon a painter, thus rendering the Immortal Forty imperfect by the exclusion of a fourth representative of the Mistress Art. Sir John Belcher (1909), Sir Aston Webb (1903), and Mr. T. G. Jackson (1896), no doubt share our regret that for some utterly inexplicable reason Mr. Reginald Blomfield was not invited to complete the quartette. Perhaps Burlington House has become suddenly fascinated with the Eastern doctrine that "all good things are in threes"; but the Western idea is nevertheless to "act on the square."

An Impossible Wall.

Perhaps the time is not far distant when the employment of a properly qualified architect will be compulsory in the case of every building that is erected. This thought struck us very forcibly an hour or two ago while inspecting, no matter in what quarter of London, a building that has been for more than a century used as a workshop. It is really made up of a number of private houses; and as these were gradually added to the establishment builders were called in to perform feats of derring-do that were purely desperate. The party walls were most recklessly riddled with doorways and windows; and, a large amount of light being essential to this particular industry, a wide and high outer wall was simply honeycombed with additional windows, apparently with utter disregard to the stability of the structure. A shop front inserted in this same wall is simply a marvel of absolute foolhardiness. How it was done is more or less of a mystery, but an opening of about 15ft. wide was cut away, and a fine old oak bressummer inserted to bear the weight of the many tons of brickwork that rise for three storeys above it. A sturdy oak strut resting on the sill and supporting the beam was apparently inserted as an afterthought to allay the nervous apprehensions of somebody who perhaps lived in more degenerate days. This many-windowed wall, which would look frightfully unsafe even if it were constructed of reinforced concrete, has defied all the laws, physical and municipal, for more than a century, but is at length condemned, because it has been found that every time a motor lorry lumbers past it, the superincumbent brickwork executes a sort of fandango on the brave old oak bressummer, and the experience is rather exciting. To look at it while it is in serene repose, is to conceive a desire for instant flight, but to behold it gaily dancing requires more fortitude than the average citizen can command, and so it has got to be demolished before it volunteers to dispense with the harmless necessary housebreaker. Its endurance for so long a period is almost beyond credibility; especially when one reflects on the extent to which buildings are over-inspected! But we saw it with our own eyes only an hour or two ago; yet we should not like to hazard a belief that it is still in existence; and in any case we would not incur the very serious responsibility of conducting any daring enquirer within ten yards of it.

A Matter of Business.

The title of an advertising pamphlet that is noticed on this page is, "What is Wrong with Trade?" and the answer to this very vital question seems to be, in effect, that business men are not sufficiently businesslike, and, in particular, that British traders do not make anything like an adequate use of their opportunities. Corroboration of this view is fairly deducible from a striking communication that has just been sent to us from Canada by a firm handling builders' supplies and specialities. "There must be," our correspondents write, "many first-class lines in England and the U.K. that we might handle, but it seems difficult to get hold of them, or when we have got hold of them, the manufacturers do not seem to be prepared to offer the same inducements as the American manufacturers, and the consequence is we handle many American lines." If this complaint were casual and solitary, it might not carry much weight; but, unfortunately, it is only one of innumerable indications that the Prince of Wales's exhortation, "Wake up, England!" was only too completely justified. It is not that British traders are lacking in courage and enterprise in great matters; but apparently they are rather disdainful of close attention to the minor details that count. The British trader is too prone to rely implicitly on the worth of his goods. It is somewhat difficult to convince him that in these days of keen competition merit and reputation must be backed up by publicity and "pushfulness." The proud boast, "Our goods speak for themselves," is vain and fallacious where it operates as an excuse for failing to advertise them adequately. We are convinced that many a firm could double or quadruple its output but for the two reasons indicated by our Canadian correspondent—namely, that the goods are not kept sufficiently in evidence by persistent advertising, and that many opportunities of trading are wantonly thrown away by the adoption of an inflexible attitude with respect to terms and conditions. As being ourselves of the old British breed, we must confess to considerable admiration for the old-fashioned obstinacy of the trader who says, with a grand air of finality, to all and sundry, "Those are our terms; take them or leave them." The attitude is dignified, not to say heroic; but it does not pay. And we imagine that, after all, our traders are not in business with the object of airing their manly independence, but to make money, and we trust that this little lesson from Canada will not be lost upon them. Very possibly the question is not chiefly a matter of price. That is a detail which is largely regulated by the sheer quality of the goods; and we have a most robust belief in the merits of British manufactures; but if they are to take their due place in the markets of the world, their virtues must be duly proclaimed, and their vendors should not shut the door against themselves by too rigid and too arbitrary an insistence on invariable conditions or methods of business. In other words, the merchant should show more adroitness in adapting himself to variable circumstances. To adopt the words of our Canadian correspondents, he should take every care not to make it difficult for the would-be customer either to get hold of or to handle them. Otherwise he is playing into the hands of his foreign rivals, whose goods may be inferior, but whose methods are notoriously more pushful and more accommodating.

Obiter Dicta.

The Spread of Cement.

How cement is regarded in the building world was clearly shown at the recent New York Building Code hearings, when effort was made by competing interests to restrict its use. More and more it enters into the modern high-class building, and it has already extended from this type to smaller structures.—"*Cement Age*" (*New York*).

A Good Time Coming.

As one who has access to the statistics of the world, I have every hope that the period of depression will pass rapidly away. In the course of the present year there will be a most marvellous improvement in trade. Any political party that got into power might claim the benefit of it, but the world went on whichever party prevailed.—*Mr. G. R. Askwith, K.C., at the West of Scotland Iron and Steel Institute.*

Eastern Arts and "Alhambra Rot."

The artistic horizon of the West having been widened so as to include Japan, it is not surprising that another Eastern country —India—has also appeared within the field of æsthetic vision. This is a more recent development, and the same process of accepting the art of India, by instalments, is observable as in the case of Japan. Indian decorative art is now generally comprehended, but the fine arts of sculpture and painting are still regarded with an indifferent eye. Thirteen years ago a well-known artist and traveller wrote as follows concerning the attitude of certain great authorities in England with regard to Indian art: "They recognised only the art of Greece and Rome, stigmatising everything, in India as 'Alhambra rot.'" Fortunately, as far as industrial art is concerned, the "Alhambra rot" party has passed away, and Indian decoration in its highest forms is meeting with the just estimation from the West that it undoubtedly deserves. . . The old intolerant spirit is decidedly dead, but the new school that has taken its place has not yet realised that in the fields of picture painting and sculpture India, like every other civilised country, had its recognised form of expression.—*Percy Brown* (*Curator, Government Art Gallery, Calcutta*), *in the "Nineteenth Century" for January.*

The World's Great Walls.

Apart from Chinese folk-lore, there seems to be a pretty common consensus of opinion that the Great Wall [of China] was a defensive military work, either to guard the Northern frontier against the Hiung-nu and other peoples of Mongolia, or to cover the trade-route to the West. Such fortified lines are to be found everywhere; they are frequent of mention in the pages of historians both ancient and modern. I need only allude in ancient times to Nebuchadrezzar's "Wall of the Medes," the Long Walls of Athens, the lines by which the Thebans in their death-struggle with Sparta covered their territory, and Antiochus Soter's 180-mile rampart round the Marojian Oasis.—*Edward A. Foord, in the "Spectator."*

Decoration Prevents Destruction.

The main building, flanked by two wings, built in red brick picked out with white stone at the corners and round the doors and windows, still stands as it did when it was designed by Jacques Bruand, one of the great architects of the days of Louis XIV. . . . The house was saved from the fury of the mob in the days of the Revolution. They had discovered fleurs de lys on the gateway, and had condemned the château to be burnt. A friend of the family was one of the crowd, and he boldly asserted that they were not fleurs de lys but fleurs de lances. Discussion waxed fast and furious, and the ridicule which they poured upon the man who had made this diversion made the mob forget that they had come to raze the house to the ground.—"*Saturday Review.*"

St. Paul's, the Impressionist, and the Fog.

Now we are close to St. Paul's Churchyard. Here the mausoleum night [of fog] is lifted for a space, and out of the blankness of an umber-tinted vast swells forth a vague and mystic bulk of grey, a shadow without shading or relief. It is the immense cupola of the Cathedral vising like a mountain above the streets. The sun does battle with the flying mists about the dome, and melts them to a dull and sullen gold, wherein the star of day hangs like a quivering globe of blood. It is a spectacle of sombre yet soft sublimity, such as only the towering imaginations of a Turner, a Doré, or a John Martin, expressed by brushes of opulent wealth and daring power, might conceive or execute.—"*Academy.*"

Who Invented the Slide Rule?

I agree with Prof. E. Cajori in thinking that the Rev. William Oughtred was the first to suggest that calculations could be made more accurately and rapidly by sliding the edges of logarithmic scales together than by using compasses—the method adopted by Gunter; but Oughtred had a poor opinion of this device, and rightly considered that his circular scale was a great improvement on it. A few years before 1671, Seth Partridge rediscovered the sliding principle, perfected it, and gave an almost complete specification for the slide rule which is used to-day.—*Alexander Russell, in "Nature."*

"THE SEVEN STARS," MANCHESTER.

Of the few remaining portions of mediæval Manchester, perhaps the most interesting is "The Seven Stars." This old inn, situated in Withy Grove, the heart of the city, undaunted by the storms of centuries, remains a strong and sturdy monument to the early builders of the half-timbered style, so famous in this country. Its licence, granted in 1356, makes it the oldest licensed house in Great Britain. Besides its picturesque outward appearance, there is much within which commands the attention of the visitor. The disappearance by sale of many grand old pieces of furniture within recent years, is much to be regretted. The valuable, though small, collection of antique silver is very interesting, so also is the grandfather clock, standing where it is said to have stood for over 200 years, on the staircase. The inn was connected to the Collegiate Church, now the Cathedral, in days long since past, by a secret underground passage, the entrance to which has been bricked up, only an arch of early date in the cellar indicating where once the entrance existed. It is to be hoped that Manchester will endeavour to retain this charming and rare link with the past.

We are informed that the extensions to the Victoria Hospital, Accrington, are being warmed and ventilated by means of Shorland's double-fronted patent Manchester stoves, with descending smoke flues, patent Manchester grates, and ventilators, supplied by Messrs. E. H. Shorland and Brother, of Failsworth, Manchester.

* * *

"What's Wrong with Trade?" is a wise, witty, and withal daintily artistic booklet that has been issued by Carl Hentschel, Ltd., the process engravers, whose head offices are at 182-4, Fleet Street, E.C., setting forth the advantages of persistent advertising, and showing the best methods of doing it, and more particularly the spirit in which it should be done. Incidental references to the services that can be rendered by Messrs. Hentschel in providing the illustrations that are essential to prolific publicity are very cleverly insinuated. The booklet (which has on the cover a characteristic Hassall illustration in colours, as well as some peculiarly dainty little marginal sketches, is one of the best persuasives to advertising that we have ever seen.

ENGLISH AND CONTINENTAL IRONWORK: A COMPARISON.*

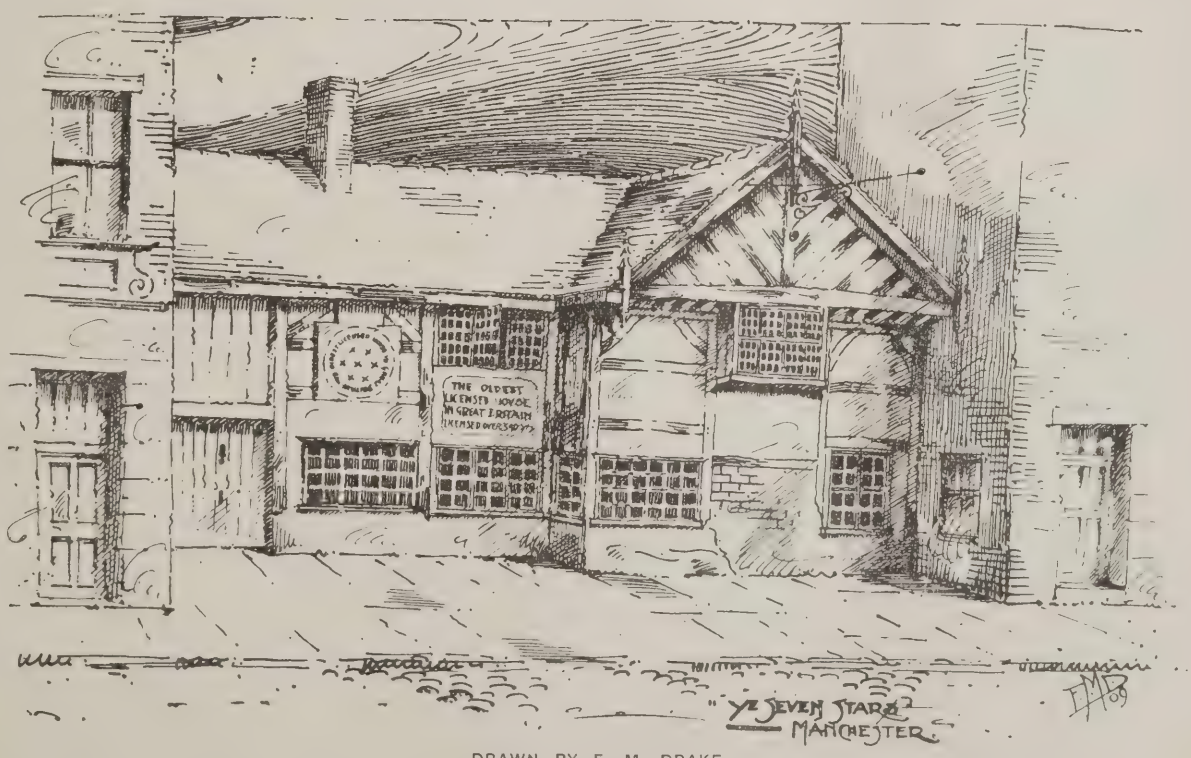
By J. Starkie Gardner.

Throughout the Renaissance period in France the ironwork, like the architecture, was traditional, but profoundly influenced by that of Italy, for François I. and Henri II. and his consort encouraged Italian artists to work and settle, just as his contemporary Henry VIII. encouraged them to settle here. His fickle continental alliances, however, led him also to favour Germans and Flemings. Such influences were not lasting as regards ironworking, and, except richly decorative locksmithing, which had always been a cherished art in France and neglected here, the ironwork in both countries was alike meagre and utilitarian.

The French Revival.

The first indication of a revival is seen in France, and practically coincides with the accession of Louis XIII. in 1610. The Italian influence had long since waned there, and Henri IV. had himself suffered through it. It is true that ironworking was in full swing in the bordering countries of Germany and Spain, where the smiths were indulging in *tours de force*. But the revival in France is absolutely free from any trace of the influence of either of these countries. It was a new style, gradually evolving, elegant and restrained, in the native taste, but with an ever-growing tendency towards the rich and sumptuous curves and scrolls of the Baroque. Rubens had a commanding influence in France from 1622, when he was decorating the Luxembourg for Marie de Medici, almost to the time of his death. The arts, painting, sculpture, and architecture, felt his influence deeply, how should ironworking escape it? Rubens may personally never have prompted a design in ironwork during his life, but he powerfully influenced, if he did not inaugurate, the sumptuous freedom and splendour of colour which characterised French art for upwards of a century. The ironwork followed the same line as far as the material permitted, and, as might be expected from a material so facile when hot, and in the hand at the outset of gifted craftsmen, wholly unrestrained by traditions and rules, it developed even more rapidly, but more consistently, than in Spain or Germany. Ironworking became a firmly established art in France, and it remained so, apart from modifications due to changes of fashion and sentiment, until the monarchy itself ceased to exist. To trace its development, however, is a difficult task, and one I am not qualified to follow up to-night. The French smiths began to engrave and publish their designs in 1615, following the example set by Androuet du Cerceau. Louis XIII., who died in 1643, had been a great patron, and it is certain that much fine ironwork had come into existence in France during the first half of the seventeenth century, which could hardly fail to attract the attention of travelling Englishmen. The rails round the statue of Henri IV. on the Pont Neuf, ordered by Richelieu in 1640, were lofty and of plain bars with a rich cresting, and Evelyn notes them as a "strong and beautiful grate of iron." He also observes, under date 1649, of the gardens of the Château de Maisons, "the yron gates are very magnificent." These were perhaps those by Jean Marot, who was but thirty years old, but his illustration of them was not published till much later. They would well deserve the encomium of "very magnificent," for they are indeed the well-known gates that now, brilliant and polished, close the Galérie d'Apollon of the Louvre.

*Paper read by Mr. J. Starkie Gardner, on Jan. 14th, before the Architectural Association.



The Widening of the Field.

It is strange that the taste for rich ironwork did not at once penetrate from France to England under the artistic and cultured Charles I., who was such a princely patron of Vandyke and Rubens. Under Cromwell the English Channel was probably a *mare clausum* to French art; but it is almost wholly inexplicable that the reign of Charles II., with its influx of highly skilled Huguenot craftsmen, should have failed to welcome it, just when it was at its zenith in France. As the young King Louis XIV. expanded into the *grand monarque* towards 1660 the field for the smith's art rapidly widened. Royal and noble palaces were approached through spacious courtyards surrounded by iron railings with magnificent gates; while the gardens, parks, and avenues by which they were environed demanded elaborate iron fences, gates, and wickets. Staircases were enlarged into grand architectural features of palatial dimensions, and occupying central positions, required iron balustrades of the most sumptuous possible character. The smiths, thus stimulated, naturally vied with each other in the magnificent pride of their work and the increasing difficulties demanded from its execution. The greatest architects entered the arena of rivalry and supplied the designs. Mansard designed the screens for Clugny and for Meudon; Girard that for St. Cloud, and Gittard that for St. Maur. Men of such boundless influence as Jean Lepautre, Jean and Daniel Marot, Jean Bérain, Jean le Blond, and Langlois, published *Livres de Serrurerie*, or included numerous designs for smiths in their works on ornament. Lesser men followed suit, while the smiths themselves by no means desisted from publishing pattern-books of their own work throughout the reign. These publishers among the craftsmen were, as in all times, by no means the best workmen.

The commissions given by the King for Versailles alone amounted to over a million livres between 1664 and 1680. This extravagance led to the disgrace, and thus, indirectly, to the death of Colbert; as a mistake in the measurement of a window led to a quarrel with Louvois, who only averted disgrace by plunging the *Roi Soleil* into a new war. Of these works, the smiths, Godignon and Dezeutres, executed the great screen, and Luchet the gates, to the Court of Honour at Versailles, at a cost 32,500 livres. Simon Delobel made the doors to the *escalier du Roi*, and numerous balconies; and Caffieri and Lespagnandel the stair-rail. The Royal work was divided impartially, and every capable smith had his share. There was work for all under such a patron.

England Backward.

Though Charles patronised Frenchmen like de Grammont, and raised Louise de la Quérouaille to the peerage, and had his grounds laid out in the French taste of Le Notre by Verrio, no ironwork in the French manner appears in England during his reign. Such as there is is extremely plain, not more advanced than that produced in France a hundred years before.

DRAWN BY F. M. DRAKE.

This, the oldest Inn in the country, had its licence granted first in the year 1356.

There are however a few notices and other slight indications of the existence of some more decorative ironwork scattered here and there, but not enough to be convincing. It is strange, too, that Wren was in Paris in 1665, "prying into trades and arts," as he wrote home, while the superb gates, railings, and balustrades to the Palais Royal, the Bibliothéque, and the palace at Fontainebleau, and in many of the churches were already in position, work such as had excited the admiration of Evelyn sixteen years before passed without notice by him. Wren was no doubt impressed, but he showed no desire to encourage similar work at home.

On the contrary, there is a curiously plain and geometric pair of gates to the Ashmolean at Oxford, built probably by Wren in 1677. The railings to the Sheldonian Theatre at Oxford, completed in 1668, are interesting as associated with a building erected by Wren so soon after his return from Paris. The bars are lofty and straight, but perfectly plain, with the horizontal low door, the only relief being a scrolled head to the central standard of each bay. These are between the great stone piers with heads of fawns—a landmark for visitors. A contemporary engraving shows them to have been put up with the building. A pair of gates of the same construction and destitute of ornament still remain in the corridor behind the rich and later gates of the Clarendon Press.

The taste for fine ironwork was thus clearly not due to Wren, who apparently appreciated it as little as his great predecessor, Inigo Jones.

Tijou Comes to England.

The accession of James made little difference, and it was not until the arrival of the Prince and Pricess of Orange, who were inimical to France, that a taste for rich ironwork in the French manner arose in England. The year 1689 is a momentous one in the history of English smithing, for it introduces "M. Jean Tijou," a mysterious person as to whom little beside his work is for certain known. He was no doubt a French Protestant with whom the Princess of Orange must have been acquainted before or from the moment of her arrival in England. It can, therefore, be safely inferred that he was one of the French Protestant refugees in the Netherlands, and that he came over in the Princess's train. He was unknown, or had at least published nothing, for Guilmard, in his exhaustive work on the *Maitres Ornamentistes* only records him as a *dessinateur anglais* who worked towards 1720. It seems he became a parishioner of St. Martin's-in-the-Fields, for his daughter was married there to Louis Laguerre, the French decorative artist and pupil of Verrio. A Mrs. Ann Tijou, possibly his mother, who died in 1708, another Tijou, and Laguerre were all buried there, and descendants still live in Soho. His own place of burial and residence and his wife's are unknown, and no will was proved.

However, scarce had the Prince and Princess become King and Queen before Tijou rendered his first bill for six iron vanes "finely wrought in leaves and scroll-work," £80, and a rich iron balcony, over the river, to the water-gallery, where the Queen was to reside while the Palace was building. In this balcony she and her maids were accustomed to sit, work, and receive visitors. His second bill, still extant, was rendered in 1690 for the famous garden screen, £755 7s. This was for the Fountain Garden, a semicircle taken out of the Home Park by Charles II., and which Evelyn saw finishing in 1689. It comprised five fountains and three broad walks, two to the great avenues in the Park, the third to the head of the Long Water. Such a screen, of unusual extent and richness, was required perhaps to insure privacy, while clipped yew hedges, beloved of the Dutch, were growing, for the garden faced the principal front of the Palace, and was the first laid out for King William and hurriedly completed. Two "lion gates" formed part of the screen. This work for the water-gallery and garden being finished, there was probably a lull till the new Palace was ready, but in the interval Tijou was at work elsewhere, the Chatsworth work being completed before 1692, at a cost of £528; and on that at Burleigh; and perhaps he was also getting on with the magnificent gates for the triple arches of the new front to the Palace, opening to the garden. They still exist, and are examples of his richest work, and standing in shelter they remain to this day in perfect preservation. Each consists of one oblong panel half the height of the gate, a wide and richly-worked lock-rail, and a square panel beneath, the central pair of the three being the richest. The upper panels are scrolled round a central oval, the whole almost hidden by embossed acanthus and flowers. The lock-rail is as rich, and the square panel below repeats a four-way scrolled design radiating from a centre. All are in the rectangular double frames joined at the angles by short diagonals characteristic of his work. The side gates are similar, but less rich, and above them is a lintel of scrolls and acanthus. They form the chief item in Tijou's 1694 bill for £1,153 12s. 6d., which comprised some plain staircase rails. Two other pairs of gates are shown in Sutton Nicholl's engraving of 1695, which no longer exist at Hampton Court, though one may now be at Eaton Hall.

Tijou's Book of Designs.

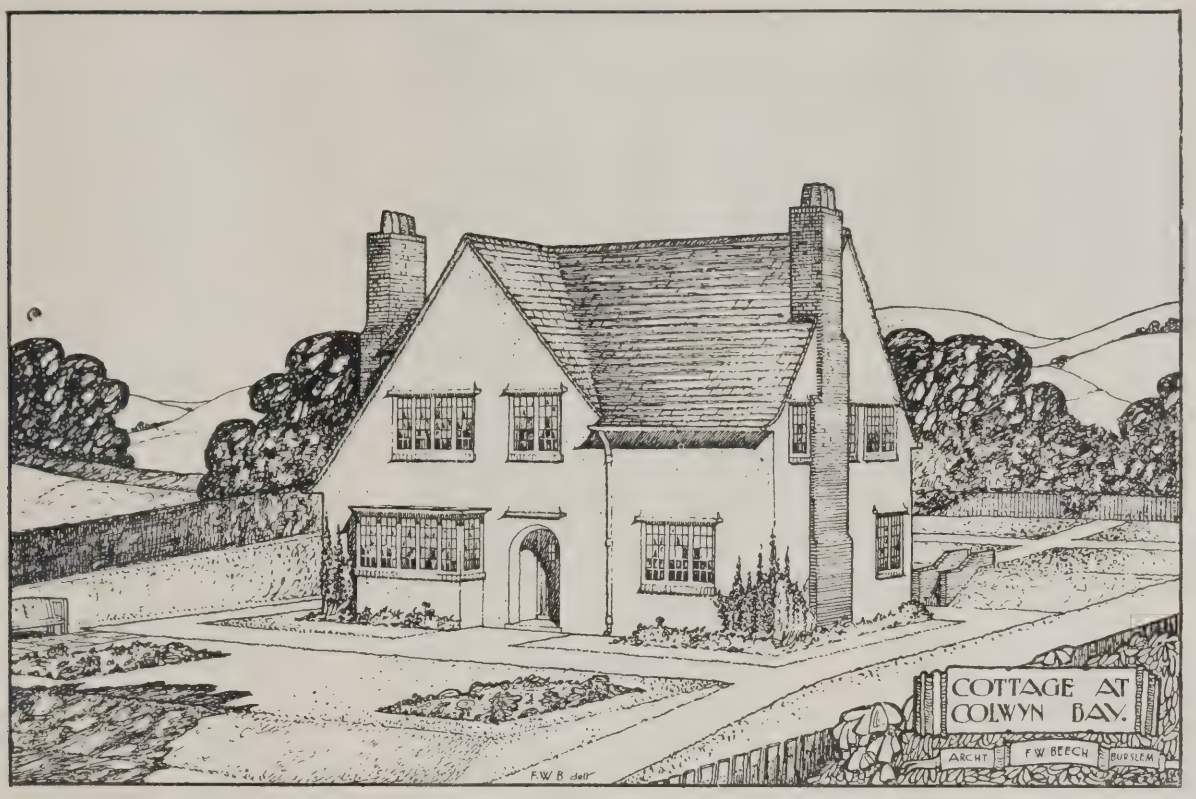
From these bills it is clear that from the moment of his arrival he was under the immediate patronage of the queen, who is known to have taken the greatest interest in the gardens and probably ordered the ironwork personally, and on her own initiative, the King, as is well known, being too much occupied and away. In 1692 he published his great book of designs, and paid her Majesty the graceful compliment, as it then was, of portraying her as Juno reclining, attended by Vulcan, Mercury, Saturn, amorini, and a group of the Arts. The man in the frontispiece, with strongly marked features, long hair, and heavy moustache, in redingote and cravat, who is closely inspecting the work of four brawny smiths, is almost certainly Tijou himself, a portrait by his talented son-in-law, Laguerre, who designed it. The other engravers were well-known artists hailing from Antwerp and Amsterdam. This most expensively got-up book is the first of its kind ever published in England, and introduced the custom long before in vogue in France. It is marked as on sale in London without further address, proving that he resided here and believed himself to be a well-known personage. The plates comprise, in addition to designs for Royalty, those for Chatsworth, Burleigh, and Wimpole, with others impossible of execution in iron. The book was "for the use of smiths." Partridge, a London smith, seems to have borrowed one of the baluster designs for the library staircase of Trinity College, Cambridge, built by Wren.

In 1694 a heavy and unforeseen misfortune befell Tijou in the lamented death of his great patron the Queen. Work at Hampton Court practically ceased in consequence till the destruction by fire of Whitehall Palace, in 1698, drove the King to complete it. The Fountain Garden was enlarged for eight additional fountains, and the beautiful screen was removed to the Privy Garden on the south front, then being laid out, where £832 was apparently expended on masonry to receive it. The gates remained still to shut off the garden walks from the Park avenues, and the balustrade for the King's staircase, designed five years before, was ordered from Tijou. This enlargement of the garden and removal of the screen, necessitated 1,442ft. of new iron rails with 172 panels for both sides of the Fountain Gardens which were designed by Talman, clerk of the works, who also estimated the cost at £2,132 16s., at 5d. per pound. Tijou undertook the work, but charged £3,675 for it, and a balance of £1,889 1s. 6½d. became the subject of appeals and petitions. It was unpaid, when William III. died in 1702, and Anne, who cared little for Hampton Court, was loath to pay her own bills, much less those of her predecessors. Tijou enjoyed no more royal patronage, and Talman was not the man to pass such an overcharge. Other existing works of his seem to be gates at the Clarendon Press and Bridewell, similar to those of the triple arch, an entrance to Burley-on-the-Hill, and part of the work at Drayton House.

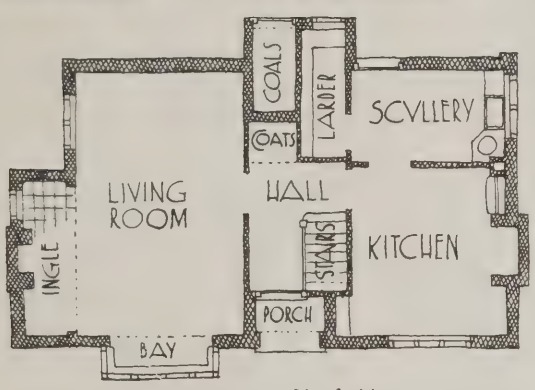
Tijou's Work in St. Paul's.

His work in St. Paul's is well known. It commenced as early as 1691, with windows for the choir at 6d. per pound, which were made at Hampton Court and brought to London. All the panels, screens, altar-rails, choir-gates, and balusters, in which embossing is extensively used, are by him, apparently aggregating to a total of between £4,000 and £5,000, and extending over a period of nineteen years. His work finished in 1711, when he pressed to have his account settled in terms which make it appear that he was not in easy circumstances after twenty years of work. He left the country, leaving his wife to collect the money and follow him, the family tradition says, broken-hearted. At St. Paul's the plainer work was only given subject to competition with two English smiths, one of whom undersold him. He probably went to Paris to dispose of his copper-plates and designs to a celebrated smith named Fordrin, who later republished them in his own name. He is reputed to have worked at Canons, but if he commenced there he must have abandoned the work, leaving it perhaps to his assistants.

That Tijou was an artist of the first rank in his day can never be disputed. He must certainly have executed the masks and finer embossing with his own hands, for it is by a master. It is also clear that he set out his own work, for a joiner is paid for glueing boards for Mr. Tijou to draw the iron screen upon. We may reproach Tijou for redundant richness, and that the actual smith's work is little more than material to hang his foliage on. He was clearly an artist and an embosser, but never a practical smith, as is evident from the designs he published.

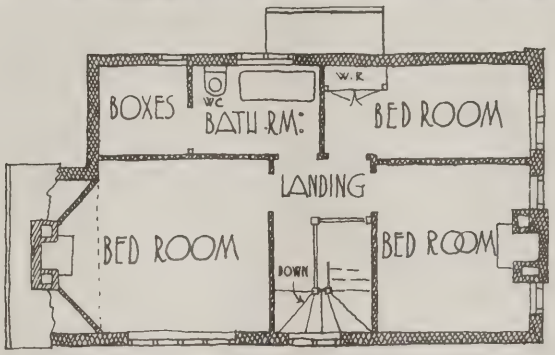


Huntingdon Shaw.



The credit of the work has been assigned to Huntingdon Shaw, a smith of Nottingham. There is no evidence to sustain such a claim, which rested solely on the inscription on a monument in Hampton Church, and it has been conclusively demolished. We may, however, believe that the tradition had some basis of fact if we please, for Tijou must have had a working foreman, his works were for a time at Hampton Court, and Shaw's death in 1710 almost coincides with Tijou's relinquishing business. Shaw was never either a master craftsman or designer, and as far as actual proof goes there is none whatever that he was even a smith. His estate nevertheless adorns the new Victoria and Albert Museum, as our only representative of smithcraft, though an official inquiry made by the Board of Education had demonstrated that Shaw's name is nowhere recorded in connection with any ironwork at Hampton Court or elsewhere.

I have dwelt at some length on Tijou, for whatever we may think of his work, and no one visiting St. Paul's can deny that it is appropriate and beautiful, he alone raised smithcraft from the lowest level into a flourishing craft, patronised almost immediately by Royalty, and almost the entire aristocracy of the country. As designs, most are essentially in the French taste of Louis XIV.; but when executed the work becomes something different. Whether modified by the taste of the patron, or the architect with those buildings it is so generally associated, it appears, as I am pleased to think, more English in design, less grandiose and assertive, stronger and more practical.



Wren Ignores Tijou.

We have some ground for believing that Tijou's very florid ironwork was not to

GROVND PLAN

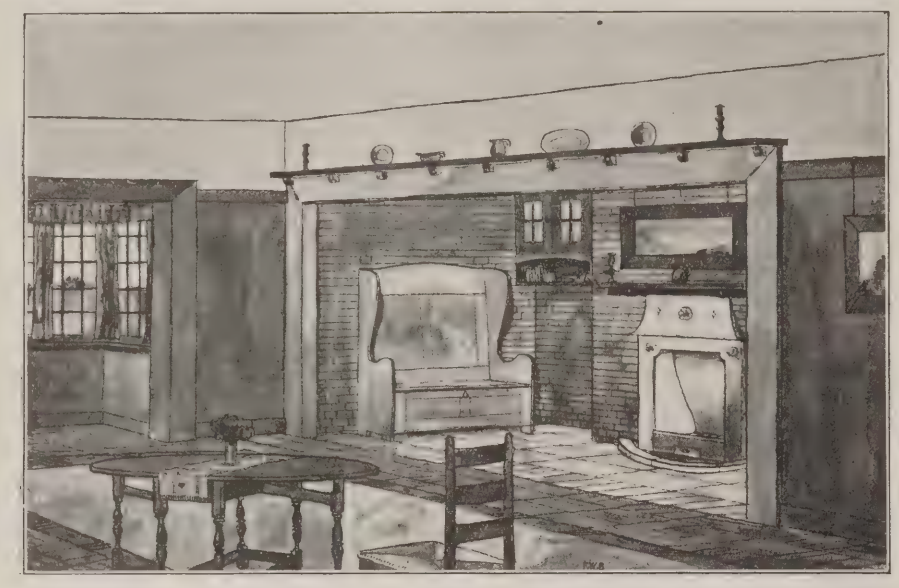
FIRST FLOOR PLAN

COTTAGE AT COLWYN BAY. F. W. BEECH, ARCHITECT.

This cottage has been erected in the Nantyglyn Valley, and has beautiful mountain and sea views. The front and side elevations are rough cast and the windows have lead lights with wide cames. The roof is of brindled sand-faced tiles. The ingle nook is faced with narrow sandfaced bricks with wide joints. The living-room has a wood block floor. All interior woodwork is treated with two coats brown Solignum, and all exterior woodwork two coats grass-green Solignum. All doors have antique Norfolk latches. The cottage has been built from the designs of Mr. F. W. Beach, of Burslem, by Messrs. Bond and Sons, of Colwyn Bay.

Wren's taste, and, therefore, that he was no willing patron, for, while he extols Grinling Gibbons in his memoirs, he is silent as to Tijou. This is strange after an association of twenty years. Tijou ignores Wren in the dedication of his book of designs; he sent his estimates and bills direct both to the Crown and to the Cathedral authorities, and the indoor work at Hampton Court, such as would naturally be left in Wren's hands, like the balustrades to the King's and Queen's back staircases, the Privy stairs, Lord Portland's, and others, are as plain as can be, with no traces of the beaten leaf work of which Tijou was so lavish.

When Tijou disappeared, his apprentices, assistants, smiths, or whoever he employed must have remained. Whether he actually brought any foreign workmen with him is unknown, but none are heard of after his departure. Presuming Shaw to have been his foreman of works, he, too, had departed, and the road was clear for successors. The only work in the Home Counties, however, that can certainly be attributed to a pupil is a pair of gates made for Canons, and now at the Durdans. They are designed after Tijou's style, but not carried out by a masterful hand.



Robert Bakewell.

Robert Bakewell was probably one of his original assistants, but must have seceded before 1707, perhaps from ill-health. He adopted Tijou's style, but diverged from it greatly as time went on. He made a summer-house for Melbourne, the work on which was interrupted by long illnesses, and not finished till late in 1711. He then set up a workshop in Derby, and his work is widely spread over this and neighbouring counties. We hear of him for over a dozen years more, and he probably worked on much longer. Two brothers at Chester followed more or less in Bakewell's footsteps, and produced some very important and noble and original forecourt screens. They may have worked at Drayton House, but so far are first heard of some time after Tijou had departed. A very fine smith at Bristol had a great vogue round about, and executed splendid work in the manner of Tijou, though his designs were often weak and bizarre. These men practically monopolised the West Country and the Midlands, but, strange to say, no disciple of Tijou's settled in the Metropolis, and the very distinctive styles these men introduced died out with them.

Thomas Robinson.

The English style came into existence and developed side by side with Tijou's work. As far as can be traced at present, Thomas Robinson is the man to be most honoured.

The earliest mention of this name I have yet met with is in 1697, when he had produced the beautiful railing to the Morning Prayer Chapel in St. Paul's Cathedral. The fine leaf-shaped spikes on hollow balls, fashioned by the hammer, the latter from sheet-iron, and the more massive standards between, are excellent work in the English spirit. Two years later we find Robinson supplying the wrought windows for the Cathedral at 5d. per pound, when Tijou was getting 6d. Later other work followed, which it is needless to specify. The Cathedral accounts showed that he was employed until 1711, when Tijou's departure left him a clear field. In this year he was erecting the very fine gate and railings at New College, Oxford, and an eye-witness records that he was an "ingenious" smith, at that time the term of highest praise, and that his works were at Hyde Park Corner. There are thus several works known of his, and from these it is possible to identify many others, though less certainly than in the case of Tijou's followers, whose mannerisms leave us in no possible doubt. Conditions of work in London make it so very easy to appropriate other people's ideas. Other names have come to light, men perhaps taught in Robinson's workshops, and yet others will be discovered, all working practically on much the same lines. Robinson, however, must have had a long career or very capable successors. Indeed, I have been told that the firm con-

COTTAGE AT COLWYN BAY. F. W. BEECH, ARCHITECT.

The living-room, of which this is a view, has a wood block floor. All interior woodwork is stained with two coats of brown Solignum. The ingle nook is faced with narrow sandfaced bricks with wide joints.

tinued as a foundry on the site of Victoria Station till the railway took it over. The effects aimed at by Robinson were lofty and perpendicular, never horizontal, and he obtained them not only by carrying the bars to a great height, but by avoiding interruption of their vertical lines by horizontal ones. The piers were carried right up through and interrupting the top horizontal without any break, and were relatively slender and surmounted by high pyramids of scrolls and finials, with perpendicular effects like those of the Gothic architecture around. The finely designed overthrow to the gates is also aspiring and lofty, and the whole design remarkable for its sparing use of embossed work, a rich appearance conferred by the numbers of sharply crinkled welded water leaves, which diffuse a beaded look over the whole surface. The contrast between this and Tijou's work is very striking, for he and his school never purposely aimed at obtaining commanding and lofty effects by the use of uninterrupted vertical bars, but sought them chiefly through the magnificence and richness of detail of the embossed work.

The Finest Screen in England.

Robinson repeated his success at Trinity College, Oxford, where little of his work now remains, and it seems safe to regard the fine works at Belton and at Beddington as his, these having similar characteristics. It is more difficult to claim for him the immense screen or grille at Carshalton Park, which presents the most dignified and grandly perpendicular effect of any screen in England. This is obtained largely by using massive vertical bars for the piers, which are unusually severe, with solid caps and bases, and limiting and concentrating the scrollwork with telling effect. It was probably erected after 1723, when plans and elevations for the contemplated mansion were engraved. The design betrays French influence, but further research will, I believe, disclose more facts.

By analogy and inference many of the most scholarly and best designed gates in and around London would be assigned to Robinson, among them the gates now at Devonshire House, which our valued friend, Mr. Phené Spiers, has traced back to Lord Heathfield's house at Turnham Green, probably not their original site, whence they were brought in the last century to Chiswick, and quite recently to Piccadilly. There are gates at Clandon Park of the same make, the real history of which is lost in a tradition that they were brought from Naples. I am engaged in classifying and unravelling the history of the numerous gates still existing in London and its environs, now, alas, very rapidly disappearing! This is a difficult task, as appropriation of ideas has always been so easy in London that few distinguishing peculiarities can be relied on.

One rival to Robinson is a smith, presumably of London, who executed several magnificent works in and around Cambridge and elsewhere, with a sufficiently distinctive style.

The Tijou Tradition.

It does not appear so far that any English smiths were directly influenced by French work, except through Tijou, who had been the sole channel, and had introduced by his own example alone a taste for richly worked wrought-iron into England. Entirely French at the outset, it was but natural that Tijou, who was a genius, should after twenty years of residence in England and of intercourse with English patrons and architects, bring it somewhat into line with English sentiment, which in the main is wholly different from the French. Those who had been immediately associated in his work followed his ideas and traditions, but these almost died out in a single generation. On the other hand, our smiths, who were onlookers, caught some of his enthusiasm and imbibed his ideas, but had to find out for themselves how to put them in execution. Embossing, to those who were brought up as smiths, was a difficult, tedious, and expensive process, and they therefore used it sparingly, their designs being modified to suit this condition. Thus was produced the English school of ironwork, of well-knitted, restrained, and graceful lines, combining a simple dignity and fitness which harmonised so admirably with the national temperament and general surroundings. The essentially English treatment may be described as refined, and never approaching the commonplace or vulgar.

Gibbs's Designs for Ironwork.

We were, however, at all times of our history open to receive French fashions and impulses, and ironworking was not altogether exempt. Architecture certainly borrowed much from France, but Gibbs's book of architecture, published in 1728, is the first book by an English architect which includes designs for ironwork. Two plates are devoted to forecourt screens and one to gates. The forecourt for country mansions, however, had become almost a thing of the past before the book was published, and apparently none of the designs were ever executed. The designs appear to be adapted from the French, particularly from the grilles and gates to the front of Versailles, and are evidently subject to some definite and unexplained rules of proportion, for though variety is obviously aimed at, either design might be chosen indifferently, for all produce the same effect. The details are not all actually different from those then in use by our smiths, but purely French details are recognised in the railing with pike-heads and tassels, and the borders of small circles, of which we have seen so much in our London park gates of late. Massive cast baluster standards are also introduced, like those of the railings to St. Martin's-in-the-Fields.

The grand forecourt to Wentworth Castle, built about 1715, with its wide and stately bowed front, also presents a similar sweep of railings to that of Versailles, with lofty gates and wickets in the French taste. These are of long, vertical bars, with the lock-rail low down, under a rich overthrow, horizontally treated, with a pyramid scrolled top comprising the fully displayed arms and supporters of Thomas Wentworth, Earl of Strafford. Many other details suggest French design.

Powis House, in Great Ormond Street, was burnt in 1712, while occupied by the French ambassador, and rebuilt in a sumptuous manner by Louis XIV., who defrayed the cost, though the building was insured. The ironwork is of the utmost richness, and was probably renewed by order of Louis XIV. It is less distinctly French than that to Wentworth, but the fleur-de-lis terminals to the scrolled pyramid tops of the railings, and the magnificent scrollwork buttresses to the gates, etc., are unmistakably foreign. The gates to Newcastle House, in Lincoln's Inn, were also typically French. These have disappeared, and I believe the enclosure to the forecourt at Elvaston is really almost the only one actually of French make existing in England. It is said to have come from the Palace of Madrid, presumably the one near Paris, though I have failed to find any illustration of this château showing such an enclosure.

With the publication of Gibbs's book smithcraft seems to have waned. The few gates that are dated are plain and massive, like those to Gray's Inn and the Temple, and of about Gibbs's date. The grilles to the Mansion House and Bank of England are heavy and severe. The screen to the forecourt of the Horse Guards was probably designed by Vardy, though illustrated in Ware's "Body of Architecture" in 1756. Two or three guides for smiths published at about this time chiefly reproduced French designs. Batty Langley, in his "Ancient Masonry," took his bodily from a German, J. J. Schübler. Jores borrowed from Huquier, and the plates of the "Smith's Right Hand" are also taken chiefly from French sources. Few, if any, of their designs were ever carried out in England.

Discussion.

Mr. Matt. Garbutt, in proposing a vote of thanks, observed that he had rather misunderstood the title of the paper. Instead of being a comparison between English and French work, it was chiefly a careful account of the work of Tijou and the English smiths that succeeded him, and whose names were comparatively unknown. He was much pleased that Mr. Gardner had made such valuable discoveries with respect to English ironwork, which, in common with most artistic work, had received very little appreciation. They had seen a fine selection of illustrations, which were nearly all the work of Tijou. They were not, however, all examples of blacksmithing. It was seldom, indeed, that they got a piece of pure blacksmithing. He remembered referring to a piece of ironwork, while in conversation with a smith, as being the work of a blacksmith. "Oh," said the smith, "that's not blacksmithing, it's joiner's work." The operation in question consisted of cutting the bar iron while cold, and mortising together as a joiner would treat a piece of timber. The use of embossing, and sheet work, was characteristically French, and it appeared in the English work which had been derived from the

French. When they came to consider the vast amount of work that was attributed to Tijou, it became evident that in a good deal of it he could not have had much personal control. In bulk, it was the many years' work of many men. Mr. Garbutt then referred to an elaborate example of Tijou's designing skill, which had been shown upon the screen. This, continued Mr. Garbutt, any smith would pronounce to be impossible of execution. Tijou must have had men under him to correct his more flagrant errors of design. Embossing was, in Mr. Garbutt's opinion, only really effective in ironwork out of doors, where outline was the only thing that told. His own sentiment was against the use of plate work, which would invariably fall away if used in the open air. It was more suitable for use in interiors.

Mr. Maxwell Ayrton seconded the vote of thanks, and expressed himself in entire accord with the remarks of the previous speaker. Although the work of the period chiefly dealt with could claim a certain dexterity of handling, it had lost the simple directness that characterised the earlier work, keeping within the limits of the material, which were rather confined. It was difficult to find more beautiful ironwork than that of the 14th and 15th centuries, in Germany and in Spain. The revival started when, unrestrained by tradition and rules, the smiths themselves appeared to be straining to obtain effects that were entirely foreign to the earlier workmen. The original excellence of treatment, however, was confirmed by a return to the earlier work at a later date.

Mr. Gerald Horsley supported the vote of thanks, and said what struck him as a point of some importance was that the ironwork, described as beginning with Tijou, should only have lasted for two generations. Tijou was succeeded by Robinson, Edwards, Bakewell, and others.

What remained was unpretentious in character, and then only used in the smaller houses. In France it was not so. Ironwork proceeded along with architecture, even as it does to-day. If they followed the architecture from about 1660 down to the present time, they would notice, as in the gates of the Palais de Justice, about 1770, and in many other instances onward, fine ironwork, which suggested derivation from the architecture itself. Charming as the early English ironwork was, it could not be compared with that of the French. True, the English had never had the advantages that the French had enjoyed; when Louis XIV. founded a school for architects in France, England was dependent upon the coming of a Frenchman not so great as Wren.

Mr. Henry Tanner, the chairman, summed up the discussion, and suggested that Mr. Gardner should give a similar paper, being a comparison between English and Spanish ironwork. He submitted that perhaps Shaw had acted as the smith, and Tijou as the designer. Tijou, he thought, must have been a difficult man to get on with, or he would have got more work. He envied him his knack of getting work without giving estimates.

Mr. Gardner, in reply, thanked the audience for their kind reception of his paper, and said that, as it was impossible to condense so large a subject, he had confined himself to a particular time. French influence was largely to be found in English work. In fact, many designs were precisely the same; and it was almost impossible to find in England any designs that had not an exact counterpart in France. It was different with respect to Italy, Germany, and Spain. We borrowed nothing from them, and they borrowed nothing from us. In Germany, continued Mr. Gardiner, nothing finer was to be seen than the Renaissance ironwork. As soon as the low countries became rich, they took up smithing, and smithing of an heroic kind, with the greatest enthusiasm. So, also, was it in Spain. The Spaniards made church grilles which, gradually growing in size, eventually assumed immense proportions, until a height of 90ft. was reached, the work all being done on an anvil, by hand.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION
	NATIONAL MUSEUM OF WALES. The Council desires to receive competitive designs for the erection of a new National Museum at Cardiff. Three premiums are offered of £200, £150, and £100, for second, third, and fourth. The Council have appointed Sir Aston Webb, R.A., Mr. John J. Burnet A.R.S.A., and Mr. Edwin T. Hall, F.R.I.B.A., as Assessors. Particulars and plans of the site will be supplied to competitors on payment of a fee of £2 2s., returnable if all papers are returned within 14 days. Inquiries to be addressed to Dr. Wm. Evans, Hoyle, Director of the Museums, City Hall, Cardiff.
Jan. 31.	PEMBROKE (Co. DUBLIN) LAYING OUT HERBERT PARK. The U.D. Council invite schemes with estimates of cost, for the laying out of above public park, which is about thirty-five statute acres in extent, within their district. A premium of £50, which is to include all expenses, will be paid to the person whose scheme may be selected. All plans, estimates, etc., sent in by the successful competitor to become the property of the Council. The Council will not be liable for any payment to a competitor, other than the above premium to the successful party. A plan of the lands as now existing can be obtained from on and after Monday, 3rd January, 1910. J. C. Manly, Clerk to the Council, Town Hall, Ballsbridge, Pembroke, Co Dublin.
Feb. 1.	OLDHAM, EXTENSION OF THE TOWN HALL. Restricted to Architects practising or residing in the Borough. Premiums of £50, £30 and £20, for the three designs placed 1st, 2nd and 3rd, and a sum of £5 will be paid to all unsuccessful competitors who send in a complete set of plans in accordance with the instructions. Plan of site, with instructions and suggestions for architects obtainable from E. C. Foote, Borough Surveyor, Town Hall, Oldham. Deposit: 21s.
Mar. 1.	GLAZED BRICKWORK DESIGNS AND ESSAYS. A committee of glazed brick manufacturers invite designs for works to be executed in glazed brickwork, also essays as to the advantages to be derived from the use of this material in accordance with conditions to be obtained from J. Johnston Green, 142, Liverpool Road South, Southport. Premiums of 100 guineas, 50 guineas and 25 guineas awarded to designs and essays jointly. Assessor Mr. Max Clarke, F.R.I.B.A., appointed by the President, R.I.B.A.
Mar. 31.	SHEFFIELD: ENDCLIFFE PARK CHURCH. Plans desired for Church for 650, Institute for 150, Primary Department for 95, and Caretaker's Apartments. Premium, not merged in commission, £35. Assessor, Chas. Hadfield, Esq., F.R.I.B.A. Questions until February 10. Delivery on March 31. On receipt of 5s. the Secretary, J. W. Nicholls, 64, Everton Road, Brocco Bank, Sheffield, will furnish conditions and instructions, with plan of site, showing existing buildings, levels and drainage—these not returnable. Deposit returned only to those who send plans.
May 31.	MUNICIPAL OFFICES, KARACHI. The Municipality offer a premium of 7,500 rupees (£500) for the best design, detailed plans and estimates for new Municipal Offices. Cost not to exceed 500,000 rupees, and the style of architecture is left open to the designers. Ferrotype plans of the site and a general arrangement of the floors of the building showing the accommodation to be provided, together with a copy of instructions to architects, will be supplied to intending competitors on application to the Chief Officer and Chief Engineer, Karachi Municipality. A charge of Rs. 5 will be made therefor, which will not be refunded. Each set of drawings must be sent in anonymously, but accompanied by a sealed envelope containing the author's name and address. Each set of drawings and all the documents required, including the sealed envelope, must be securely packed in a wooden box addressed as follows:—The Chief Officer and Chief Engineer, Karachi Municipality, Karachi, India, and forwarded, at the competitor's own risk and charges, in time to reach the Chief Officer on or before the 31st day of May, 1910. It is proposed to apply to Government for permission for one of the chief architects to act as assessor to decide on the design to which the prize shall be awarded. The decision of the assessor will be final and not be open to dispute. The decision of the Municipality will be made within three months of the latest date for submission of designs, and payment of one-half of the premium will be made thereafter to the author of the selected design, the balance to be paid when the further details specified in the instructions to architects have been supplied. On payment of the premium the Municipality will have all rights in the design, with power to erect the building under its own agency, either according to the design selected or with such additions or alterations as it may deem necessary.

Competitions: The Revised Regulations of the R.I.B.A.

To the Editor of THE BUILDERS' JOURNAL

SIR,—The regulations of the R.I.B.A. were revised so lately as the year 1905, and it must seem strange that after an interval of only four years it should be thought necessary to reconsider the rules then adopted on ceremonial motion of the chairman. During these four years there have been no changes in the constitution of the Institute, nor in the status of the profession, and I am quite unaware that there has been of late any notorious indignity put upon competing architects such as would naturally lead to action by the Institute. It would seem, therefore, that the cause of the present ferment lies within the profession itself.

For fifty years and more the wrongs of the competing architect have been a constant grievance in the profession. This grievance has in the past been a real grievance and a bitter one, but if immemorial customs had not established the usage we should be impatient of what would seem unreasonable assaults upon the methods of those who now promote competitions. The habit of resenting a right social usage may become as inveterate as the more common habit of acquiescing in the continuance of an evil one. In this regard the competing architect has been a sick man for a very long time, but from a burly sufferer making the best of a neglected case he has now grown to be a sort of exotic of the sick-room. The habit of being sorry for himself is confirmed in him, so that when the realities of his condition fall short of the standard of ill-health, he is used to it; he imagines causes and, unconsciously, affects symptoms like a confirmed hypochondriac. It is only by such a conception of the state of affairs that the desire of architects that the "requirements" of the promoters should be rigid and binding is understandable, or the idea that promoters who discard the design recommended by the assessor, are guilty of bad faith is intelligible. Both these points, to name no others, are advanced in the proposed new regulations, and I would submit that the first is hostile to the cause of architecture and the interests of architects: and that the second is an indecorous extravagance of language; the first tends to reduce the competitive planner to the level of the solver of jig-saw puzzles, with half the pieces missing, and the second assumes an undertaking on the part of the promoters that they will accept eternal responsibility for any caprice or mental ill-health of the assessor.

The intention of all regulations which have from time to time been framed, has been to secure that so far as is possible the awards in architectural competitions shall be arrived at by a mechanical, impartial sifting out of those designs which do, in fact, technically and in their architecture, best satisfy

the real requirements of the promoters. That I think will be conceded to be a fair statement of the case. Nevertheless, in attempting to enforce a mechanical and impartial adjudication, it is a great mistake, surely, to demand that any design which violates the instructions shall be excluded from competition. It is true that it sometimes happens that competitors who have restrained their convictions and produced commonplace designs strictly in accord with the instructions have found themselves passed over by one who has allowed his enthusiasm to over-ride his ambition for a prize; but the remedy surely lies in *removing altogether the obligation to observe the instructions*, not in starving the inventive powers of the competitors. The merit of any design consists in effective architectural expression being given to a just balance of advantages. A good design is an idea, and any system which allows client or promoter to assert at the outset what his exact detail requirements are, and demands that under no circumstances will he reconsider his requirements, modify or adjust to the needs of the case, is not only destructive to the hopes of architecture, but to all enthusiasm in the designer. The conditions should be drawn much more fully in describing the uses of the building, the commercial interests of the town, and the prejudices and ideas of the promoters. But of restrictions there should be none. If the promoters asked for a council chamber and a design provided even a bear pit, or an operating theatre, no harm would be done; but if the promoters pledged themselves, as they are invited by the regulations to do, to exclude any design that did not show a skylight in the Mayor's parlour, let us say, a great deal of harm would be done, for the requirement is probably quite ill-considered, and is merely included because some pertinacious town councillor has somewhere seen a top-lighted room which he admired. The system of competitions seeks to replace the advice of one man, by the suggestions of many; but if the suggestions of the many are to be judged by restrictions, the system must be a failure—a sort of egg and spoon race.

The strong feeling which has always been aroused when the award of the assessor has not been adopted by the promoters has no doubt been due to the light irresponsibility and coarse motives which have so often marked this event. When the motives are honest and the discard undertaken with serious reluctance, no objection can surely be raised by any reasonable being. What architect with a mind unpoisoned by failure in competitions could raise it? If the promoters have obligations to fill to the competing architects, so also are they under grave obligations to those in whose behalf they act, nor is public indifference to the style of public building a sentiment likely, I think, to commend itself as hopeful for architecture. A public building should properly be one that expresses the time, place, and persons with whom its birth is associated, and not the fashion of building favoured by architects at that date, and any group of architects who would urge promoters of competitions to undertake to accept a style of building they may detest, will fail. As a mere matter of history, in no competition have the promoters ever undertaken to accept the award of the assessor, that is to say, they expressly reserve the right to decline to put up and pay for a building they do not like. I am persuaded that the open competition system is a bad one. Take the system of school prizes—and, of course, I am in the minority, but when I hear as I heard lately a distinguished architect, eminent for his success, who, by competitions, has carried out many buildings, refer to his "many disappointments," I begin to wonder what it is architects expect of competitions. Is it a declaration similar to that of the referee in the story book, who decreed "all have won, and all must have prizes?" For myself, I sympathise with the judge whose only regret was that he could not give a verdict against all parties.

BULKELEY CRESWELL.

The General Election and Architectural Copyright.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I enclose herewith an abstract of the recommendations of the committee (Lord Gorell presiding) appointed in March last by the President of the Board of Trade, to report to the Government as to the legislation necessary to give effect to the revised International Copyright Convention signed at Berlin in November, 1908. The extracts are as follows:—

"As to architecture, the Convention goes beyond British law, which forbids copying plans of a building, but not copying the building itself.

"After due consideration the committee, by a large majority, have come to the conclusion that it is desirable to accept architecture as matter to be protected, both for the sake of uniformity and because it deserves to be protected, and presents no difference in principle from that applicable to the sister arts.

"They further consider that protection should be given against copying buildings, whether by use of plans or otherwise, and against use of drawings or models for other purposes than those authorised and by persons other than those supplied therewith.

"With these exceptions most of the subject matters enumerated in the article are already protected in this country, and the committee recommend its adoption.

"As to the position of copyright in the overseas Dominions, the committee understand that it is proposed to call a conference of Colonial representatives, and it seems to them of the utmost importance that the Colonies should come into line with Great Britain and that, so far as possible, there should be one law throughout the Empire."

It may be that some members are not aware of the result of the deliberations of the committee, but as will be seen they, by a large majority, consider it desirable that architecture should be "protected" not only in the British Isles, but also in our overseas Dominions.

As a matter of practical politics affecting the profession at large, now is the time to obtain the necessary "pledges" in support of architectural copyright, and I venture to make a suggestion and recommendation that individual members of the profession should send a written request to all the Parliamentary candidates in their constituency asking whether, in the event of their being returned to Parliament, they would support a Bill to give effect to the recommendation of the Law of Copyright Committee, 1909, as applied to architecture in particular.

All the answers should be kept until the result of the election is known, and later the replies of the Members of Parliament forwarded to a representative committee of the profession, which could be appointed to deal with the matter.

In the event of legislation affecting the law of architectural copyright being submitted to Parliament, the members supporting the Bill could if necessary be very properly reminded of their promise.

HERBERT SHEPHERD.

120, Kensington Park Road, W.

INDEPENDENT ARBITRATION ESSENTIAL.

At the annual meeting of the Liverpool Law Society, held recently, Mr. George Layton endorsed the President's remarks as to the unwisdom of allowing disputes to be settled bureaucratically. It had always seemed to him to be unfair that a contractor who took a contract from a Corporation, Dock Board, or private individual was obliged to leave any dispute to the arbitration of the engineer of the other side. The consequence had been that many unfair awards had been made. They could hardly expect an official, if he had made a mistake, to give an award against himself (hear, hear). In his opinion, the practice should be made illegal.

THE MEASUREMENT OF ILLUMINATION, DAYLIGHT AND ARTIFICIAL.

WITH SPECIAL REFERENCE TO ANCIENT LIGHT DISPUTES.*

The daylight and artificial illumination of buildings is a matter which the architect is constantly called upon to determine, and to determine in most cases for the whole life of the building. It is difficult to imagine any building where the decisions of the designer with regard to the shape and size of windows and the provision of artificial illuminants are not of the utmost importance. In schools, libraries, hospitals, and workshops the efficiency and sufficiency of the lighting has to be his first consideration, and in very few buildings indeed can he afford to make it a secondary one.

Disproportionate Window Space.

At the same time, rooms which are built with an unduly large proportion of window space can only be warmed in winter with difficulty and at great expense, whilst in summer they are insufferably hot. Even greater care has to be exercised in order to avoid excessive artificial lighting, which is not only expensive but extremely detrimental to the eyesight. The human eye, which will readily adapt itself to very large variations of diffused sunlight, which will read print with equal ease at sunset in December indoors and at noon in June outdoors, is extremely sensitive with regard to artificial illumination, and will be strained and injured by anything outside of a very limited range.

Neglect of the Subject.

One would therefore naturally expect the subject of illumination to have been fully investigated by architects and to receive from students as much attention as the proportions of Greek temples. One would expect that it would be the subject of minute regulations in the London Building Acts and in local by-laws, in the regulations of the Board of Education, and in the Government requirements for the proper lighting of factories and workshops. It would be expected that in the intensely populated towns and cities of England, where land is valued by the square foot and almost by the square inch, and where a light well costs a modest competence in dead rent, that the limiting angles of good, bad, and indifferent lighting would be known exactly. But this is hardly what we do find. What is the information possessed by the average architect upon the subject of windows? He knows that the window space of every room should be at least one-tenth of the floor space—text books written 100 years ago will tell him that—and he probably knows that the same proportion in schools should approximate to one-fifth. But how many could say what proportion of the outside daylight is enjoyed in any room; how many could say what difference would be caused by any given degree of obstruction; or whether the height of the window head makes any difference? How many can define the relative efficiencies of a square foot of glass in a wall and a square foot of glass in a skylight? How many can tell a client what would be the relative amount of light absorbed by or reflected from wall papers of different colours, or by different kinds of glass?

Artificial Lighting.

With regard to artificial light, many architects know that a provision of 30 candle-power per square of 100ft. super of floor area is considered ordinary, that 50 candle-power per square gives bright, and 60 candle-power per square gives brilliant effects. But how many can say at what height from the floor the lights should be placed in order to give these effects, what would be the results at other heights, or what would be the effect of using frosted or tinted globes or shades, and whether the result would be the

*Substance of a paper read by Mr. P. J. Waldram, F.S.I., before The Society of Architects, Jan, 13th.

same with many lights or few? Is it too much to say that the ideas of the average architect upon the subject of illumination are almost as hazy as those of other people? If so, then that is saying a very great deal.

There is no technical literature on the subject. The average architectural school gives perhaps one lecture on window areas to third or fourth year students, whilst the subject of different systems of artificial lighting is ignored as completely as it is in the syllabus and papers of the qualifying examinations. One seldom finds illumination referred to in the technical press, and then only in vague and general terms, and as far as the author is aware no architectural institution has ever suggested the formation of a committee to investigate it and collect information.

The Building Act and local by-laws merely demand a minimum proportion between window and floor area, irrespective of whether such windows are at the bottom of a deep area or overlooking a park. The Regulations of the Board of Education for new schools (1907) are excellent as far as they go, except that they forbid the most efficient possible window, viz., a ceiling light. But they do not go very far, and they are absolutely silent upon the subject of artificial lighting. Details for the approval of the Board are required of sanitary arrangements, ventilation, boundary walls, desks, fireplaces, etc., but artificial lighting is not even mentioned. The requirements of the Home Office with regard to the lighting of workshops is that it should be "adequate," which is, to say the least, a little indefinite.

The Measurement of Light.

The reason for this state of surprising ignorance is not far to seek. Exact knowledge is impossible without measurements and standards; and the measurement of light has been unfortunately confined almost entirely to the measurement of the *intensity* of light sources, whilst the measurement of results, i.e., the general illumination to be derived from arrangements of lamps, has been neglected. Hence, we have ample data as to the candle-power of lamps, but no data at all of the illumination at table height which can be secured by using them. A few weeks ago, the author asked three well-known electrical firms to tender for the wiring of a village hall on the basis of a given illumination at a certain height above the floor. The reply of each one was to the effect that having no data on illumination they were unable to tender. Text books tell us that illumination varies inversely as the square of the distance between the source of illumination and the surface illuminated. So it does in the laboratory, with single lights and blackened walls, but it does not do anything of the kind in the presence of the reflecting surfaces of walls and ceilings.

In the second place the measurement of such an everyday matter as daylight has not been considered worthy of attention. In consequence, the inaccuracies and vagaries of the human eye remain unknown, and it is commonly regarded as an efficient instrument for measuring illumination. As a matter of fact, the impressions received by the eye are no more an accurate criterion of daylight illumination than a landscape photograph is a measure of the acreage of a field. A piece of printed paper upon a table in the centre of a room upon a fine day appears to be illuminated to very much the same extent as when it is held outside the window. But try to photograph in the two positions; outside it may require say 1-5th of a second or less, inside it will probably take 5 minutes. The photographic plate records a difference in the relative illuminations of no less than 1,500 to 1; to the human eye this enormous difference is almost imperceptible. This is only one instance of the utter unreliability of the eye as a measuring instrument. Many others might be cited. For instance, most people would feel insulted if it were suggested that they were unable to estimate the relative brightness of different classes of sky such as:—1, Cloudless; 2, blue predominating; 3, clouds predominating; 4, no blue; 5, overcast.

Photo: Topical.

MESSINA: A YEAR AFTER THE EARTHQUAKE AND FIRE.

This view represents the Swiss Village. The houses are one storey ones and largely built of wood.

But nine people out of ten who were not expert photographers would place them in the wrong order. Very few would expect to find that clouds *increase* illumination, still fewer would believe that the illumination from a cloudy sky is more than double that received from a clear blue.

Effects of Wall Treatment.

Again, the effects of different tints of wall paper on the eye are most extraordinary. Nearly everyone would be favourably impressed with the lighting of a room papered in light pink, and would be extremely liable to consider inadequate that of a room with light buff or pale grey walls. Yet the latter colours reflect nearly four times as much light as pink. Certain wall papers mean a very considerable difference to one's bills for artificial light.

How many people would hold up the Strand Law Courts as an example of daylight lighting? But try and read a piece of fine print at sunset in the witness box or counsel's seat of any of the Courts, and afterwards try it at the same hour in the centre of an ordinary office with large windows; the difference is surprising. The chief reason for this is that the windows are high up in the walls, and the enormously high relative value of high angle light is a matter of which the eye takes little notice, and which is seldom properly recognised. Its effect, however, can be easily studied by darkening different parts of any ordinary window with brown paper screens. The loss of the bottom two or three feet in height will hardly make any difference at all, but shutting off a few inches from the top may reduce the general illumination of a room by 30 to 50 per cent.

It will sometimes be found that high rooms on lower floors with badly restricted horizons are actually *lighter* than low rooms on upper floors with the same proportion of glass to floor area and with absolutely open horizons.

In this connection it might be mentioned that the ordinary North light roof would be very much more efficient if the flatter slopes were turned to the north and glazed. The illumination would be greatly increased and the workmen would not stand in his own light when facing South.

Variations of Daylight Illumination.

The daylight illumination of every room varies by several hundred per cent. from sunrise to noon and from noon to sunset; and it also varies from day to day and from month to month. But the wonderful adjustable iris diaphragm of the eye deliberately stops down all illuminations which are above a common level of efficiency, so that the mind is quite unconscious of these large middle-day excesses of illumination, and may very well remain ignorant of them.

A very little consideration of these facts will show that unaided visual impressions are quite worthless as a criterion of the daylight illumination of any room, and how extremely unlikely it is that different experts, trusting to their eyes alone, will arrive at the same opinion; for it is no exaggeration to say that there are few experts who know how to *mistrust* their own eyes to such a degree as will enable them to form approximately reliable opinions.

Fortunately, however, the daylight illumination of interiors can be measured in spite of its constantly fluctuating character; because the proportion of the outside daylight which any room receives is always a fixed ratio. As sky brilliancy increases and decreases, so does the interior illumination, and in precisely the same proportion, except when the room is lit by the direct rays of the sun or directly reflected rays. If the middle of a room receives 1-1,000th of the outside light at sunrise in December, it receives 1-1,000th at noon in June. This proportion is also the same in a scale model of the room as in the room itself. All that is required is a photometer with a large adjustable range and which will record not candle-power but illumination in candle-feet, viz., degrees of illumination equivalent to so many standard candles at a distance of one foot.

Light Measurement a Simple Matter.

The chief object of this paper is to show that the measurement both of artificial and daylight illumination is such a very simple matter, requiring neither special skill nor expensive apparatus, that it ought to be largely undertaken by architects. The photometry of lamps and other light sources demands very delicate and expensive apparatus, specially constructed laboratories, and the exercise of technical and mathematical ability of no mean order. But the photometry of lamps is a matter for the engineer and not for the architect: he is concerned with the results, not the means. The photometry of illumination, both daylight and artificial, can be performed with instruments of about the same size, weight, and cost as a good hand camera, and demands neither technical skill nor mathematical knowledge.

The principle of illumination photometers is to compare the illumination which falls upon a card outside the instrument with the light of a standard electric lamp inside, and

viewed through a slot in the same card. The light of the standard lamp is graduated by turning a milled head at the side of the instrument until the illumination of the slot is equal to that of the rest of the card. The same operation turns an index needle on a dial which automatically indicates the degree of illumination in the slot. The difficulty of balancing lights of different colours is in most instruments met by passing the light through a rapidly rotating section. The resulting flicker is, however, not a little trying to the eyes, and the author prefers the well-known Preece-Trotter type, in which the difficulty is overcome by using slotted cards of different standard tints.

[This method was explained with the help of diagrams.]

The following are a few examples of inside and unrestricted outside illumination :—

Proportion of Unrestricted Outside Illumination Received by Interiors of Buildings.

Obstructions to Light.

In cases where the obstruction of the visible horizon has already taken place, the proportion of light still remaining can be compared with that of other rooms in the neighbourhood; but the more customary problem is to estimate the future damage of a proposed obstruction. This can be ascertained in three ways.

(1) By erecting the proposed obstruction in the form of temporary screens and noting their effect on the percentage of light enjoyed. (2) By reproducing the room and its aspect in a scale model and similarly noting the effect. (3) By deducing the damage from known and recognised data of the difference caused by any given degree of obstruction.

The first two methods are comparatively simple, and they are the only ways open to us at the present time; but if we only had the data referred to in (3) the trouble, anxiety, and needless expense of ancient light disputes might be avoided altogether, and at the same time one of the greatest difficulties connected with town building would become a matter of simple calculation.

Finally, we have to consider what is the real effect of any given obstruction. Over the greater part of the working day it is negligible, for if a room be lit at all at sunrise and sunset, then it has a very large excess between those hours. It may suffer æsthetically, and in rental value, from loss of prospect; but prospect is not as easement.

Seasonable Varieties.

The real loss, as regards reading, writing, and industrial occupations, is that more artificial light will be required in the morning and evening. The extent of this loss can only be exactly arrived at if the average of increase and decrease of outside daylight be known. There is need for exact and authoritative data, but approximately this may be put at a rise or fall of about 1,000 candle-feet in 45 minutes on clear days in June, and in 180 minutes in average weather in December. In other words, at a point in a room enjoying 1-1000th of the outside light the illumination would increase and diminish at the average rate throughout the year of 1 candle-foot per 120 minutes. But a room only enjoying half that proportion would require twice as long to acquire a working light in the morning, and would lose it so much sooner in the evening.

A rough approximation of a standard well-lit room would be one enjoying an average of 1 candle-foot (i.e., a fair reading light), at half-an-hour after sunrise and at sunset on a clear day, which is given by a proportion of about 1-1000th of the outside illumination. Fig. 3 shows approximately the number of minutes of artificial illumination per full *working* day of sunrise to sunset, which would be necessitated in such a room by any given degree of damage. The cost of this can be readily ascertained and capitalised.

The great present-day need is that architects should take an active and intelligent interest in illumination. They can at least insist that gas and electric sub-contractors should guarantee a given illumination at table height of candle-feet. The demand will soon create the supply, and instruments for testing the results are neither expensive nor difficult to use. But above all, we need workers who will record data and results. Architects, and architects alone, can do this satisfactorily, and their labours would benefit not only their own profession, but the whole of the working community.

Societies' Reports.

Ulster Society of Architects.

At the annual meeting of the Ulster Society of Architects, a copy was submitted of a memorial forwarded to the authorities of Queen's University, Belfast, in reference to the teaching of architecture as a fine art. The question of the erection of new buildings for the Queen's University is also an important one; and it was stated that the Council approached the Senate by letter and deputation to obtain, if possible, some assurance that precautions will be taken that not only shall the buildings be designed so as to be a credit to the city and province, but also that no qualified architects, especially members of the society, should be debarred from an opportunity, by competition, of obtaining the appointment of architect for these buildings.

The Council had had attention drawn again to the fact that surveyors and others are being employed to do architects' work, to the serious loss of the professional architect.

The scrutineers having reported the result of the ballot, the following were declared duly elected, viz :—As honorary member, the Right Hon. Robert Young, P.C.; as associates, Messrs. R. Steven Boag, Belfast, and J. M. C. Robinson, Derry. The following is the result of the ballot for officers and Council for 1910, viz. :—President, Mr. R. M. Young; vice-president, Mr. H. Seaver; hon. treasurer, Mr. T. Houston; hon. secretary, Mr. J. St. J. Phillips; members of Council, Messrs. J. J. M'Donnell, W. J. Gilliland, and N. Fitzsimmons; associate members of Council, Messrs. T. W. Henry and H. Lamont; hon. auditors, Messrs. J. A. Hanna and Vincent Craig.

The Institution of Municipal Engineers.

At a meeting of the Council of the Institution held at 39, Victoria Street, London, S.W., at the end of last month, 37 applicants were elected to membership and five to studentship. The roll of the Institution now stands at 679 members and 96 students, making a total of 775. The secretary was instructed to send to the National Association of Local Government officers a copy of the following resolution, which was passed at a meeting of the Northern District of the Institution, held on December 18th: "That the Council of the Institution be asked to communicate with the N.A.L.G.O. asking them to send a letter to each candidate for Parliament at the forthcoming election, enquiring whether he is prepared to vote for a bill giving to local government officers superannuation on similar lines to that now enjoyed by poor law officers." It was decided that arrangements be made to hold the next General Meeting of the Institution, if possible, in Manchester in February. It was decided that any member of the Institution be allowed to attend Council meetings, and that any member so attending may, with the permission of the acting chairman, address the Council on any matter under consideration. It was resolved that the suggestions made at the joint meeting of the Council and hon. district secretaries on November 27th, together with the observations since received on these suggestions, be referred to a committee. It was resolved that a committee, to be known as the Revision of By-laws Committee, be appointed to prepare new draft by-laws. Copies of a draft report of the Science Standing Committee of the Concrete Institute were received, and the secretary was instructed to circulate the copies among the members of the Council. It was resolved, in pursuance of the resolution carried at the last General Meeting, "That a Committee, to be known as the Examination Committee, be appointed."

BELFAST IMPROVEMENT SCHEME.

The Corporation of Belfast has adopted an important improvement scheme to sweep many of the insanitary areas away and devote the ground thus cleared to open spaces, new and wider streets and modern houses. One result of the scheme will be the abolition of what is known in Belfast as the double tenancy system, under which an ordinary house is divided into two, the upper and lower portions being occupied by different tenants. The ground floor only, however, has the necessary water supply and sanitary accommodation. The scheme owes its origin to a report of Dr. Baillie, medical officer of health for the city, who gave it is his opinion that the narrowness, closeness, and bad arrangement of certain streets and houses and the want of light, air, and ventilation in the areas injured the health of the inhabitants. It is proposed to deal with eight areas of varying sizes, in different parts of the city. The localities scheduled contain 1,160 houses, with accomodation for about 6,000 persons under normal conditions, but as many of the dwellings are at present unoccupied, not more than between 3,000 and 4,000 persons will be displaced. After the existing houses have been cleared away the vacant ground will be devoted to the making of new streets, mostly between 40 and 45ft. wide, the widening of existing thoroughfares, the provision of more open spaces, and the laying out of playgrounds for schools. Afterwards a start will be made with the erection of model houses to accommodate the tenants displaced. The sum of £20,000 has been earmarked for the purpose. The houses will consist of two rooms; each will have a complete water supply and sanitary conveniences, while the rents—2s. a week—will be low enough to suit the purse of the poorest labourer. The remainder of the ground suitable for such houses will be let to builders on the understanding that they erect houses of the same type.

The cost of the undertaking has been set out as follows :—

Land and buildings	£81,855 5 0
Making, sewering, and paving streets	5,387 0 0
Incidentals and contingencies	9,180 0 0
Proposed model dwellings ...	20,000 0 0
	£116,422 5 0

It is calculated, however, that this cost will eventually be reduced by over £66,000, by the estimated value of building ground, capitalised ground rents, and other rents to be received.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional, or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The Editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned, but enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies, or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s. made payable to Technical Journals, Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable; and it must be understood that both question and reply will, as a rule, be published in these columns

Planning a Jam Factory.

A Regular Subscriber (Biggleswade) writes: "Kindly tell me the requirements of a jam factory—planning, accommodation, plant, cost, etc. Perhaps there are books on the subject. However, I am only wanting a general idea at present, and will be very glad if you can kindly oblige me at your early convenience."

—Books that may assist are Marks' "Principles of Planning" (Batsford 8s. 6d. net), Thwaite's "Factories, Workshops, and Warehouses" ("Builders' Journal" Office, 9s.). There is also one entitled "Factories, their Planning and Arrangement," by an American author, which may be obtained through Chapman and Hall. The best way, however, to learn the requirements would be to get an introduction to see over a jam factory.

Henry Adams.

Combined Drainage.

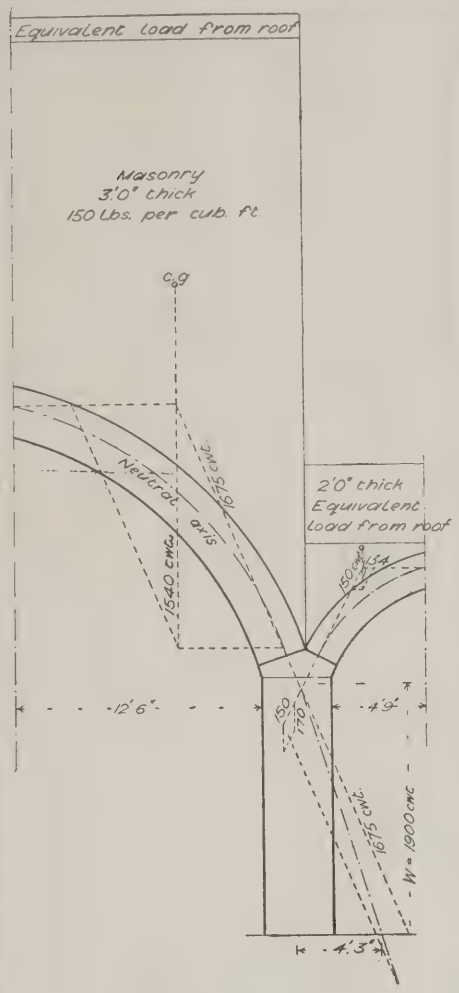
A. C. A. (Leyton) writes: "The drains of six houses, built in three blocks of two each, were constructed in 1854 by one main drain or sewer, "B" carried a cesspool at one end of the row, each house having a short connecting drain to the main drain or sewer. The cesspool was done away with when the sewer in the road was constructed a few years ago, and the main drain connected up to the new sewer. The owners were charged by the Urban District Council for the sewer in the road, and the road being made up was then taken over by the U.D. Council. The question is whether this main drain is not a sewer and therefore repairable by the U.D. Council."

[To this question we replied that we were of opinion that the drainage system shown from the point where it receives the sewage of the second house (No. 5), is a sewer, and repairable by the local authority. *Travis v. Uttley* (1894), 1 Q.B. 233.—Editor.]

"A. C. A." then writes as follows:—"I hear the U.D. Council say they know all about *Travis v. Uttley*, 1894, but that they rely on *Wood Green U.D.C. v. Joseph*, decided in the House of Lords, July 24th, 1908, where, although the decision was against the Council, yet it cleared up many uncertain points, and they say they are satisfied they can recover under it.

"(1) Does this case alter your opinion, or have any legal decisions been given since this second case which would modify the effect of the *Travis v. Uttley*, or which could make such a combined system as ours a private drain and not a public sewer?

"(2) Regarding the branch drains which the Council have relaid (the cost of which is claimed from the owners), the Council having relaid the main drain or sewer a foot or two lower than it was originally laid, must necessarily have relaid part, at any rate, of the branch drains in order to connect with new main drain or sewer. In these circumstances should not the branches be paid for by the Council in part, if not in whole?



"(3) I hear the Council will apportion the cost of the new sewer or main drain on the principle of an equal sixth to each of the six houses; but as No. 1 has twice the width of garden, and therefore twice the length of drain, and all the houses vary in frontage, would such an apportionment be legal? Must not the charge be made according to the actual length of pipe used and work done for each house? Can you refer me to any legal decision on this point?"

(1) Having regard to the fact—which was not made clear in the former query—that the six houses in question belong to different owners, the case would seem to be governed by S. 19 of the Public Health Acts Amendment Act, 1890. That section enables the local authority to call upon the owners to repair a "single private drain." In my view, and upon the authority of *Wood Green U.D.C. v. Joseph*, all the owners will be liable to contribute. But suppose one man owns 1 and 2, that part of the "Sewer or Drain B" which is at the back of his house, will be a sewer, and as such maintainable and repairable by the local authority.

(2) I should think, in the absence of authority, that if the local authority alter the level of their sewer, they cannot charge the persons liable for the maintenance of the branch drain with the cost of the alterations.

(3) I can find no case in which any principle was enunciated as to the proportions in which the liability should be divided up. It would seem, however, to be fairly clear that the matter ought to be determined by length of frontage.

B.

ILLUSTRATING REPLY TO CHURCH (SUNDERLAND.)

Cement Rendered Plinth to Match Stone.

H. J. C. (London, W.C.), writes: "It is proposed to render certain brick portions at the base of a red brick and stone-faced building occupying an important position in the City, so as to give the building the appearance of having a continuous stone base. The rendering will be coloured to match the adjoining work as nearly as possible, but it is thought desirable to cover the whole of the existing stone work and the rendered portions above referred to with some permanent solution to conceal any difference in colour which may be noticeable. Certain portions of the stone cornices, etc., to the upper part of the building are worn and decayed; these will be brought forward with cement and sand and washed over with the same solution. Can you recommend a suitable solution?"

—Such solutions as fluate (Bath Stone Firms, Ltd.), are used to prevent the decay of stone by rendering it waterproof. Cement rendering to form a plinth on a city building is useless unless the building is protected by its position from rough usage and from traffic. A thin wash of Portland cement is sometimes put over a stone front after brushing down to give a uniform tint, and this might be tried in the present case.

Henry Adams.

Stability of Arches to Support Tower.

Church (Sunderland), writes: "In the design for a lantern tower (not reproduced) the arches are struck from centres which will be about 6ft. 6ins. below their springing, and as so many architects seem to place tie-rods across these arches (e.g., Mr. Norman Shaw in All Saints' Church, Lee), and as they obviously cannot think them any gain from an æsthetic standpoint, they apparently must consider them necessary from a structural point of view. It appears to us that in one case the nave, transept, and choir should form sufficient abutments, but if there is the least risk we contemplate introducing steel joists in the thickness of the walls above the arches. We should be glad to know whether, in the opinion of your expert, these joists (which are indicated in blue on diagram) are necessary, and if so, of what size they should be. The tower, as will be seen, is a low one, and we may say that, as the church is for a colliery district, we intend instead of laying the ordinary foundation, to build on a raft of reinforced concrete."

—The elevation of one pier as proposed with the load coming on to it in one direction, is shown in accompanying illustration, assuming no strengthening by joists, etc. The weight of the pier is first combined with the thrust from smaller arch, and the result thus found combined with the thrust from the main arch giving a final resultant cutting the base at 4ft. 3ins. from centre of gravity of base joint. Then

$$\frac{W}{A}\pm\frac{M}{Z}=\frac{1900}{9}\pm\frac{1900\times4{\cdot}25}{\frac{1}{6}(3\times3^2)}=211\pm1794=$$

2,005 cwt. or 100.25 tons per sq. ft. compression, and 1,583 cwt. or 79.15 tons per sq. ft. tension. In addition to this there would be a thrust of the same amount coming from the arch at right angles to the one taken in the calculations, so that the piers are totally inadequate without some method of decreasing the thrust of the arches. If rolled steel joists are inserted as suggested, the required section of the piers may be found approximately as follows. The total dead load will be, say, 1,540+1,725+134+134=3,533 cwt. or 176.6 tons, and at 15 tons per sq. ft. the area required $=\frac{176{\cdot}6}{15}=$ say 12 sq. ft., requiring the piers to project another foot in the direction of the 25ft. span arches, which will be reduced in span by 2ft., and in the direction of the 28ft. span arches the piers should be increased 18ins. and the span reduced accordingly. It is impossible to say exactly what load the joists will have to carry, being built in the wall like this, but it may be assumed that they will have to carry 52 tons distributed over a clear span of 23ft., requiring two (B.S.B. 28) 18ins. by 7ins. by 75lbs. rolled steel joists, and the same size will do for the other direction.

Henry Adams.

Highway Encroachment.

"CHESHIRE" (CREWE), writes: "In the case of land abutting upon a public highway and divided therefrom by (A) an ordinary thorn hedge, and cop (B) the same with a ditch on the highway side of the hedge; should the area be calculated to the root of the hedge or to the bottom of the cop and 4 feet from the root of the hedge respectively? If the latter be correct, could an owner under conditions (B) remove the old hedge and erect a new fence 4 feet from the root of the hedge, assuming that he properly piped the ditch, and that the new fence did not project beyond the 4 feet from the root of the hedge?"

—In the circumstances detailed, it is clear that the width of the highway is defined by measurement between the hedges on either side. It was laid down in 1862 that: "In the case of an ordinary highway, although it may be of varying and unequal width, running between fences, one on each side, the right of passage or way prima facie, and unless there be evidence to the contrary, extends to the whole space between the fences, and the public are entitled to the use of the entire of it as a highway, and are not confined to the part which may be metalled or kept in order." (*R.* v. *United Kingdom Electric Telegraph Co.*, 1862, 31 L.J.M.C., 166.) That being the width of the highway, it is clear that to erect a fence in the proposed place 4 feet nearer the metalled road, would have to encroach on the highway, and would have to commit an act which might be restained by the highway authority. B.

Liability for Smoke Nuisance.

J.E.C. (LONDON, W.) writes: "I have taken a house which has a wash-house in the garden at the rear. This wash-house with chimney projects about 10ft. beyond the next door house, and the chimney runs up to the level of the first floor window next door, being about 10ft. away from that window. When the copper fire is lighted the smoke goes into the window and causes the neighbours annoyance. Our wash-house and chimney were built some 20 years before the house next door. Can my neighbours compel me to remove or extend the chimney?"

—It is not stated whether the 'copper' chimney was built before the neighbour came to occupy his house. It does not much matter, however, for it is no answer to a claim for nuisance that the plaintiff came to an existing nuisance with knowledge of its existence (*Tipping* v. *St. Helens Smelting Co.*, L.R., 1 ch., 66). In that case the plaintiff bought land, knowing there was a smelting works on land near it, recovered damages in an action at law for the injury done to his land by the smoke of the works, and then filed a bill for an injunction which was granted. The only chance of resisting a claim for damages or an injunction rests on prescription. If it could be shown that this "copper" chimney had been used without interruption for 20 years, its owner might have a prescriptive right. In *Crump* v. *Lambert*, 1867, L.R., 3 Eq., 413, Lord Romilly said: "It is true that by lapse of time if the owner of the adjoining tenement . . . has not resisted for a period of twenty years, then the owner of the dominant tenement has acquired the right to discharge the . . . smoke . . from his tenement over the tenement of his neighbour." A solicitor should be consulted without delay. B.

Public or Private Road.

JUSTICE (SKIPTON) writes:—Some two years ago the streets A and B shown on sketch [not reproduced], were scheduled to be made up under the Private Street Works Act, 1892. On receiving the provisional apportionment the owners laid an objection on the ground of excessive cost, and a deputation met the Council. The latter promised a reduction of the cost and a definite understanding. An owner in street B (who, by the way, is clerk to a highway authority), claimed that these streets were repairable by the authority on the ground that both streets were formed and opened to the public prior to the year 1835. He saw the town clerk on the matter, and the matter lapsed for some six months. Then the Council's surveyor died, and on the appointment of his successor the question again came up. For some reason or other the street B, which was a much worse state than A, was left undone, and no provisional apportionments were sent out for street A, which has been executed alone. Can you give me any information respecting the liability of authorities to repair streets opened to the public prior to 1835. The final apportionments, I may add, were much higher than the provisional ones."

—Without many additional particulars, it is impossible to say whether the highway authority are within their rights or not. It is true that a way which was a highway repairable by the inhabitants prior to 1835 could not now be made up at the expense of the frontagers: but the question is one of fact. B.

Joint Ownership Possession.

F. O. J. (BATH) writes: "A property consisting of house and garden is held by two parties jointly under a will; one of the joint shareholders is in occupation of the demise, but there is not an agreement, and no rent has been paid since the will was proved in 1907. (a) What power has the non-occupying joint shareholder to compel the occupying shareholder to quit the premises? (b) If the occupying joint shareholder remains on the premises, how to determine the rent?"

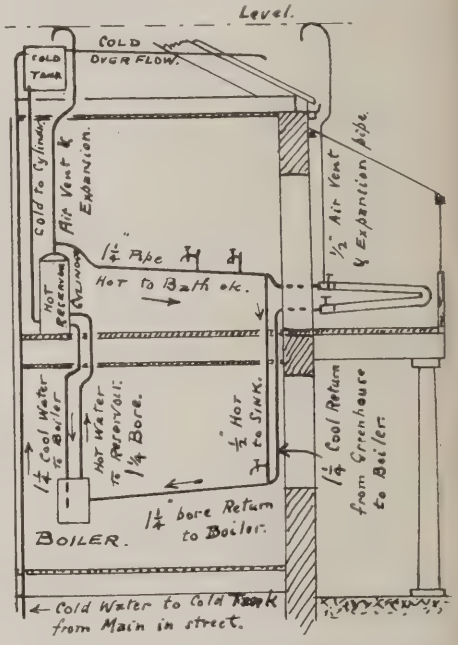
—Highly technical points of law are involved in this query. Before replying fully, it would be necessary to know (1) the terms of the will; (2) whether there are any trustees; (3) whether the house and property is owned in fee, or is merely the residence of a lease. The use of the word "demise" makes it appear that it is a lease. Assuming this to be the case, it is clear that one joint tenant cannot oust the other. They each are entitled to possession "*per my et per tout*" (to use an old legal phrase), and the one who is in possession may stay there. An old Act of Parliament, however (4 and 5, Anne c., 16), provides that actions of account may be brought and maintained by one joint tenant or tenant in common against another as bailiff for receiving more than comes to his just share and proportion. There is, however, no relationship of trust or agency in one co-owner of a property towards the other, and where one collects the rents of the whole he does so not in the capacity of agent, but of owner (*Kennedy* v. *De Trafford*, 1897, A.C., 180). B.

Proposed Alteration to Bridge.

A. E. W. (SALOP) writes: "I was called in to report upon and give an approximate cost of repairing a defective bridge built quite recently on an estate. I also enclose two drawings [not reproduced]. The one marked (1) is the bridge as at present; the arch is giving way, but does not seem to push the sides out, and the other marked (2) is what I suggested by way of remedy. With regard to the narrowing of the span, this will not affect the flow of water, as I am informed that the same is never more than 18ins. deep, and at present it is only about 9ins. Could you also give me a rough idea of what the cost should be? (the old blue bricks would, of course, come in again); also any other information with regard to the construction of some."

—The proposed alteration of bridge by thickening the piers on the inside and reducing the span would probably be advantageous, but of course no definite opinion can be given without knowing all the circumstances and making a personal inspection. Three half-brick rings would be better than one-half brick and one 9in. specially moulded. A key stone improves the appearance, but is not essential. HENRY ADAMS.

Exterminating Beetles.



READER (HULL) writes: "Is there a means of getting rid of bettles under wood floors, all powders having failed? The cause of their existence is believed to be due to a leak in the back boiler, which has rotted a portion of the boarding. This has all been renewed, also additional air bricks have been placed all round the house."

—I fear that there is little to be done in such a case if all possible holes and crannies have been filled up. If small hollow canes (or pieces of elder stems) are strewn about the beetles will creep into them and may be destroyed very easily, but it is a work of "patience and perseverance." F.S.I.

Heating Greenhouse from Kitchen Boiler.

H. S. (ROCHDALE) writes:—"In a new house the kitchen will contain the usual kitchen grate with boiler for supplying hot water to sink and bath-room. In the back-yard over the kitchen window a small greenhouse is to be built. Can this greenhouse be heated from the hot water supply in the house, and if so, can you give me any particulars of the heating?"

—Yes. More fuel will be needed, of course, and you may have to use coke on frosty nights. The piping needed would be 35 to 40 lineal ft. of cast iron pipe, 4in. bore, to each 1,000 cubic ft. of space, with a separate boiler, fired to suit the weather. In your case the boiler is not fired to suit the weather, but to suit cooking, washing, and baths; so the warmth may vary more than prize-winning blooms may stand.

ILLUSTRATING REPLY TO H. S (ROCHDALE).

You will get the best results by a separate return pipe from the greenhouse to the boiler, with a valve on it. The flow pipe may be from a T-piece on the main flow from the boiler to the hot-water tank in the bath-room, but if possible, it should be a continuation of the hot-water pipe from bath-room to scullery. If this pipe be led on from the scullery sink to the return pipe from greenhouse to boiler, you will then have a complete circulation at little cost, and be able to draw hot-water almost as soon as a tap be opened. The accompanying sketch shows the pipes needed. A valve may be needed on the pipe between the scullery sink and the return pipe to the boiler from the greenhouse, though it may not be necessary. Valves to flow and to return pipes are needed in the greenhouse. The expansion and air-vent pipe to the greenhouse pipes must be led to a greater height than the top of the cold-water reservoir that supplies the boiler, and this will mean that the expansion tank at the pipe ends, usual in small greenhouses with their own boilers, will not be needed; it will overflow unless its lid be made secure and water-tight.

Buildings to Measure near Hereford or Worcester.

"Gothic" (South Wales) writes: "(1) hat good work is there to measure or study r the Inter. R.I.B.A. Exam. in or near ereford or Worcester? (2) Do you know of y book or books on measuring work for e above exams.?

(1) Querist will find ample scope for udy in the cathedral churches at Hereford id Worcester, notwithstanding the destruc-ve "restorations" which they have severally ndergone. At Hereford the Cantilupe rine in the north transept, or the adjoining mb of Bishop D'Acquablanca, would be cellent subjects for measured drawings. he beautiful Perpendicular north porch of ishop Booth would also be a good, though ther ambitious, subject. At Worcester a ortion of the wall-arcade in the south-east ansept, or of Prince Arthur's chantry, ight be measured; or a window from the ined Guesten Hall. Both Leominster and edbury churches contain some very fine eometrical windows with ballflower orna-ent, which would make excellent subjects. ewkesbury Abbey should also certainly be isited, if possible.

(2) "Architectural Drawing" by R. Phené piers (Cassell and Co.) contains some use-ul directions as to the preparation of neasured drawings of architecture. A help-ul paper on the subject by Mr. L. M. Gotch, Institute Medallist for measured rawings, is given in the May number of ast year's Architectural Association journal, which could be obtained from the offices of he A.A., 18, Tufton Street, Westminster, rice 7d., post free. G

R.I.B.A. Prize Awards.

The following awards were announced at the Institute meeting on Monday last.

Institute Silver Medal and 25 Guineas (Essays).

"Domus et Hortus," J. A. O. Allan, Aberdeen. Certificate of Hon. Mention: "Rez de Chaussée," C. J. Nixon Horsfield, Westminster.

Institute Silver Medal and 10 Guineas (Drawings).

"Roma," James Whitelaw, London, N.W. Hon. Mention, "Francois Mansart," Cyril A. Farey, London, N.W.; "Adige," Herbert J. Rowse, Liverpool.

Soane Medallion and £100 for Design for Shakespeare Memorial Theatre.

"Mirth," Alec. G. Horsnell, Chelsea. Hon. Mention, "Horseshoe," Adrian Berrington, Chelsea.

Owen Jones Studentship, Certificate and £100.

W. O. Miller. Hon. mention, H. R. Wilkinson.

Tite Prize, Certificate and £30.

"Jupiter," William A. Robb, Glasgow. Hon. mention, "Comprised Within," Anthony R. Barker, London, W.; "Tomahawk," William Friskin, Pollokshields.

Grissell Gold Medal and £10 10s. for Design and Construction.

"Fra Angelico," Charles Percival Walgate, London, W.

Arthur Cates Prize, 40 Guineas.

C. D. Carus-Wilson.

Godwin Bursary, Silver Medal and £65.

W. Milburn, jun.

Ashpitel Prize. 10 Guineas.

William John Roberts, Manchester.

Pugin Studentship, Silver Medal and £40.

H. Hubert Fraser, Hon. mention, D. J. Chisholm; J. B. Cowper.

Hackness Hall, the seat of Lord Derwent, about six miles from Scarborough, was the scene of a very disastrous fire on Sunday last, damage being done to the amount of many thousands of pounds. The fire commenced at the top of the building and burnt down to the cellars.

THE NEW ACADEMICIAN.

Mr. Ernest George, who has just been elected an Associate of the Royal Academy, was born on June 13th, 1839, and was educated at Brighton. He won the Royal Academy Gold Medal for architecture in 1859, and the Royal Gold Medal of the Royal Institute of British Architects in 1896, and was elected President of this body in 1908. He studied at the Academy Schools, and began practice with Mr. T. Vaughan. His works include "Stoodleigh Court, Dorset," "Collingham Gardens, South Kensington," "Church of St. Andrew's, Streatham," "Harrington Gardens, Mount Street," and a "Villa at Antibes, France." As an etcher he has pibliished "Etchings on the Moselle," etc.

Our Plate.

L.C.C. School of Building Extension.

The buildings completed in the autumn of last year form an extension to the L.C.C. school of building, Brixton, S.W., which was opened in 1904, for the purpose of instruction in building and the allied trades.

The position of the extension on the vacant land available, was determined by the proximity to the railway on the north side and to the dwelling-houses in Ferndale Road on the south side. These factors lead to placing the lecture hall farthest from the railway and adjoining the Ferndale Road Houses, where, by reason of the comparatively low roof, interference with rights of light of these houses would be avoided.

The principal portion of the building is arranged in a block parallel to the railway, and double windows are provided in those rooms where quiet is essential.

Laboratory and workshop accommodation (in accordance with schedules prepared by the officers of the Education Department), is provided chiefly on the north side of the main corridor.

The extension (about 198ft. long) contains two staircases extending the whole height of the building, providing alternative means of escape in case of fire.

On the ground floor are placed the lecture hall, arranged to seat 200 persons, rooms for the principal, principal's assistant, and clerks, mechanical and physical laboratories, smiths' shop, men's cloak-room, and lavatories.

On the first floor are the chemical laboratory, demonstration class-room, stone-carving room, a workshop, and the students' common-room and library; also cloakroom accommodation for women.

On the second floor are classrooms for wood-carving and ornamental leadwork, a painters' shop, two classrooms, teachers' common-rooms, and lavatory accommodation for men.

On the third floor are architectural drawing office, architectural classroom, ornament room, modelling room, and figure room, the three last-mentioned being provided with north light.

The buildings, externally, are faced with yellow stock bricks, and the roof is covered with green slates.

The walls of the corridors, staircases, and laboratories are lined to the height of about 4ft. with brown salt glazed bricks, and above this they are plastered and finished with distemper. The walls of other classrooms generally are plastered and distempered. The floors of the classrooms are laid with wood blocks, and those of the corridors with red tiles.

The details of the fittings have been considered in conjunction with the education officers.

An external hoist has been provided in the yard for conveyance of clay, plaster, etc., to and from the upper floors.

The building is mechanically ventilated by means of electrically driven fans placed in the roof.

The building has been designed by Mr. W. E. Riley, Superintending Architect to the London County Council, without reference to any particular style, the object being to secure a plain substantial structure expressive of its use.

The contract amount for the building work is £24,996, and the Council sanctioned a sum of £2,000 for the equipment.

Our plate shows views of (1) the north front from the railway, (2) the lecture hall, and (3) the chemical laboratory.

REINFORCED CONCRETE CATTLE MANGERS AND STALLS AT BURDEROP PARK, SWINDON.
This view shows a new use for this ubiquitous material, which demonstrated its value as a fire-resisting material, as will be seen from the view below. Indented Bar reinforcement was used.

WHAT IS ARTISTIC CRAFTSMANSHIP?

The first of the second series of lectures on the arts connected with building was given at the Carpenters' Hall on Wednesday evening, the lecturer being Professor Beresford Pite. What do we mean by artistic craftsmanship? Is there a distinction between art and artistic craftsmanship? Is there any difference between such a matter of pure sentiment as things dubbed artistic, and matter of fact practical craftsmanship? Is not craftsmanship one thing, and anything artistic very much opposed to it? Artistic craftsmanship is a virtue which doubtless has a past to contend with, but that it will rise from its dead ashes to a nobler usefulness, we have little doubt. We ask the question, the lecturer continued, what is artistic craftsmanship? Does it not mean work well done by one who understands his trade? Work done by someone who knows nothing much of other learning, but knows what he can do with certain instruments? such, for example, as Indian surface carving on ivory. Is this artistic craftsmanship? We must assume that the man has honestly done his level best, and that the work is sound and true.

Granted the best craftsmanship, is the result necessarily artistic? If not, then what on earth do we mean? If the poor fellow has done his best, are his labours inferior, is his result less worthy, because of some standard by which we judge him? In such a difficulty how useful are the building crafts to us. Among the building crafts there are many instances in which the honest practical work of which we have spoken is all that is required. For instance, in the framing of partition walls, and the unseen framing of roofs, such work would not be improved by having smooth edges and carefully wrought parts. Drains also suggest craftsmanship, but not artistic because hidden from view. The plumber has been successful in asserting himself vigorously with his wiped joints. Here his craftsmanship is very much in evidence. Why not artistic? This sort of plumbing is of course not "ornamental leadwork." We must differentiate between the two and class this as unornamental, unartistic leadwork. A splendid series of slides were next shown illustrating the lecturer's points. Commencing with Stonehenge, which he said was an example of craftmanship pure and simple, as to its artistic qualities, we will hold our breath. As far as workmanship is concerned, great skill was involved in pilling those huge lintels on the posts. Next we were shown the ruins of the temple at Paestum. Here he said we have the same lintels and the same posts, with a huge entablature and simple expressive columns with large abacus caps. Here there has entered into the mind of the craftsman nothing more than the constructive element. The distance between the columns was arrived at by nothing more than the capacity of the lintel to bridge the span. The Parthenon at Athens showed the same structural difficulty, the same problem for the craftsmen. The lecturer ventured to suggest that if the Greeks had had steel girders, they would have been delighted to span the portico of the Parthenon from angle to angle with a single girder after the manner of those employed in the new Post Office building in Newgate Street. The art of architecture has been defined as refinement in building, and no better example of this can be found than the way in which the Greeks for century after century gradually increased the refinement of their work. The Erectheion was next shown, and the lecturer pointed out the refinements in the carving of the capital, base, and the shaping of the fluting, each of which was imposed on the craftsman, not from outside, but as a tradition, and from the possibilities of his own hand and his own tools. Speaking of the Caryatid portico, he remarked that there is an element here not in the portico or in the Parthenon. No fad of the craftsman could account for the six elegant ladies supporting the portico. Here an element of poetry has come in, something alien to the material. The spirit of art has entered in. Art is leading and craft following. Part of the beautiful frieze from the Temple of Apollo was shown and compared with one from a sarcophagus at Syracuse, as showing the craftsmanship of the Greeks in setting their sculpture in the frieze as a composition, while in the later example (about 8th or 9th century) the figures are ranged in a row without any composition. Next the history of the Corinthian capital was traced, and the origin of its name (taken from Corinth, which was the seat of bronze worker), which indicates its bronze origin. Passing to another branch we were shown a scene on the Tiber with an old three-ringed masonry arch in the foreground, from which, the lecturer remarked, springs all the craftsmanship of the architectural arch. Then followed a few simple examples of unaffected beauty, having the qualities described at the outset, and where an honest attempt to do the best has resulted in artistic effects. The narthex of the church of San Lorenzo, with its simple row of columns decorated with a spiral instead of vertical flutings, the Cathedral of Torcello having the same directness of expression and absence of ornament, an example of sober craftsmanship attaining artistic quality on account of its simplicity and directness. Next some interiors were shown, and the lecturer expressed an opinion that the original builders were unaware that their buildings were beautiful at all. In the case of the cathedral at Monreale, in Sicily, the element of the art of beauty was confined to the capitals. All the rest was plain, honest unadorned brickwork, until handed over to the mosaic workers. In the case of another and earlier building, San Vitale, at Ravenna, the architectural interest is entirely secondary to the decorative interest. A pulpit at San Lorenzo also illustrated in a marked degree the simplicity and directness of the craftsman's methods. Turning homewards a stone Saxon cross was shown, carved at a time when there was no artistic style in England, yet having a spiral ornament very

FIRE AT THE FARM BUILDINGS, BURDEROP PARK, SWINDON.
A destructive fire occurred at these farm buildings last November, when 22 head of cattle were destroyed. sixty-six others were saved, mainly through the special drop-pin fastenings, which had only to be lifted to release the beasts. The cattle mangers and stalls can be seen standing up uninjured by the fire.

similar to that on some of the Venetian examples. Then the spandrel carving from Stone Church, near Gravesend, was illustrated, which, the lecturer remarked, was one of the most beautiful pieces of carving in England. The development of stone carving in England was traced, and it was shown how rapidly this developed in England into a beautiful refined interpretation of masonry. You will say, Professor Pite concluded, that I have shown you nothing later than the mediæval period, and that I have not touched on the problems of the Renaissance and the work of our own day. In working as we do we may learn to deal with the handicrafts for what they are worth, but let the student set himself to work to thrash out the question for himself, let him see what he can do most simply, most readily, to express himself in the way of ornament, as the circumstances will allow. We have looked at Sicilian churches, but it has come home to us in the mediæval stonework of the mediæval period, that the craftsman became an artist simply by tackling his work honestly and directly, and I would suggest that in whatever age we live all work honestly, intelligently, and pleasurably done is beautifully done, and what is beautifully done is artistically done.

THE GUILD OF ARCHITECTS' ASSISTANTS.

We have received from the Guild of Architects' Assistants a copy of the form they are issuing to elicit information of a definite character regarding unemployment. The replies may be sent anonymously. The questions asked are as follows:—Present and former salary; duration of professional experience and age; duration of unemployment as assistant; were you articled; and for how long?; have you been engaged in other business during the above time, if so, how long?; have you acted as principal in an office rented by yourself, if so how long?; how much time have you spent in the provinces?; have you any professional qualifications (R.I.B.A., S.A., etc.), or have you passed any technical examinations?; any other information you may care to add. Replies are to be sent to the hon. secretary, 137, Church Street, Edgware Road, W.

The following is a statement of the objects and constitution of the Guild.

Objects.

The objects of the Guild are to unite all sections of the profession for mutual aid, and for the consideration of all questions dealing with the relationship of the assistant and the principal.

To assist members in matters of improvement in their professional education, and in maintaining and improving the professional status.

To organise and maintain a system of insurance.

Constitution.

The Guild to consist of a central body in London, and branches, governed by an Executive Council in London, and branch committees.

An annual conference of delegates from central body and branches including representatives from architectural societies to be held in London, to advise the Executive Council, but to hold no executive power.

Annual general meeting of delegates to be held in the same centre and immediately preceding the annual general Guild meeting, reporting its decision to the latter.

The annual general meeting to be held in different centres each year.

President, vice-president, Executive Council, honorary secretary, secretary and treasurer to be appointed at annual general meeting after declaration of ballot.

The Council to appoint Finance, Legal and General Committees.

A special committee to be elected by full members to manage the insurance scheme.

Branches to have a chairman, vice-chairman, secretary or hon. secretary, and a committee elected from its members at annual meeting of branch.

Branches to be autonomous and to pay an agreed percentage of their contributions to the central branch for general purposes.

Members to be proposed and seconded by two existing members, and balloted for at a general meeting of the central body or branch, four black balls to exclude.

Members' subscriptions to be 5s. per annum, and a further subscription to be levied upon those wishing to participate in unemployed insurance.

Members to be divided into two classes, ordinary members with no insurance benefits, full members with insurance benefits.

Any assistant who has held his present position or who has been in employment continuously for twelve months previous to entry, under 40 years of age, and can produce a certificate of good health from a medical officer appointed by the Guild, and can show good testimonials as to his professional ability is eligible for insurance benefits.

In cases where principals are not available within the Guild for election and a principal has intimated a desire to assist in the work of the central or branch committees, he may be elected or co-opted by the existing committees, and shall continue in office one year, and have equal voting powers with his colleagues for that time.

The number of principals on the Executive Council and all committees never to exceed one-third of the total number.

Branches to frame their own rules as to admission of principals.

Central Body.

To receive contributions from branches for executive purposes.

To have complete control of the scheme of finance relating to the Guild, and the Unemployed Insurance to be managed by the Finance Committee and treasurer, who report monthly the finance position to the Executive.

Two auditors to be elected yearly.

The names and addresses of members of the Guild to be kept by the secretary.

The employment bureaux to be managed by the secretary, who will keep lists of members (their description and qualifications) requiring employment (registered and guaranteed by local or central committee) and of employers (salary, hours and office conditions) requiring assistants.

To reply to any local advertisements or enquiries for assistants.

To obtain all necessary information concerning unemployment and situations vacant through members of the Guild or by technical journals.

Fares to be advanced in special cases to established members if finance will allow.

To maintain a scheme of unemployed insurance and payment of lump sums.

Assistance in special cases to members approved by branch and Executive Council through a contingent fund.

Employment bureau to be open to all assistants, members and non-members, providing the latter pay a fee of 5s. if successful in obtaining an appointment.

To receive all complaints relating to professional grievances, addressed either orally at a general meeting or by letter to the secretary, and to deal with such cases either legally or otherwise.

To keep the press well informed as to the condition of architectural practice and employment.

To found scholarships or prize-money or payment of nomination fees for deserving students showing themselves capable.

To print and publish the monthly report edited by the secretaries, a copy of which is to be sent to each member, and all articles therein to be sanctioned by the Executive.

The Legal and Finance Committees to pass a report monthly to the General Committee, who will publish same in the monthly report.

The monthly report to give complete available particulars as to the state of employment in the various Guild centres.

Monthly meetings to be held and lectures on all phases of architectural practice and education to be arranged and approved by the Executive.

Branches.

To pay an agreed percentage of contributions to the Executive.

Two auditors to be elected yearly, not already members of branch committee, to audit branch accounts monthly, and forward to Finance Committee for insertion in the monthly report.

The names and addresses of members of the branch to be kept by the secretary.

To maintain an employment bureau and provide information of local news as to employees and employers to the central body for publication in the monthly report. The secretary to reply to local advertisements or enquiries for assistants.

To receive all complaints relative to professional grievances addressed either orally at a branch meeting, or by letter to the branch secretary.

To report to the central body all cases which should be dealt with either legally or otherwise.

No branch to act independently of the Executive.

To inform the local press of the conditions of architectural practice and employment.

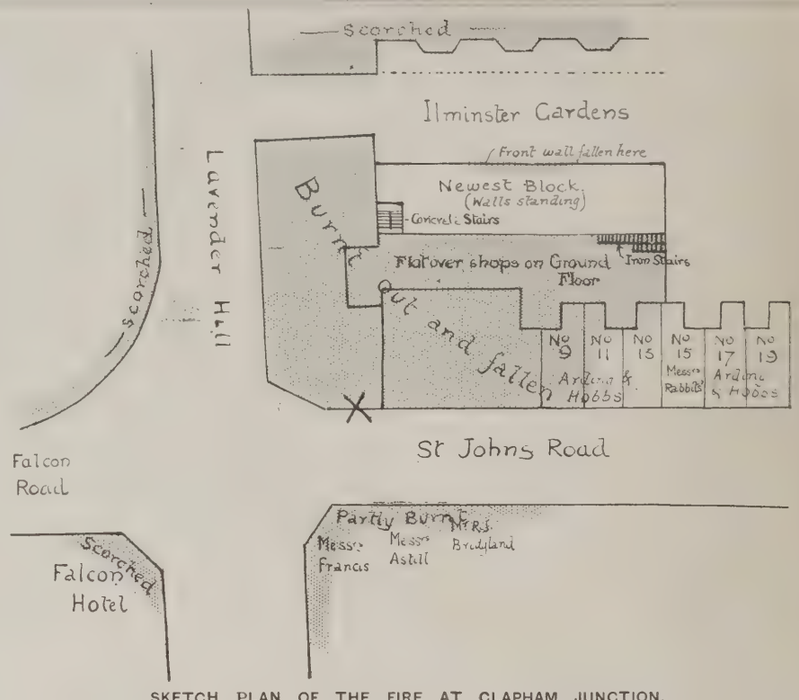
Any cases of dispute locally to be discussed at a meeting convened by the branch, in which local press representatives and any principals may be invited. A report to be made to the Executive Council for advice, and their decision as to any action that may be taken thereon.

To found scholarships or prize-money, or payment of nomination fees for deserving students showing themselves capable.

Monthly meetings to be held, and lectures on all phases of architectural practice and education to be arranged and approved by the Executive.

THE CORDWAINERS' HALL.

The new hall which is being built for the Cordwainers' Company, has a frontage to Cannon Street of 62ft., and has a depth of 60ft., or thereabouts, and is the sixth hall built upon the same site, the first hall having been built in or about 1393. The new building provides for an entrance to the hall premises at the western end of the site, leaving the rest of the frontage to Cannon Street, by a depth of over 30ft., for letting purposes on the ground and basement floors. This part of the premises will be self-contained, and quite distinct from the rest of the premises to be occupied by the company. The entrance hall is octagonal on plan, and is to be finished in marble, and leads to an inner hall, from which the main staircase ascends to the upper floors. At the foot of this staircase cloak-room provision has been made, and an electric lift provided to serve throughout the premises. The mezzanine floor will contain a suite of offices for the use of the clerk of the company, a large committee room, and also an office for the beadle. The first floor will contain the court room, and the court reception room, while on the second floor the large hall is situated. This hall will be 60ft. in length by 32ft. wide, and 23ft. high. On the top floor accommodation is provided for the beadle, and a kitchen to serve the large hall. Internally, the premises are to be fitted with oak on the main floors, the staircase being oak throughout, and the large hall is panelled in oak to a height of 20ft., or thereabouts. Besides the main staircase, a secondary service staircase is provided, fitted with electric lifts for quick service from all floors. The builders for the works are Messrs. Ashby and Horner, of 8, Aldgate, E., and the building is being carried out from the designs prepared by the company's surveyor, Mr. H. Chatfeild Clarke, F.R.I.B.A., of 63, Bishopsgate Street Within, E.C. Mr. W. Crossley is acting as the Clerk of Works.



THE CLAPHAM JUNCTION FIRE AND ITS LESSONS.

The searching inquiry into the disastrous fire of December 20th, which destroyed the premises of Messrs. Arding and Hobbs, drapers and furnishers, at Clapham Junction, was of considerable value to those interested in fire protection and fire-resisting construction.

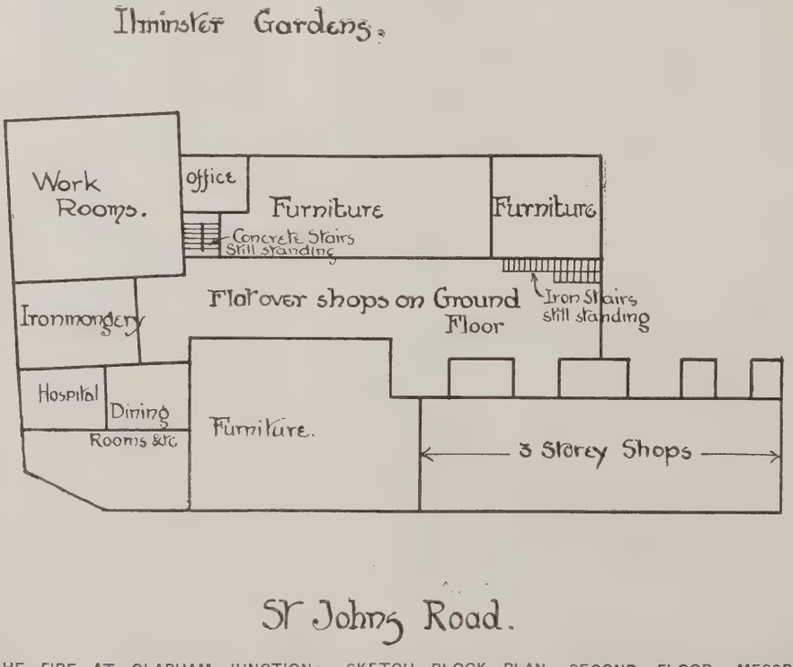
The business of the firm and the class of building in which it was housed are typical of many similar firms in London, the suburbs and provincial cities. The fire started from a simple and ascertained cause, it burned with incredible rapidity and ferocity, destroying buildings covering some acres of ground, and involved the loss of eight lives.

Nature of the Buildings.

Messrs. Arding and Hobbs commenced business on this site in premises then existing at the corner of Lavender Hill and St. John's Road, these premises being constructed of brick and stone, with exposed columns and girders to carry the floors. The business being a progressive and successful one, the firm from time to time took in further shops extending up Lavender Hill and along St. John's Road, so that at the time of the fire they occupied a large block of buildings bounded on the three sides by public thoroughfares, and comprising Nos. 315 to 325 (odd numbers) in Lavender Hill and Nos. 1 to 19 (odd numbers) in St. John's Road, with the exception of No. 15, which was occupied by Messrs. Rabbits, boot manufacturers. The shop windows therefore extended in an unbroken line from the corner of Ilminster Gardens round to No. 19, St. John Street. Ilminster Gardens is a residential thoroughfare, and here there were no shop windows; but the most recent addition to the premises faced this thoroughfare and consisted of a large block extending up five floors. In this block were the trade and employees' entrances, lavatories, etc., and here also were the concrete staircase and concrete block partitioning which withstood the fire. The floors in this block were carried as elsewhere by steel joists and uncased stanchions, and the floors themselves were concrete panels between the joists. The walls in this new block were plastered, but in the older buildings matchlining was largely used for casing the walls, girders, and stanchions. The original shop

SKETCH PLAN OF THE FIRE AT CLAPHAM JUNCTION.
The spot where the fire commenced is marked with a cross.

of the firm at the corner of St. John's Road and Lavender Hill was a building of five floors, surmounted by a large cupola at the corner; but the other shops in St. John's Road were lower (having only ground, first and second floors) and formed part of a row of shops along this street. The floors in these shops were of the ordinary wooden type. These shops were in direct communication at the ground floor level with the rest of the buildings.



Fire Precautions.

As regards fire precautions, the buildings were well fitted in some respects. There were 12 double fire doors provided under the L.C.C. requirements; also 15 fire hydrants supplied by a high-pressure main which had been specially laid in Lavender Hill; and a considerable number of hand grenades and chemical extinguishers about the premises. An iron escape staircase by the St. Pancras Ironworks was provided from the upper floors to the concrete flat at the back of the premises, and escape shutes from several of the windows. The firm had a fire brigade formed of employees, trained and periodically inspected. A fire-bell was also provided which, it was stated, could be heard in any part of the premises. In view of the Christmas trade, extra fire buckets and extinguishers had been provided, and some of the buckets were placed in the very window in which the fire broke out. There was no sprinkler system installed, although the question had often been considered by the firm. Apparently from the evidence a sprinkler system would have been expensive, and it was thought that the buildings were sufficiently protected.

Nature of Contents.

The business of the firm was in general drapery and millinery, furniture and furnishing soft goods, men's tailoring and outfitting, women's dressmaking and tailoring, fancy goods, jewellery, etc., comprising all the general stock and departments of the large store draper. At the time of the outbreak the Christmas trade was in full swing, the windows were specially dressed for the occasion, and a toy bazaar was set out on the ground floor. To assist in the window display additional electric lighting had been installed. This work was done by a firm who had carried out all the electrical work on the premises for 2½ years. In previous years this temporary lighting had been inspected by the Phœnix Fire Insurance officials, but in the present instance this inspection was omitted, though it was stipulated by the firm that the work was to be executed in accordance with the Phœnix Company's rules. It was admitted that this temporary lighting had been properly carried out in all respects.

The lamps used for this temporary lighting were 16 candle-power 60 volt metallic filament lamps working in a series of two on a circuit of 120 volts. The window in which the fire occurred was dressed with very small lace and silk goods, "fascinators," shawls, woollen goods and white muslin aprons. Blue art muslin was used as decoration. At the bottom of the window were celluloid tortoiseshell and jet combs set out

THE FIRE AT CLAPHAM JUNCTION: SKETCH BLOCK PLAN, SECOND FLOOR, MESSRS. ARDING & HOBBS'S PREMISES.

Photo: Bolak.

THE CLAPHAM JUNCTION FIRE, THE MORNING AFTER THE DISASTER.

This view, taken from outside the Falcon Hotel shows the walls of the newest block of five floors still standing. The two piers standing in the foreground mark the building at the corner of Lavender Hill and St. John's Road. The hoarding in the extreme right hand corner is that erected outside the premises of Messrs. Francis and Sons.

Photo: Bolak.

THE CLAPHAM JUNCTION FIRE.

This view taken of the ruins in St. John's Road shows the twisted girders.

on a bed of cotton wool. Some fancy necklaces, etc., were suspended on wires stretching across the window, which was one of the windows of No. 325, Lavender Hill, facing St. John's Road and next to the semi-circular window at the corner, as indicated on the sketch plan by a cross.

Extent of the Fire.

The fire broke out about 4.30 p.m. The premises were not so crowded as they had been during the afternoon, owing to the tea-hour, but it is estimated that about 1,000 people were in the building, of whom about 370 were employees. A male assistant had entered the window to reach one of the fancy necklaces, previously mentioned, and had just grasped it when he heard a loud sound, apparently just beneath where he was standing. He saw no flash, but immediately flames flew up all round him. The explosion took place in the middle of the window. In his opinion one of the globes had exploded. These globes were a few inches above the cotton-wool. Early accounts stated that in reaching for the necklace the assistant had displaced an umbrella which had fallen on to and broken the lamp, but this statement was not borne out by the evidence at the inquest. The assistant stated that he did not notice what took fire first, but when he looked down the cotton wool was on fire.

It seems clear therefore that from some cause or other, such as accidental violence, a short circuit, or atmospheric pressure on a weak bulb, one of the lamps broke and set fire to the cotton wool. Though the electrical journals have protested somewhat vehemently against this deduction, it is borne out by experiments made after the fire by Mr. S. G. C. Russell, the electrical expert of the Phœnix Insurance Company, which showed that the breaking of a metallic filament lamp suspended over a mass of cotton wool instantly set the latter alight. The circumstances of the fire are no doubt unusual; but though "The Electrical Times" states that "it seems ridiculous to suppose that anything but a specially prepared tinder could be ignited by" such lamps, one can hardly imagine a better form of tinder than cotton wool or a better material to feed the initial flame than celluloid.

The fire spread with extraordinary rapidity. The manager of a shop opposite this window says that the interior turned yellow with flames that broke out like a flash, and that within three minutes the glass came out. One or two of the officials of the firm appear to have warned employees on the upper floors of their danger; and there would seem to have been ample time for all to have got safely away. Those who perished seem to have remained at the windows in the front of the building instead of seeking an exit at the back. Possibly the fact that the electric light either went out or was turned out added to the confusion and made exit a matter of difficulty. Only three out of the twelve fire doors were closed, some being left open for the passage of the fire hydrant hose; but the fire quickly got beyond the control of the employees' brigade, which had to beat a retreat. In such general excitement eye-witnesses' accounts are apt to be confused or contradictory. One spectator affirms that the roof was burning within ten minutes, others that flames showed through within half-an-hour. Certainly the whole place was gutted and most of it fallen down within two hours of the fire commencing. The exposed columns and girders, quickly affected by the fierce heat and water, sagged and collapsed, bringing down the floors and walls depending on them.

The walls of the newest block in Ilminster Gardens are standing, but the roof and most of the floors have gone, and the interior is gutted. The centre part of the front to Ilminster Gardens has also fallen out; but the big wall dividing it from the older buildings at the back stands, and can be seen in the large general view of the ruins that we publish. The granolithic stone staircase by Stuarts Granolithic Stone Co., erected in 1897, and the iron staircase are both intact. Along St. John's Road the fire spread as far as what appears to be No. 9, which is burnt out, only the front wall remaining. Nos. 11 and 13 are structurally intact at the front, but damaged at the back; No. 15, Messrs. Rabbits' boot store, is now open for business, as also Messrs. Arding and Hobbs's two other shops, Nos. 17 and 19. So fierce was the fire that the fronts of the houses in Ilminster Gardens, of the shops on the oppo-

Another view of the ruins from St. John's Road, showing distorted girders.

site side of Lavender Hill, at the corner of Falcon Road and the front of the Falcon Hotel, were badly scorched, and had windows broken. Some of these buildings were from 70 to 100ft. away. The premises of Messrs. Francis and Sons, Messrs. Astill, and Mr. R. J. Bridgeland, on the opposite side of St. John's Road, a comparatively narrow thoroughfare, took fire and were badly damaged. Some of this damage was due to the street decorations put up by the tradesmen at Christmas time, which helped to spread the flames across the roads.

The Lessons of the Fire.

From the point of view of modern fire-resisting construction, it is clear that these premises were, as a whole, not satisfactory; but it must not be forgotten that most of the buildings were, if not particularly old, of a date anterior to the foreward movement in fire-resisting construction. Moreover, as has been said, the premises represented a gradual aggregation of separate shops and other buildings, which were altered as they were added from time to time, and in which solid walls had to be cut away and superincumbent walls supported on stanchions and girders. The great danger lies in the fact that most of the great drapery establishments have been built up in a similar manner, and are therefore exposed to similar risks. Indeed, it is doubtful whether many of them are equipped with so complete a system of fire hydrants and extinguishers as were Messrs. Arding and Hobbs's premises. The grave risk of housing highly inflammable stock in speculative-built shops with wooden floors and matchlined interiors is greatly increased when the party walls are cut away to permit communication from one shop to the other. Moreover, concrete panel floors (especially if made of coke breeze) carried on exposed steel joists and girders, cannot to-day be considered fire-resisting, nor can any system in which naked steel is employed.

The merits of reinforced concrete as a fire-resistant are well known; and reinforced concrete will probably largely take the place of steel in future structural work. The value of plain concrete has been sufficiently demonstrated by the behaviour of the granolithic stone staircase and the concrete block partitions in this Clapham fire. And if steel is used the methods of encasing it with concrete or with hollow tiles have been before the public for many years.

Apart from any questions connected with this particular fire, these large drapery shops are troublesome buildings from the architect's point of view. The result generally of gradual additions and extensions, is that anything like clear and direct planning is generally precluded, and the demand for abnormal window space militates against an æsthetic or rational treatment of the elevations. From the public point of view the fire danger must be considerable. The tall fixtures and the invariable policy of hanging goods suspended on rods obscure the view in all directions; the awkward planning and the haphazard placing of the communicating doors makes it difficult to find one's way about. When, as in the Clapham fire, the outbreak of fire is immediately followed by the lights going out, the possibilities of a catastrophe are immeasurably increased.

The danger of using unprotected electric lamps near inflammable substances, a practice which Mr. Russell says is generally pursued in London, seems to demand some legislative restriction, since it is in the mind of every electrical engineer that lamps may break and cause a fire. The practice of wiring metallic filament lamps in series does not seem to us as satisfactory in large establishments as the installation of an auto-transformer, so that the lamps may be used singly. Any difference or deficiency (however small) in the capacity of one lamp wired in series is bound to lead to trouble eventually; and such a defect is not to be ascertained easily beforehand. The necessity of having distinct control switches so that the lamps in any one section of a large establishment can be switched off without extinguishing the lights throughout is also indicated.

The outstanding lesson of the Clapham fire, however, is that the provision of extensive hydrant system and extinguishers is of little use unless the buildings containing inflammable goods are capable of resisting the hottest fires, and are so subdivided that the fire can quickly be restricted to the area in which it commenced. Though every material known will succumb to some degree of heat, it must not be forgotten that the restriction of the fire to a small area will prevent a fire ever attaining such proportions and to such a degree of heat as will destroy the most modern methods of fire-resisting construction.

THE CLAPHAM JUNCTION FIRE.

View of one of the fire-doors which spacing was not closed and has been warped by the fire.

STEELWORK ENCASEMENT.

The Rev. J. P. Bacon-Phillips writes to point out that in almost every instance during the last few years when fire has done vast damage in an almost incredibly short time, it has almost invariably been caused by the collapse of iron or steel girders. He very rightly contends that these girders could be encased more efficiently than in many cases they appear to be. This is a point that is emphasised in nearly every great fire of recent times, and it is strange that a lesson that is so often and so strongly enforced should be so persistently neglected. This is surely not for want of efficient means of encasement, but would appear to be generally due to the short-sighted economy of the building owner, who, in the case of the shopkeeper, is apt to go to the limit of his resources in the effort to make an imposing show, and is apt to cut down expenses on items that do not come into this category. In such cases the architect should be firm in his insistence on the necessity of adopting the completest possible equipment against fire risks. As we have repeatedly said, and as our advertising pages prove, the means of reducing risks to an absolute minimum exist in abundance. A most serious responsibility attaches to the rejection of such means; and, in view of frequent calamity, it has become an urgent question whether their adoption should not be made compulsory. Already we notice that the Law and Parliamentary Committee of the Hammersmith Borough Council is considering a resolution urging upon the London County Council the expediency of applying for statutory powers to inspect extensive shop premises, bazaars, and the like, within its area, to which the public are attracted in large numbers, and particularly when ordinary trading is supplemented by entertainment, and to make such requirements as to exits, gangways, doors, stairs, lighting, and other matters as may be essential to the safety of the public.

* * *

The challenge cup for the smartest piece of work during the past year has been awarded to the Shoreditch station. The Cannon Street Station is commended for its work at a fire in Cannon Street on August 22. The fire, it will be remembered, affected over 70 sets of offices, but was confined to one block.

SOME RECENT REMARKABLE FIRES.

A fire, which by the prompt action of the Fire Brigade, was happily checked before becoming serious, broke out on the premises of the Edison and Swan United Electric Light Company in Queen Street, City. It was discovered at eight o'clock, when the only persons on the premises were the staff of cleaners. Smoke was observed coming up from the basement, and the fire alarm was at once rung. Fortunately the premises are only a few yards away from a fire station in Cannon Street, and firemen with their appliances were on the spot without loss of time. No flames could be seen, and some difficulty was experienced in discovering the exact locality of the outbreak. The difficulty was overcome by the use of the smoke helmets with which the brigade is provided. These helmets fit right over the head and face, in the same manner as a diver's helmet, and are connected with a reservoir of air which is carried on the back, the wearer being thus enabled to move about with impunity amid suffocating fumes. Several firemen in these helmets disappeared with a hose into the blinding smoke, and in a short time they were directing jets of water on to the fire, which was consuming some of the stores kept in the basement. It was quickly extinguished, and no damage was suffered in any other part of the premises. The cause of the outbreak is not known.

A fire broke out late at night at Birmingham Small Arms Factory. The outbreak is said to have begun in the stationery department—a range of buildings covering an acre and a half. The flames spread with remarkable rapidity, and it was feared at one time that the larger range of buildings known as the gun-making department would be involved. There is, however, a wide road running between the two sections, and the wind blowing in a safe direction the larger block was kept intact. As it was the whole of the roof of the stationery department and warehouses was practically destroyed, and damage to the extent of several thousands of pounds done. There is a private brigade on the premises, and this was got to work immediately.

A fire occurred at the works of the Orchestrelle Company in Goldsmith Street, a narrow thoroughfare with a right-angled bend leading from Macklin Street to Drury Lane. The premises, which stand at the bend of the street, are four storeys high, and are of considerable depth from front to back. The business carried on there is the making of mechanical musical instruments, and more than a hundred hands are employed. A little before six o'clock in the evening a burst of smoke and flame was discovered in the basement, and the alarm was immediately given. It was quickly seen that the fire appliances at hand were not equal to dealing with the outbreak, and information was conveyed to the Fire Brigade, who, under the command of Lieutenant Sladen, attended with eight engines and the horsed fire escape. The Salvage Corps was also present. The first care of the members of the firm was to get all their employees out of the building, and this was safely accomplished. The operations of the brigade were somewhat hampered by the narrowness of the thoroughfare, and in spite of their vigorous attack the flames gained headway and rapidly spread to the ground floor, and eventually reached the first storey. The smoke from the burning stock, much of which consisted of music-rolls, was so dense that a fireman became unconscious while inside the building. Six of his comrades carried him out, and he had to be removed to Charing Cross Hospital. The fire was completely subdued after about three hours' strenuous work by the brigade.

THE KILBURN DRAPERY FIRE: VIEW OF PART OF THE PREMISES FROM THE HIGH ROAD.

Photo: Topical.

THE KILBURN DRAPERY FIRE: VIEW OF PART OF THE PREMISES FROM THE HIGH ROAD.

This fire, very similar in its origin and results to that at Clapham Junction, was fortunately not attended by fatal results. The outbreak occurred on an early-closing day, and only a small proportion of the employees were on the premises.

A great fire broke out at five o'clock on the afternoon of January 1st, at the Customs tobacco stores, Alexandria, Egypt, containing tobacco to the value of nearly a million sterling. The port fire brigade succeeded in restricting the conflagration to one half of the buildings, which were gutted, the loss being roughly estimated at £300,000. The German cruiser "Freya" sent 200 men on shore to help the firemen, and they rendered valuable service, forcing windows and doors and salving hundreds of bales. An unsatisfactory feature of the outbreak was the fact that it assumed large proportions before the alarm was given.

A serious fire has occurred at Port Antonio, Kingston, Jamaica, the Hotel Titchfield having been completely destroyed and other buildings burnt. The loss consequent on the destruction of the hotel is estimated at £60,000. It falls principally on the United Fruit Company and other American concerns.

A very serious fire, closely resembling in many particulars that which recently caused the destruction of Messrs. Arding and Hobbs's establishment at Clapham Junction, occurred last Thursday evening at Kilburn, involving loss and damage to the premises of Messrs. B. B. Evans and Co., High Road, to an amount which is estimated at over £60,000. Like the Clapham Junction fire, the scene of the disaster was the extensive premises of a suburban drapery firm, and the outbreak has been—perhaps erroneously—attributed to the fusing of an electric wire or the explosion of an electric lamp in the front window. Fortunately, however,

Photo: Topical.

THE KILBURN DRAPERY FIRE: VIEW IN THE INTERIOR.

The effect of fire on exposed steelwork is clearly shown by the twisted and sagged joists.

there was no loss of life. Thursday being early-closing day at Kilburn, practically the whole of the staff, numbering 150, were absent when the fire was discovered a few minutes before half-past five. Messrs. Evans's premises consist of ten shops, Nos. 142 to 160, with a frontage of some 200ft., and when the firemen had got the blaze under control after three hours' hard work, three of these shops had been completely burnt out, and great damage done to the greater part of the remainder. The establishment was closed for the half holiday at two o'clock, but it had been arranged to have the windows lit up after dark, and a few minutes after the light had been turned on it was discovered that the goods displayed in one of the centre windows were alight. The flames spread in every direction with extraordinary rapidity, and had got a good hold before the firemen from the neighbouring fire station were on the scene, and there were soon thirty fire engines on the scene, and immense volumes of water were being poured into the burning mass. In half an hour the roof of the shop where the fire originated collapsed. After the place had been burning for two hours and a half, a portion of the front wall collapsed, happily without injury to anyone. By this time the work of the firemen had begun to tell, and at half-past eight several engines were able to return to their stations. When the fire was at its height it was found that the flames had reached stables at the rear.

Buildings in Progress and Completed.

AMBLESIDE.—A new infants' school at Ambleside, erected by voluntary subscription, was opened on Saturday, by the Bishop of Barrow-in-Furness. The building is erected on a portion of the playground of the Kelsick Boys' Elementary School, and was designed by Mr. W. L. Mason, architect, Ambleside, and built by Mr. Arthur Jackson, contractor.

BERLIN.—The proposed new Grand Opera House in the West of Berlin is rapidly taking form under the direction of the impresario, Herr Berg, the owner of the Thalia Theatre here. The manager of the new house is to be Herr Angelo Neumann, the present manager of the National Theatre at Prague. The new building will be in the best situation, and will probably run the Royal Opera very close. The latter is altogether unworthy of Berlin.

BLACKWOOD.—The new elementary mixed school is centrally situated on a commanding site near the Drill Hall. The site comprises about 1½ acres, and is sufficient for doubling the present accommodation. It has picturesque gables, lofty central hall, and covered playground. There is a mixed department for 350 boys and girls, exclusive of cookery classroom. The rooms consist of six classrooms, five of which open direct on to a central hall 56ft. long by 24ft. wide, together with commodious cloakrooms, lavatories, and entrance vestibules, also a large cookery kitchen for girls and teachers' room. The furnishing and equipment are up to date. The heating throughout is by means of large open fireplaces and a low-pressure heating system, and ventilation has been well provided for. Owing to the steepness of the site the playgrounds have been placed at two different levels. Mr. F. Bond, of Cardiff, was the builder, the cost of the work being a little over £6,500, and Messrs. James and Morgan, FF.R.I.B.A., Cardiff, were the architects, assisted in the superintendence by Mr. E. Evans, clerk of works, of Gilfrach, Bargoed.

COATBRIDGE.—The new Coatbridge Higher Grade School and Junior Students' Centre has been formally opened. Erected at the corner of Albert Street and Dunbeth Road, to plans prepared by Messrs. H. and D. Barclay, Glasgow, at an estimated cost of £21,000, the building is really a handsome one, both externally and internally. The main building fronts Albert Street, and a separate building, in which are housed the gymnasium, manual workshop, cookery, and dressmaking classes, has a frontage to Colt Terrace. On the ground floor there are two physical laboratories and six classrooms for 40 each, headmaster's room, teachers' common room, and male teachers' room. On the upper floor there are a chemical laboratory, two art rooms, six classrooms for 30 each, and a female teachers' room. The manual workshop is fitted with 20 single benches, with a store-room attached. The heating, lighting, and ventilation are on up-to-date lines.

CONONLEY.—A new school built for the village of Cononley, near Skipton, by the West Riding County Council, to replace the National School, which has been in existence since 1845, but has for some time been unsuitable for its purpose, was opened on Saturday by Mr. F. J. Wilson, of Lothersdale. The school, a neat little structure, comprises a main hall 44ft. long by 23ft. wide, parallel with which are three classrooms each 20ft. by 20ft. The lighting, ventilation, and heating arrangements are on up-to-date lines. The school, which will accommodate 124 scholars, has cost £2,128, which, after deducting a Government grant towards the building of £960, works out at £9 8s. 4d. per scholar.

EBBW VALE.—The Willowtown new schools, Ebbw Vale, have been formally opened. The new school is situate at the west end of Brynheulog Street, and is in the heart of a populous and rapidly increasing district. It stands in about 1¾ acres of land, acquired from the Ebbw Vale Steel, Iron, and Coal Company, Ltd. The schools, which are in two blocks, consist of mixed and infants' departments. The exterior is in Pennant dressed stone, with brick quoins, and Forest of Dean stone dressing. The interior is up to date in every detail, and designed on the central hall principle. There are six classrooms in each department, accommodating 50 and 60 children respectively. The total accommodation of the mixed department is for 340, and the infants' department for 320, with further provision for 140, should the rooms, now intended to be used as a manual and cookery centre, be required for ordinary teaching purposes, so that the total accommodation will therefore be for 800. Great attention has been paid to the ventilation, which is on the system of fresh air inlets and copper domed ventilators, in addition to which the windows open at the top and bottom on patent gearings. The rooms are large, lofty, well lighted, and perfectly heated. The walls to a height of 4ft. 6ins. are of coloured glazed brickwork, which are easily cleaned. The floors are of rift sawn blocks, laid by Messrs. Nicholson and Sons, Leeds, and the corridors are of rock asphalt, laid by Messrs. Wainwright, Shepton Mallet. The whole of the furniture is in keeping with the building, and consists of oak to special specifications and designs of the architect, and supplied by Messrs. Bennett and Co.,

London and Glasgow. The playgrounds are all asphalt. The schools, which are among the finest in the county of Monmouth, were erected by Messrs. Williams and Sons, New Tredegar, according to plans prepared by Mr. Henry Waters, M.S.A., Ebbw Vale and Beaufort, the architect to the Ebbw Vale Education Authority, and the work has also been under his personal supervision, the cost approximately being about £16,000.

GREAT CROSBY.—The Great Crosby Council School, Coronation Road, Great Crosby, has been opened. The school has been erected in accordance with plans prepared by Mr. Henry Littler, the county architect, and is planned in two departments in one building, accommodating 350 "mixed" and 150 infant scholars, each department having its own central hall and cloakrooms, and is so arranged that the school can be extended to provide for 300 further scholars. The building is faced externally with Accrington bricks, with stone dressings. The cloakrooms and entrances have salt-glazed brick dadoes with Accrington bricks above, and the classrooms and central halls have tiled dadoes with plaster above. The floors of the cloakrooms and entrances are of concrete with granolithic finish. The internal joinery is in pitch pine. The building is heated by hot water on the low pressure system, and is lit by electricity. Special rooms are provided on the first floor for the teaching of cookery, and manual instruction, together with a lecture-room and laboratory, with separate boys' and girls' entrances, staircases, cloakrooms, lavatories, and storerooms. The floors of this department are of fireproof construction, and the rooms are finished in a similar manner to those in the main school. The playgrounds are asphalted.

GRINDLEFORD.—The foundation stone of a new church at Grindleford has been laid. A site was given by Mr. E. A. J. Moynard, and a fund was started to raise the £2,000 required. This has now been obtained, but a further £500 is necessary. The building which is being put up consists of a chancel and side chapel, vestries, and a temporary nave, which will seat about 165 persons.

HARROGATE.—The Education Committee of the Town Council, having considered and amended the specifications for the building of a new Infants' School at Bilton, recommended the Council to apply to the Board of Education for sanction to construct a swimming bath in the basement at an estimated cost of £300, and that the necessary approval of the Government Departments of all the amendments be obtained.

NEWMAINS. — At Newmains, near Wishaw, a new institute has been erected by Mr. James Hamilton Houldsworth, of Coltness, to provide recreation and useful instruction for the people of the village. The building is one storey in height, but is planned for extension if found necessary. It is equipped with a billiard-room having three tables, a commodious reading-room, a large tearoom, and four bath-rooms, together with cloakroom and other conveniences, and caretaker's house adjoining.

OKEHAMPTON.—A dinner was given by Messrs. Blatchford and Dawe proprietors of the Mid-Devon Joinery Works, in celebration of the completion by the firm of the block of premises built for Lloyd's Bank. The building, which is imposing in appearance, commodious, and peculiarly convenient for its purpose, occupies a prominent position at the corner of Fore Street and Lodge Road. Messrs. Horace Field and Simmons, of London, were the architects, and the contract was obtained by Messrs. Blatchford and Dawe in open competition with well-known London, Birmingham, Bristol, Torquay, and other firms. The price was, roughly, £6,000.

OXFORD.—The City Council, at their meeting on Wednesday, accepted the contract of Mr. Henry Flint, of High Wycombe, for £9,487, for the erection of the South Oxford Schools.

ROCHESTER. — Mr. D. R. T. Glazebrook, F.R.S., Director of the National Physical Laboratory, Kew, opened the new science building at the King's School, which has been erected as a memorial to the late Archdeacon Cheetham on the west side of the playground, with its principal front facing thereto, and practically at right angles to the older building of the school, with which it has been designed to harmonise. The exterior walls are faced with red bricks, with the exception of a part of the west elevation to St. Margaret's Street where the old stone boundary wall has been left standing and heightened. The roof is covered with hand-made tiles. Above the entrance are carved in Ancaster stone the arms of the Dean and Chapter, the monogram S. C. (Samuel Cheetham), the dates of the foundation of the school (1542), and the erection of the new building, and the words, "Deus Scientiarum Dominus." Inside the entrance is an alabaster tablet bearing the following inscription:—

IN MEMORIAM SAMVELIS CHEETHAM
ARCHNI ROFF: ET BENEFICIO
HUIVSCE SCHOLAE FAVTORVM
HAEC DOMUS INSTAVRATA EST
A. S. MCMIX.

On the left of the entrance is the science laboratory, 30ft. × 20ft., fitted up with working benches for 16 students, master's demonstration table, a dark room, and the usual fittings, on the left is the art room, 25ft. × 20ft. with a large north light. The walls are finished in Keeves cement. The woodwork of deal is stained with solignum and varnished. The builders are Messrs. George Baker and Son, of Pelican Wharf, Strood, and the laboratory has been fitted by the Educational Supply Association of Stevenage Wrought iron hinges and carving have been carried out by Messrs. H. H. Martyn and Co., Cheltenham. The architect is Mr. E. F. Cobb, A.R.I.B.A., Rochester.

ROYDON.—A new non-provided school has been opened at Roydon, Castle Rising. Captain Howard, of Rising Hall, gave the site and £100, and, with Mr. Raoul Everard, of Longham Hall, was guarantor for £100, loaned by the Diocesan Association, which association, together with the National Society, provided the balance needed. Locally they had also collected £100 in various amounts. The architects were Messrs. Lacey and Upcher, and the builder Mr. Seamon, of Roydon.

STOKE.—The Town Council has resolved to accept the tender of Messrs. Willcock and Co., Wolverhampton, for the erection of the new Stoke Town Hall, at £25,791.

SUNDERLAND.—The new Children's Hospital is rapidly approaching completion. It is being built for the purpose of relieving the congestion at the Sunderland Infirmary, and is situated in a healthy position amid rural surroundings, near the Waterworks and the new Barnes Park. The architectural style may be described as the early Georgian domestic. The buildings are of brick, with stone dressings, and the roof of red tiles. There will be accommodation for 46 inpatients, and the staff will be suitably housed, the whole arrangements being of a most up-to-date order. Mr. Joseph Huntley is the contractor, and the buildings are erected to the plans of Messrs. W. and T. R. Milburn, of Sunderland.

WEST EALING. — The new Lammas Council School at Cranmer Avenue, West Ealing, has been opened. The school is erected in a newly developed part of the borough, has cost £15,969, and provides accommodation for 398 boys, 400 girls, and 420 infants. There are cookery and laundry centres and a building for handicraft. Mr. Charles Jones, Borough Engineer, of Ealing, was the architect. An agitation was made for making the school a fee-paying one, but it was decided that it should be a free school.

Messrs. Moscrop-Young and Glanfield announce that they are removing to more convenient offices, and that their address is now 20, Brook Street, Bond Street, W., where they will carry on their business as architects and surveyors. Telephone: 9545 Gerrard.

Trade and Craft.

Checkfire Doors.

In a new leaflet which has been opportunely issued by the Checkfire Door Co., Tutaport Works, Lonsdale Road, Kilburn, N.W., who are contractors to H.M. Government, and to the L.C.C., etc., the construction of the Checkfire door is tersely and clearly explained. The door, as we have previously shown in these pages, has, in a total thickness of but one inch, half an inch of air space, and no outer frame is required. Consequently, they are elegant in appearance, light in weight, and noiseless in movement. The internal air-space is obviously of great importance; for whereas all materials get red-hot in time, air cannot conduct red heat. The Checkfire door is hung in plain brick rebates, thus avoiding risk from expansion.

Other advantages are enumerated in the leaflet, in which also there are short and plain directions for hanging the Checkfire door, which is accepted by all insurance companies, and has emerged triumphant from the test by the British Fire Prevention Committee.

Electric Fittings and Supplies.

The eleventh annual edition of the catalogue issued by Messrs. Simplex Conduits, Ltd., whose head offices are at Garrison Lane, Birmingham, and whose London offices and stores are at 113, 115, and 117, Charing Cross Road, W.C., contains 374 pages, and many hundreds of illustrations of their steel conduits and fittings for electric light and power wiring. The catalogue shows considerable extension in the scope of their manufactures and supplies, which have been steadily developed during the past two or three years. The Simplex practice, it is claimed, anticipated, and corresponds in every essential particular with the specification drawn up by the Engineering Standards Committee. Exact external diameters are adopted; the Simplex thread is specified as the standard conduit thread, and the Simplex socket junction as the standard method of joining with ordinary conduit. The firm's goods have been awarded eight Grand Prix and gold medals.

Coming Events.

Wednesday, January 19.

THE CARPENTERS' COMPANY LECTURES.—Mr. M. H. Baillie Scott on "The Art of Building, with special reference to the use and abuse of materials," Carpenters' Hall, 7.30 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION.—The students' meeting to hear Mr. S. Ash on "A Holiday in Belgium," is postponed on account of the General Election.

R.I.B.A.—Exhibition of Prize Competition Drawings opens at the Alpine Club, and continues until Jan. 29.

Thursday, January 20.

R.I.B.A.—Literature Committee Meeting.

Friday, January 21.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.—Professor S. D. Adshead on "Tone and Colour in Towns."

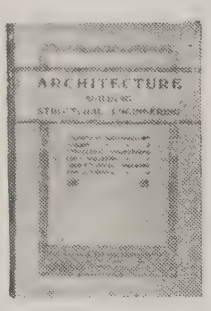
Saturday, January 22.

ABERDEEN ARCHITECTURAL ASSOCIATION.—Mr. Alex. McGibbon on "Architectural Forms not influenced by material: a Popular Opinion Confuted," 7.30 p.m.

BUILDERS' FOREMEN'S ASSOCIATION. — Annual dinner, King's Hall, Holborn Restaurant, 6.30 p.m.

Monday, January 24.

THE SURVEYORS' INSTITUTION.—Adjourned discussion on Mr. Davidge's paper, "Town-planning Systems," and on Mr. Willmott's paper, "Housing and Town-planning, etc., Act, 1909," 8 p.m.



Tuesday, January 25.

UNIVERSITY EXTENSION LECTURES ON ANCIENT ARCHITECTURE. — Mr. Banister Fletcher on Roman Architecture (Thermae), British Museum, 4.30 p.m.

MERELY DOING THE WORK WON'T DO—

You must master the **science** of your work. That's the only way to step out of the routine rut, to make your life interesting, and to increase your earnings!

The way is open to you, whatever your circumstances, thanks to the International Correspondence Schools, with their unique system of spare-time home-training by correspondence, supplemented by free service in the matter of employment.

Thousands of workers have advanced themselves by this means during the 18 years the I.C. Schools have been established. Student James Higham of Bolton writes:

"My only regret is that I did not enrol before, as although I have only been an I.C.S. Student for some six months, I have already much improved in my work, which becomes much *more interesting and attractive* under your able tuition. I have also to thank the personal effects of your Representative here who has succeeded in obtaining for me *a much better position than I held prior to joining your Schools.*"

There is an I.C.S. Course to meet your special needs. Write us a postcard, mentioning your line of work, and we will forward you full particulars of it. We will also send you a list of the Faculty, Officers and Experts, whose brains and experience we place at your disposal.

Write NOW.

PARTIAL LIST OF I.C.S. COURSES
(There are over 120 in all).

Electrical Engineering	Mining Engineering	Textiles

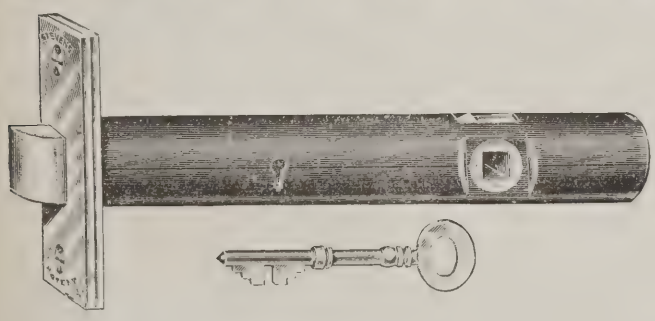
Fulwell Hydrated Lime.

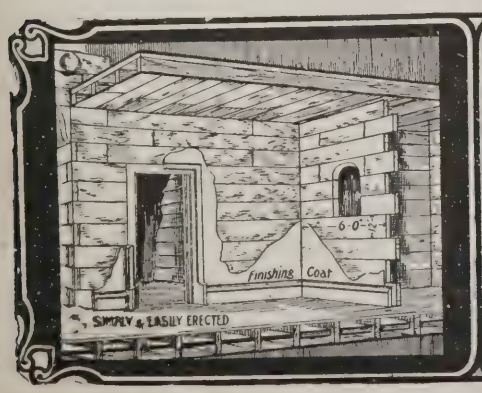
A high-class Lime, slaked by a patent process, and packed in bags. Saves the labour of washing and running the lime, will not blow, leaves no waste, may be stored without deterioration and without bursting the bags.



For mouldings and lathwork can be gauged with a much smaller proportion of plaster than ordinary lime.

Converts lime into a safe, reliable and convenient material with the advantages of a bagged plaster.

Further Particulars and Samples from:—



The Exors. of the Late
Sir HEDWORTH WILIAMSON, Bart.,
Fulwell Lime Works, SUNDERLAND.

Steven's Patent Barrel Lock

Saves 75% time in fixing.
Is absolutely reliable.
Has no delicate working parts.
The cheapest lock on the market.

TO BE OBTAINED FROM ALL WHOLESALE BUILDERS' IRONMONGERS.

FIRE, SOUND, "MACK" VERMIN PROOF.

TO CONTRIBUTORS.

Owing to the very large number of voluntary contributions submitted to the Editor, it has been found desirable to make the following regulations:—

1.—Intending contributors are advised to send a preliminary letter before forwarding articles and illustrations. The non-receipt of a reply within one week is to be taken as a polite negative. MSS. and drawings in all cases should be accompanied by sufficient stamps to cover return postage.

2.—The Editor declines to take any responsibility for the safety or return of contributions submitted, although every care will be taken where these regulations are complied with.

3.—Each MS. and illustration should bear the name and address of the owner or sender.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about **five days** after the date of this issue.
Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders.
The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the Contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Jan. 13-25. **CHATHAM.**—Erection of balconies at the Workhouse Infirmary, Chatham, for the Guardians of Medway Union. Applications for bills of quantities, accompanied by deposit of £1 1s., to be made to the architect, E. J. Hammond, Balmoral Road, Gillingham, by the 13th inst. Tenders to be delivered by post at the Guardians' held.

Jan. 22. **NATLAND (Kendal).**—Whole or separate trade contracts, for erection of proposed residence, Natland, for Ismay Barnes. Plans may be seen and quantities and specifications obtained at the offices of John F. Curwen, F.S.A., Architect and Sanitary Engineer, 26, Highgate, Kendal, to whom tenders must be sent.

Jan. 22. **HAMPSTEAD.**—Demolition of the buildings now occupying the island site enclosed by Bayham Street, Hamilton Street, Greenland Street, and Greenland Place, Camden Town, and erection of a hoarding to enclose the site, for the Council of the Hampstead General Hospital. Block plan can be seen, and copies of the specification obtained, by application to the architects, Young and Hall, 17, Southampton Street, Bloomsbury, W.C. Tenders are to be delivered at the Hospital, Haverstock Hill, addressed to the Secretary.

Jan. 24. **PONTYPRIDD.**—Alterations and additions to premises in Morgan Street, for the Committee of the Pontypridd and District Club. Plans and specification can be seen with A. O. Evans, Williams, and Evans, Architects, Pontypridd, to whom tenders are to be sent.

Jan. 24. **BLACKWOOD (Mon.).**—Erection of two shops and premises at Blackwood, Mon., for J. F. Chappel. Plans and specifications can be seen and form of tender obtained at the office of D. J. Thomas, Architect, High Street, Blackwood, Mon., to whom tenders are to be sent.

Jan. 24. **PANTGLAS, GARN, S.O.**—Erection of schoolroom, two kitchens, and other repairs at Pantglas. Plans and specifications may be seen at Bronmenach. Tenders to be sent to Rev. J. W. Jones, B.A., Pantglas, Garn, S.O.

Jan. 24. **HALIFAX.**—Various works required in erection of workshop at Highroad Well. Plans may be seen and bills of quantities obtained of Jackson and Fox, Architects, Rawson Street, Halifax, to whom tenders are to be sent.

Jan. 24. **LINCOLN.**—Erection of a public elementary school on Spring Hill, Lincoln, for the Education Committee. Builders wishing to tender should apply to the Architect, W. G. Watkins, Bank Street, Lincoln. Applications are to be accompanied by a deposit of £1.

Jan. 24. **EXMOUTH.**—Carrying out alterations at the Foresters' Arms, Chapel Street, Exmouth, for Ross and Pidsley, Well Park Brewery, Exeter. Plans, specification and other particulars can be obtained at the offices of P. Kerley, Architect and Surveyor, National Provincial Bank Chambers, Exmouth, to whom tenders are to be delivered.

Jan. 24. **DERBY.**—Structural alterations at the Union Workhouse, Derby, for the Board of Guardians. Plan and specification may be seen on application to, and bill of quantities obtained, from F. C. Coulthurst, Architect, 4, Tlbert Street, Derby. Tenders must be sent to N. Twigge, Clerk to the Guardians, Poor Law Offices, Derby. Derby builders only invited to tender.

Jan. 24. **EDINBURGH.**—Carrying out the undermentioned works in connection with alterations at 15, Duncan Street, for the School Board:—1, mason work; 2, carpenter and joiner works; 3, plumber work; 4, slater and plaster works; 5, painter work. Plans may be seen and schedules obtained at the office of Mr. Carfrae, Architect, 3, Queen Street. Estimates must be lodged with the Clerk to the Board, School Board Offices, Castle Terrace.

Jan. 24. **GILLINGHAM (Kent).**—Making the necessary foundations, etc., for one 200 horse-power Diesel oil engine and alternator, at the generating station, Gillingham Road, for the Town Council. Copies of specification and general conditions may be obtained, and the site and preliminary plans inspected, on application to the Borough Electrical Engineer, at the Generating Station, Gillingham Road. Tenders to be delivered to F. C. Boucher, Town Clerk, Corporation Offices, Gardiner Street, Gillingham.

Jan. 25. **MERTHYR TYDFIL.**—Erection of a Masonic Temple for the Loyal Cambrian Lodge of Freemasons (No. 110), at Merthyr Tydfil. Plans and specifications to be seen with C. M. Davies Architect, 112, High Street, Merthyr. Tenders are to be delivered to James Fraser, 37, Thomas Street, Merthyr.

Jan. 25. **BELFAST.**—Erection of the proposed abattoir in Stewart Street, Belfast, for the Corporation. General conditions, specification, and drawings can be seen at the office of the City Surveyor, City Hall, Belfast, and bills of quantities obtained from W. H. Stephens and Sons, Surveyors, 13, Donegall Square North, on deposit of £5 5s. with the City Chamberlain, City Hall. Tenders to be lodged with R. Meyer, Town Clerk. The minimum rate of wages paid to labourers engaged on the contract shall be not less than 20s. per week. Fair wages clause.

Jan. 25. **PORTSMOUTH.**—Additions to the boys' secondary school, Victoria Road North, Southsea, for the Corporation. Specification, drawings, and general conditions of contract can be seen at the offices of A. H. Bone, Architect and Surveyor, Cambridge Junction, Portsmouth, and form of tender, general conditions, and bill of quantities can be obtained on application to the Town Clerk, at the Town Hall, Portsmouth. Tenders must be delivered to G. Hammond Etherton, Town Clerk, The Town Hall, Portsmouth. Fair wages clause.

Jan. 25. **BETHNAL GREEN.**—Repairs to the roof of the relief hall and new flat roof with lantern lights above the relief offices in Bishop's Road, Victoria Park, N.E. (nearest station, Cambridge Heath, G.E.R.), for the Board of Guardians. Specification, conditions of contract, and form of tender can be obtained of the Clerk on deposit of £2 2s. Plans may be seen either at the Clerk's office, or at the office of the Architect, W. A. Finch, 76, Finsbury Pavement, E.C. Tenders to be sent to D. Thomas, Clerk to the Guardians, Guardians' Offices, Bishop's Road, Victoria Park, N.E.

Jan. 25. **LONDON, E.**—Erection of a coroner's court at High Street, Poplar, E., for the L.C.C. Persons desiring to submit tenders may inspect the drawings, and obtain the specifications, bills of quantities, form of tender, and other particulars, at the Superintending Architect's department, General Section, 19, Charing Cross Road, W.C., upon deposit with the cashier of the Council, at the County Hall, Spring Gardens, S.W., of £2. Full particulars of the work may be obtained on application at the County Hall, before the payment of a fee for the specification, etc. Tenders must be delivered to G. L. Gomme, Clerk of the London County Council, County Hall, Spring Gardens, S.W.

Jan. 26. **AVONMOUTH.**—Erection of ten cottages at Avonmouth, for the City and County of Bristol. Plans and specifications may be seen at the offices of Peter Addie, City Valuer, The Exchange, Bristol. Quantities can be obtained on deposit of £1 1s. Tenders must be delivered at the above offices.

Jan. 26. **HALIFAX.**—Reinstating "Kingston Confectionery Works," belonging to John Mackintosh Ltd. Plans and specifications may be seen and bills of quantities obtained of Medley Hall and Son, Architects and Surveyors, 1, Harrison Road Halifax, to whom tenders are to be sent.

Jan. 26. **ALLOSTOCK.**—Alterations and additions to present buildings at the Cheshire County Council school at Allostock, for the C.C. Plans and specifications can be seen at the office of H. Beswick, F.R.I.B.A., County Architect, Newgate, Street, Chester, and quantities obtained on deposit of £1. Tenders are to be delivered to J. H. Cooke, Solicitor, Winsford.

Jan. 26. **ABERTILLERY.**—Extension of the Queen Street infants' school, for the U.D.C. Drawings and specifications may be inspected at the office of the Architect, W. H. Hiley, Chapel Street, Abertillery. Bills of quantities supplied by the Architect on deposit of £1 1s. Tenders to be sent to N. J. Llewellyn, Secretary, Council Offices, Abertillery.

Jan. 26. **SPURSTOW (near Tarporley).**—Alterations and additions to the school buildings, Spurstow, near Tarporley, for the Cheshire C.C. Plans and specifications can be seen at the office of H. Beswick, County Architect, Newgate Street, Chester, and quantities obtained on deposit of £1. Tenders to be sent to C. E. Speakman, Clerk, Education Office, Crewe.

Jan. 26. **MANCHESTER.**—Erection of wash baths and washhouses at Miles Platting. Drawings may be seen and specifications and bills of quantities obtained at the office of the City Architect, Town Hall, upon deposit of £2 2s. All cheques or postal orders are to be made payable to the order of "The Corporation of Manchester." Tenders to be delivered at the above office.

Jan. 26. **LIVERPOOL.**—Construction of a public washhouse at Netherfield Road North, and also the engineering work required therewith, for the Corporation. Plans and specifications may be inspected and quantities for builders' work obtained on application to the Engineer and Chief Superintendent, W. R. Court, at his office, Municipal Offices, Liverpool, on deposit of £1 1s. Tenders must be posted to Edward R. Pickmere, Town Clerk, Liverpool.

Jan. 27. **OSWESTRY.**—Additions and alterations to house, Cae Glas, and all other work in connection therewith, in accordance with the plans and specification prepared by the Borough Engineer and Surveyor, for the Corporation. Plans, specification and general conditions may be seen and bill of quantities and form of tender obtained, on deposit of 10s. 6d., and on application to G. William Lacey, C.E., Borough Engineer and Surveyor, Guildhall, Oswestry. Tenders must be delivered to S. Pryce Parry, Town Clerk, Town Clerk's Office, Guildhall, Oswestry.

Samples may be seen on application at the Stores, Skircoat Depot, up to Jan. 28. Forms of tender and full information may be obtained at the General Manager's Office, Skircoat Road. Intending contractors must state the number of schedule required. Tenders must be sent to Herbert Ashling, Town Clerk.

Jan. 29. **CHELTENHAM.**—Supply of the following for the year ending March 31, 1911, for the Corporation:—1, Portland cement; 2, forage; 3, stoneware pipes; 4, broken stone; 5, kerbs and setts; 6, coal for boilers, etc.; 7, disinfectants; 8, oils, colours, etc.; 9, castings (for two years); 10, ironmongery; 11, timber; 12, India rubber goods; 13, lead pipes, brass fittings, etc.; 14, tools for highways, etc.; 15, wrought iron, steel, files, etc.; 16, electric light fittings; 17, household goods, sundries, etc.; 18, lias lime, bricks, etc.; 19, cast-iron pipes (for two years). Forms of tender may be obtained from J. S. Pickering, Borough Surveyor, Municipal Offices, Cheltenham, to whom tenders are to be delivered.

Jan. 29. **CHISWICK.**—Execution of work and supply of stores (separately) as under, for one year, commencing April 1, 1910, for the U.D.C.:—2, oils, etc.; 3, ironmongery, etc.; 4, disinfectants; 5, Clay Cross (or Buxton) and grey lime; 6, aluminoferric or copperas; 7, cement; 8, Kentish pit flints; 9, blue Guernsey granite; 10, granite kerb, channel and setts; 11, York or other paving; 12, tarpaving; 13, asphalte; 14, pipes, gullies, etc.; 15, stationery, etc.; 16, uniforms; 17, forage; 18, jute cloths for sludge presses, for one, two, or three years; 20, maintenance of fire alarms, telephones, etc., for five years; 21, harness. Forms of tender on application or by sending stamped addressed foolscap envelope to Edward Willis, A.M.I.C.E., Surveyor, Town Hall, Chiswick, where specimens of certain of the goods (other specimens are deposited at the High Road and river depots), and forms of contract and bond may be inspected. Tenders to be delivered to Ernest F. Collins, Clerk of the Council, Town Hall, Chiswick, W.

Jan. 31. **WEST HAM.**—Supply of:—Paving materials, broken granite and chippings, road flints, sand for tramways, tar and pitch, ironmongery, etc.; iron castings, lime, plaster, etc.; Portland cement, rope and tarpaulins, etc.; hardwood, lead, zinc, and solder; oils and colour, etc.; stoneware pipes, etc.; brooms and brushes, sanitary articles and disinfectants, domestic articles. Forms of tender and further particulars may be obtained at the Borough Engineer's Office, Town Hall, West Ham, E. (where the standard samples may also be seen). A deposit of £1 will be required in respect of each form of tender. Tenders to be delivered at the office of the Town Clerk, Town Hall, West Ham, E., in the envelope supplied, by registered post. Fair wages clause.

Feb. 1. **LONDON.**—Supply of building materials, and tools, general stores, and materials, including canvas, cotton, linen, and woollen materials, warps and wefts (cotton and woollen), weaving gear, leather, grindery, tin-plates, brushmaking materials, rope, etc., for the Prison Commissioners, to any of H.M. Prisons, State Inebriate Reformatories, and Borstal Institutions, in England and Wales. Forms of tender, with all necessary particulars can be obtained at any of the prisons, etc., or at the Prison Commission, Home Office, Whitehall, London, S.W. (where also samples may be seen). Tenders must be delivered at the Prison Commission.

Feb. 2. **NORTHALLERTON.**—Execution of the work proposed to be done in connection with alterations and improvements at the Yarm Council School, for the North Riding of Yorkshire County Council. Plan and specification and forms of tender at the school on application to the master or caretaken. Tenders to be delivered to J. C. Wrigley, Secretary, County Hall, Northallerton.

Feb. 4. **ISLINGTON.**—Execution of the undermentioned contracts for one year from April 1, 1910, for the Corporation:—1, engine room stores; 2, arc lamp carbons and globes; 3, oils and lubricants; 4, transformers and accessories; 5, iron, tools, belting, cotton, rope, etc.; 6, earthenware pipes, troughs, bricks, firebricks, fireclay, etc.; 7, electricity supply meters and prepayment meters; 8, cables; 9, electrical sundries, lamps, brushes, arc lamp parts, etc.; 10, cable terminal, service, and network boxes, and tapes. Forms of tender, specification, and contract, may be obtained upon application at the Town Hall. Tenders must be delivered to Wm. F. Dewey, Town Clerk, Town Hall, Upper Street, N.

Feb. 5. **WALLASEY.**—Supply during the twelve months ending March 31, 1911, of the following materials for the U.D.C.: 1, limestone chippings; 2, granite chippings; 3, macadam; 6, pitch, refined tar, and creosote oil; 7, Portland cement; 8, curbs, channels, etc.; 9, timber; 10, stoneware street and passage gullies; 11, drain and sewer pipes; 12, granite concrete flags; 13, wrought and cast iron materials (manhole covers, name plates, etc.); 14, brushes, buckets, shovels, etc.; 17, paints, oils, white and red lead, etc.; 18, iron, steel, bolts, nuts, etc.; 19, lead and iron pipes, etc.; 20, lime; 21, drawing materials. Further particulars, specifications, and tender forms may be obtained on application at the office of W. H. Travers, A.M.I.C.E., District Engineer and Surveyor, Public Offices, Egremont, Cheshire. Tenders to be sent to H. W. Cook, Clerk and Solicitor, Public Offices, Egremont, Cheshire.

Feb. 15. **TORONTO, CANADA.**—Execution of the following work and materials for the Corporation: 3, Laying sewer outlet; 4, building seweage banks; 5, supply of iron castings; 6, structural steel; 7, sludge valves, penstocks, and pedestals; 8, cast iron pipe; 9, cranes, 10, special tile. Plans may be seen and specifications obtained at the Office of the City Engineer, Toronto, and at the Office of the Commercial Branch of His Majesty's Board of Trade, 73, Basinghall Street, London, E.C., also at the Office of John A. Farnell, 153, St. Vincent Street, Glasgow.

HOURS AND WAGES IN QUEENSLAND.

It is officially reported from Queensland that although building material is selling at rates considerably higher than a few years ago, while timber particularly is at a figure which but a short time since would have been regarded as prohibitive, new buildings and extensions, plans and proposals, are very plentiful. The Minister of Works has given his approval to the following award which has been made by the Wages Board, and which was to come into operation on Jan. 1, 1910.

Hours.—The ordinary working hours shall not exceed 44 in any one week, and shall be confined between the hours of eight o'clock a.m. and 5 o'clock p.m. on Mondays, Tuesdays, Wednesdays, Thursdays, and Fridays, and between the hours of eight o'clock a.m. and 12 o'clock noon on Saturdays, provided that during such ordinary working hours one shall be allowed for a meal on such days, except Saturdays.

Wages.—The lowest wages, price, or rate payable to bricklayers shall be 1s. 6d. per hour, or £3 6s. per week of 44 ordinary working hours; provided, however, that when bricklayers are engaged in preparing the brickwork of furnaces and settings in connection with boilers, bakers' ovens, or furnace work of any description, they shall be paid not less than at the rate of one and a quarter time the rate therein set forth.

Apprentices and Improvers.—The number, or proportionate number, of apprentices or improvers who may be employed, shall not exceed one apprentice or improver to five, or any fraction of five, bricklayers, who are in receipt of not less than the minimum rate set forth in clause 2 hereof. Provided, however, that one apprentice or improver may be employed by any employer. The lowest wages, price, or rate payable to apprentices or improvers shall be:—7s. 6d. per week for the first year, 12s. 6d. per week for the second year, 20s. per week for the third year, 25s. per week for the fourth year, and 35s. per week for the fifth year. Thereafter, not less than the minimum rate.

Overtime.—All time worked in excess of the ordinary weekly working hours before eight o'clock a.m. shall be paid for as follows:—For the first two hours, not less than at the rate of one and a quarter time the minimum rate set forth in clause 2 hereof, and for subsequent hours, not less than at the rate of one and a half time such minimum rate.

Holidays.—All time worked on any Sunday, Christmas Day, Good Friday, or eight-hour day, shall be paid for at not less than the rate of double the minimum rate set forth in clause 2 hereof. All time worked on any New Year's Day or Sovereign's birthday shall be paid for at not less than the rate of one and a quarter time the minimum rate set forth in clause 2 hereof.

The determination for stonemasons contains the following provisions:—For the purpose of the determination the following definitions shall apply:—"Building mason" shall mean a stonemason who has been working not less than four years at his craft in connection with building construction, and who is over 21 years of age. "Monumental mason" shall mean a stonemason who is engaged in preparing or fixing all stone for cemetery purposes or in preparing marble or cutting inscriptions for cemetery or other work. "Porphyry mason" shall mean a stonemason who is engaged in preparing or fixing prophyry stone for all purposes.

Hours.—Same as bricklayers' trade hours.

Wages.—The minimum rate of wages shall be as follows:—Building masons, 1s. 4½d. per hour; monumental masons, 1s. 4d. per hour; porphyry masons, 1s. 4½d. per hour.

There are also special provisions for "apprentices and improvers," "overtime," and "travelling allowances," which would take up too much space to give in detail.

It is surprising to read that the Royal Palace at Athens, which was greatly damaged by fire on January 6th, was not insured, as regards the fabric, although the contents were partly covered. The central facade and the upper storey, including the Hall of Trophies (in which were some famous frescoes), the ball-room, banqueting-hall, theatre, chapel, and service rooms. Bluejackets from the British and Russian warships in Phalerum Bay were sent ashore to help, but, for some reason or other, very little use was made of them. So far as the British sailors are concerned, this is a great pity; the handyman being, as we all know, a particularly doughty fire-fighter. It is not for nothing that ex-Navy men are preferred in recruiting our fire-brigades.

* * *

The "South Wales Argus" having published a list of amounts applied in aid of the rates from the profits of municipal undertakings, in certain large towns, during the years 1902-6, a correspondent (Mr. J. P. Elms, secretary of the Newport Ratepayers' Association) points out that during the same period, that is, commencing with the accounts for the year ending March 31st, 1903, and ending with those for the year ending March 31st, 1907, the Newport Corporation made direct payments amounting to £27,019 out of the rates, to cover the deficits upon the trading undertakings and he estimates that the indirect losses to the rates through inadequate assessments, street-lighting, misallocated charges, etc., would amount to at least as much more. He adds that his statement may possibly help to dispel the fallacy that because certain businesses can be made to yield a profit in very large towns, it necessarily follows that they will prove equally profitable in much smaller towns, where the capital required is inevitably greater in proportion to the returns, and where other circumstances militate against such an assumption.

PATENT VULCANITE ROOFING

Is essentially a Roof Covering for

FLAT ROOFS OF WOOD OR CONCRETE CONSTRUCTION

and meets the requirements of Local Authorities and Insurance Companies. It is not to be confused with Bitumen Sheetings which are not Insurance tariff roofs, and which cannot be used in all districts without having previously obtained permission.

Competition Ethics.

The letter which appeared in our last issue concerning the revised regulations of the R.I.B.A., in regard to competitions, advances propositions that are hardly likely to receive support from the majority of competing architects. Mr. Bulkeley Creswell appears as the champion of the competitor who violates the essential conditions, and he defends the right of the assessor to select such a design in preference to those which have been prepared strictly in accordance with the instructions. In such circumstances, Mr. Creswell's second proposition, that the promoters should be at liberty to discard the selected design without any imputation of bad faith, is only the barest measure of justice, since it requires but little logical progression of his view to imagine a competitor furnishing a design for a cathedral instead of a chapel, getting it accepted by the assessor, and holding up to the promoters the dread alternatives of either building it or incurring moral obloquy in the architectural world. For Mr. Creswell's idea leads to chaos; nay, more, invites it. If conditions are not to be observed, or, at all events, not to be binding, why have them? If assessors are to choose anything they please, whether it is the thing desired by the promoters or not, why have competitions? The abolition of competitions may, or may not, be a desirable reform; it is one that would doubtless please many architects who have few gifts for competitive work. But we do not expect such an outcome in our time; and, as far as present evidences go, competitive work is likely to increase in the future, rather than diminish. If our view be correct, it is the more necessary that the rules under which they are promoted should be fair and just to all the entrants. There is nothing wrong with the competitive system itself; the injustices and the difficultjes so frequently complained of are due entirely to pusillanimity and want of right feeling among the architects themselves. If architects boycotted all questionable competitions, and if assessors refused to act in any competition for which they had not drawn up proper conditions, these competition troubles would quickly disappear. It is idle to blame the system for the faults of the architects. But while some architects will eagerly compete where their more high-minded brethren refrain, and while, apparently, some assessors consider their fees of more moment than the conditions under which their fellow architects work, the evils will continue. On one point only are we in agreement with Mr. Creswell; that is concerning the nature of the conditions in many of the modern competitions. In nine-tenths of the competitions promoted, the only essential conditions are those of the site, the accommodation, and the cost. In a few cases there may be some special or local requirement which must be fulfilled. That such ridiculous conditions as the provision of a skylight to the Mayor's parlour, etc., to which Mr. Creswell alludes, are ever included, argues ineptitude on the part of the assessor. It is his duty both to his art and to his fellow artists to resist the inclusion of all such absurd and stultifying restrictions. For the same reason an assessor should refuse to assess any competition for which he has not drawn up the conditions. That architects should undertake to assess competitions at the eleventh hour, promoted under conditions which they strongly disapprove, or, in many cases, do not even trouble to read, is a great and crying evil. In such circumstances the selection of designs which transgress conditions deliberately laid down and insisted upon as essential, is an unendurable aggravation of the original evil. Mr. Creswell's contention that hard-working architects may be treated with cruel injustice in order to protect the public from the follies of its representatives, is not one that we can countenance. The cause of Architecture is a great one; but it will not be advanced by attempts to redress one grave wrong by committing another.

"Tremendous" Effects.

An American contemporary rejoices in the belief that, "to the lasting benefit of New York architects, Italian is becoming a more and more prevalent source of inspiration." Brick, in patterns and variations of colour, is, as we indicated in an illustrated article a week or two ago, being much employed; "and some of the best of the later buildings, such as the Brooklyn Academy of Music, the Home Club, the Lotos Club, have employed decorative treatment of the flat surfaces in brick with tremendous effect." We hope, not too tremendous! The Lotos Club is by Donn Barber, whose name is the more familiar to British readers from the illustrations of his work which have appeared in the "Architectural Review" and in the special issue of this Journal for December 31st, 1909. The height of this building is divided by balconies into three portions, the lowest of which is in stone, the second of brick simply treated, and the third of a very decorative brick surface; while the façade is surmounted by a "tremendously wide cornice, not so suggestive of Italy as of Spain." The writer seems to have so great a liking for the word "tremendous," that possibly it has not much more force than Dominie Sampson's "prodigious"; but the important point to notice is that brickwork of various patterns and colours is undoubtedly becoming very popular in America, and that the fashion may possibly be imported to this country. Would it satisfy Mr. Halsey Ricardo's demand for coloured frontages?

The Making of By-Laws.

When by-laws are in the melting-pot, architects and builders rightly insist on being allowed to take a hand in the recasting; and public bodies are usually aware of the many advantages of calling them into consultation. For one thing, it strengthens the position of the Corporation to say that the by-laws have received this expert approval. In too many instances this sanction is rather rushed. For instance, we hear that the Urban District Council of Handsworth, whose by-laws, being thirty years old, have become somewhat stale, had been for about six years considering a new set, but nevertheless seemed to consider that about the same number of days would afford ample time for the consideration of the revised laws by the Birmingham Building Trades Employers' Association. This period, upon protest, was slightly extended, but was still quite inadequate for anything like thorough examination of the proposals, which, however, were at once seen to embody changes that were open to strong objection by builders. Among these are some of the definitions. In that of mortar, the use of unslaked lime is required. The builders object that such lime could not be used in a mill. A further definition seems to exclude the use of lime concrete, which the builders contend is often quite sufficient for the purposes to which it is applied. Another, it is contended, lacks elasticity, and "would prevent any possible improvement in materials." This is certainly a by-law tendency that should be watched, as it has operated detrimentally in large matters as well as in small. Other items in the Handsworth proposals are objected to as being in restraint of trade; and, on the whole, we are strongly disposed to agree that the proposed new by-laws "need drastic amendment in order to make them reasonable." Similar objections are made against the new Birmingham by-laws, and in these, with respect to the composition of mortar, it is provided that the onus of proof of quality would be thrown upon the builder! It is questionable whether this provision would hold good in a court of

law. Exception is also taken to the requirement that all metal stanchions, in the case of any building exceeding one storey in height, shall be encased in not less than three-quarters of an inch in thickness of fire-resisting material; the objection referring to needless increase of cost in buildings, in which such precautions might happen to be entirely unnecessary. No fewer than six pages of the by-laws relate to the timbers of buildings, and the structure of the roofs of new buildings and floors, and specify the actual sizes of joists relatively to their length. To these and other rigid requirements the Birmingham Building Trades Employers' Association object because "they are excessive in their demands for sizes and strengths, and because the minute prescription of so many details will unnecessarily limit architects and builders in their work. Further new requirements are—that every boarded floor in a domestic building shall be so jointed that liquid cannot pass between the boards, and that water-closets in a building shall be so constructed that there shall be no doorway, window, or other opening into a habitable room. It is pointed out that this requirement, being somewhat ambiguous, might be subject to arbitrary and inconvenient interpretation by officials. The merits of these particular objections need not be here discussed. Our main point is that in the framing of by-laws it is not only necessary that the advice of architects and builders should be sought, but that such consultation should not be unduly hurried, and that it should be orderly and systematic. In some instances, corporations have taken the wise course of inviting architects and builders to join the committee charged with the duty of revision. Even then it is still necessary to submit the work of the joint committee for the consideration of properly constituted bodies of experts, and to afford ample time for exhaustive examination.

Fugitive and Perishing Particulars.

A sane view of art, for which we are duly grateful to a writer in one of the daily newspapers, is that it "is merely one of the forms in which the human spirit reveals itself. But," he continues, "it is not at any particular time the chief or even one of the most important of these forms. The institutions, customs, family arrangements, religion, laws, of any particular group of people are of infinitely greater importance to them than their art. But all these things, so far as they are merely facts of daily life, are fugitive and perishing particulars. The works of art alone remain." That they are not imperishable, and that, in fact, some of them hardly endure from one generation to another, does not affect the argument that, since they, as a rule, have a much longer existence than the human span, they should be created and finished in the full realisation that they will outlive the times and the trivialities of the little day in which they are conceived and executed. It is a point of view which the architect finds it very difficult to impose upon his clients, whether public or private, and it is a consideration that no doubt weighs heavily with those leaders of architectural thought who so strongly insist on faithful adherence to accepted principles of design, to the rejection of glaring innovations which, however faithfully they may reflect the mood of the moment, are for that very reason but little likely to withstand the test of time. A building should not be the embodiment of "fugitive and perishing particulars." The aim should be to make it a joy for all time.

The Deadly Hedgerow.

A point in town-planning, or in road development, to which we were among the first to draw attention, is the serious inconvenience of the picturesque corner, with its spreading tree and tall hedgerow. The subject, we see, has since received a great deal of attention in the Press, with particular reference to recent fatal accidents to motorists. Mr. Rees Jeffreys, secretary of the Motor Union, believes that a remedy will be provided in the Development and Road Improvements Act, which authorises contributions towards the cost of cutting down high hedges, of which he knows three or four thousand that make dangerous corners. There can be no doubt, we fear, that in this case, as in so many other particulars, picturesqueness and utility are incompatible. Unless the necessary clipping is done with restraint and discretion, our rural roads will lose their chief glory, and the countryside may be reduced to a deplorable condition of Dutch primness. We should be, however, the last to deny that picturesqueness can be held too dear; and it seems to us a point on which stress may be laid, that for the inevitable disappearance of much natural beauty, the architects are in duty bound to render the utmost possible compensation by the provision of the most beautiful buildings that their art can yield.

Restoration Extraordinary.

After seven years' work, the Campanile of St. Mark's, Venice, is now nearing completion, the shaft being finished, and the separate parts of the belfry being ready for placing in position. Excellent progress is also being made with the exceedingly delicate labour of reconstructing the Loggia di Sansovino. This, it will be remembered, was shattered to fragments. If such a thing had happened in this country, the débris would probably by this time have been used up as aggregate for concrete; but in matters of art, at all events, the Italians are a patient and a pious race. The "rubbish" was all carefully taken to the Doge's Palace, where the larger pieces were photographed with a view to reinstatement. The shattered statues by Sansovino—Minerva, Apollo, Mercury, and Peace—the bronze gate by Antonio Gai, and Sansovino's gilded terra-cotta group of the Madonna and Child, and his statue of St. John, have been marvellously restored. The group was broken into 1,600 pieces, and these have been put together by Pietro Zei, of the Archæological Museum of Florence, whose skill in piecing together had been already attested by his restoration of the famous Francoi vase. But, alas! even his sublime patience is unequal to the restoration of the head of St. John, which, with the shoulders, hips, and part of one of the arms, had been reduced to absolute powder. Perhaps it is all well worth while; but we feel sure that in this country such a task would never have been undertaken. But then we have here no Sansovino and no Pietro Zei.

Ornamental Leadwork Revived.

Interest in ornamental leadwork has been greatly stimulated by the publication of the fine book on the subject by Mr. Lawrence Weaver, F.S.A., which was noticed in our columns a week or two ago, and Mr. John E. Pritchard, F.S.A., in referring to Mr. Weaver's book as "a great work," did not use the language of exaggeration. The book is, in truth, remarkable for its rare combination of thoroughness, scholarship, and literary finish. Its position as the standard authority is assured, but we should certainly be surprised and disappointed to find that its value and importance are merely historical or archæological. It should be the herald and portent of a renaissance of leadwork in England. For some years past, a good deal of attention has been given to the subject in technological classes; and arts and crafts exhibitions usually include some more or less ambitious specimens of lead-bossing. The decadence of the art was no doubt due to the intense concentration on sanitary plumbing that resulted from the teaching and preaching of such hot-gospellers of sanitary reform as Simon, and Playfair, and Richardson, from which it was to be inferred that the whole duty of the plumber was to be crudely and emphatically hygienic. A strong prejudice arose in favour of perfectly plain surfaces in leadwork, and ornamentation was taboo. An enormous amount of rough pioneer work having been accomplished, the plumber has now more leisure for the study of refinements, and the scientific sanitarian is showing a disposition to moderate somewhat on his former insistence on uncompromising severity and simplicity in design. The almost superstitious dread of the slightest departure from sheer utilitarianism has given place to more discriminating views. Decorative leadwork, however, is not likely to become common—why not, Mr. Pritchard indicated in the course of a recent lecture delivered at a recent meeting of the Bristol and Gloucestershire Archæological Society. He described a lead head of exceptionally artistic design of the early Georgian period (circa 1720), which was taken from an old brick house, demolished in June last, opposite the Royal Infirmary in Bristol. "The beautifully moulded cherub's head, specially poised for the great height when fixed, first attracts one's attention, and then the circular ornament applied to the neck of the receiver just above the head, together with the well-defined mouldings, make it a truly pleasing work of art." Then comes the disconcerting comment that "nowadays similar requirement is generally supplied by a plain semicircular cast-iron snow-box, in value only a few shillings." Although ornamental leadwork cannot compete with cast-iron work where cheapness is the criterion, there is no reason why, in the increasing instances in which comeliness is the superior consideration, decorative leadwork should not find an ample field, whose expanse will doubtless be largely extended by the influence of Mr. Weaver's book, in which the examples illustrated prove conclusively that here the architect has a further valuable opportunity of adding considerably and characteristically to the many and varied charms of English domestic work.

OUR EDITION DE LUXE.

We are informed by our publishers that a few more copies of the Edition de Luxe of the "Builders' Journal" have now become available, and can for the present be supplied at the published price of 1s. net. Readers who have been unable to secure a copy of this valuable special issue, will be glad of this opportunity of obtaining a work that is admitted to be of unique and permanent interest. It contains a number of fine illustrations of current British work, and an important section is devoted to the most complete account of Modern American Architecture that has yet appeared in this country (140 illustrations). As the supply is limited, early application should be made.

UNIVERSITY OF ILLINOIS

ARCHITECTS OF THE DAY—X. MR. PERCY MORLEY HORDER, F.R.I.B.A.

Sketched from life by our Special Artist.

Architects of the Day.

X.—Mr Percy Morley Horder, F.R.I.B.A.

Mr. Horder, whose work is fairly well-known to our readers, is one of the best-known domestic architects practising in London. He was articled to Messrs. Devey and Williams, and commenced practice in New Bond Street, on his own account, in 1895. Mr. Horder denies that there is anything more to be said about his career, and, unfortunately, illness has prevented him from being interrogated on the details, a fact that Mr. Horder may possibly regard as a silver lining to the otherwise unpleasant experience of being unwell.

Mr. Horder is more particularly known and famed as an exponent of the smaller English house, and examples of his work may be found in the majority of the counties of England. Among them may be mentioned: House at Walton Heath; "Birchington," Bexhill; house at Ealing; house at Cheltenham; two inns, Stroud, Glos.; house at Maidenhead; house at Compton; cottage at Beaconsfield; house at Dorchester; house at Blandford; Belle Isle, Lough Erne, Ireland; cottage at Dursley, Glos.; house at Warwick; alterations to Waterson Manor, Dorset; chancel, Brixton Independent Church; house at Milford Haven; house at Norwich (with Mr. H. G. Wyand); house at Walton-on-the-Hill; Stone House, Hawes, Yorkshire, etc.

Of the examples illustrated in this issue, the house at Walton-on-the-Hill, Surrey, is built with grey bricks, with courses of red facings and tiles which give a pleasant broken texture to the walls. Special hand-made tiles cover the roof, and the gable on the north elevation is hung with tiles. The situation of the house affords an uninterrupted view right across the well-known Walton Heath golf links, and the garden has been designed by the architect to be in keeping with the house. The interior is quite simple in its detail. In the dining-room is a fitted sideboard and ingle-nook with seats; the general decorative effect being obtained by the use of wooden rails and mouldings dividing up the wall spaces into panels. The little tiled hall has the advantage of complete privacy, and forms the centre of the three reception-rooms.

The house near Dorchester has just been completed, and is on the road between Dorchester and Charminster. There is the greatest difficulty in getting any building land near the town of Dorchester, so there is very little choice in the matter of sites. This particular site commands a pretty view of Dorchester, but until the garden scheme becomes matured it is somewhat bare and forms no setting for the house.

The natural building material of this locality should be stone, but none of the local quarries are now available, and the expenses of cartage prohibited general use of the stone. Some rough local stone has been introduced into the porch, and as a base to the house—using this in large unsquared pieces, irregularly mixed with the rough-cast and red brick of chimneys in the old local manner. The roof is covered with special hand-made roofing tiles of a very beautiful colour.

The general arrangement of house, stable, and garden explains itself and calls for no particular comments, beyond pointing out the value of thus connecting up all the building and forming a pleasing quadrangular form. The walled kitchen garden is a particular feature of the scheme, and on a bare site of this kind adds greatly to the sense of settled occupancy and gives unusual variety and privacy to the kitchen wing. When the walls get naturally clothed with fruit trees and the lines of garden get more definite, the value of the general arrangements of the house and garden will be apparent. Holt and Son, of Croydon, were the general contractors. Ham Hill stone was used for the window frames, which are fitted with casements and leaded lights.

Stone House, Hawes, has the advantage of a very beautiful if bare site on the moor above Hawes village, and overlooks the celebrated valley of Wensleydale, Yorkshire, which runs on the upper course of the Ure river from Hawes to Bedale. The ground slopes up from the road, and the house is reached by a short straight drive, opening into a square forecourt enclosed from the main gardens by a dwarf wall. On the right of the forecourt is the motor-house and stable, connected with the house by a wall which forms one side of the forecourt, and through which the kitchen entrance is reached. Shrubs and trees have been planted plentifully to screen the gardens and house from the road, and to the south-west of the house a rose garden has been formed, and beyond it a tennis lawn, which has necessitated excavation on two sides to get the level.

The accommodation on the ground floor comprises a large square hall, flanked on one side by the dining-room and on the other by a boudoir Beyond this, reached by a short lobby, is the drawing-room, which opens on to the terrace. The walls are built of rubble stone, quarried locally, with dressings of West Yorkshire stone to the doors, windows, etc., and the roofs are covered with Yorkshire flags. The local style has been adopted as far as possible. The builder was G. R. Wade, of Wellington Place, Richmond, Yorkshire.

One of the particular features of Mr. Horder's houses is the attention paid to local building characteristics and the adoption of the local styles and materials. It has always been his endeavour to preserve in his buildings the local traditions, and this fact has, no doubt, been largely instrumental in contributing to their artistic success.

DINING-ROOM, HOUSE AT WALTON-ON-ON-THE-HILL, SURREY. P. MORLEY HORDER, F.R.I.B.A., ARCHITECT.

The dining-room has a fitted side-board and ingle-nook with seats, the general decorative effect being obtained by the use of wooden rails and mouldings divided up the wall spaces into panels.

CARR OF YORK.*

[By S. D. Kitson, M.A. Cantab.

The work of Carr of York is not well known, and has escaped the attention which has lately been given to the architecture of the eighteenth century. Carr's work is dull and uninspired. He was a busy and highly successful man.

The village of Horbury, near Wakefield, where John Carr was born in 1723, appears to have always been of some considerable size, and to have supplied its own wants. For the parish registers, which have been printed, record the names of workmen in many trades, weaving and building being the most numerous. The Carrs seem to have been masons for at least five generations; and John Carr was the son of Robert Carr, mason, who again was the son of John Carr, mason, and so on. Michael Angelo used to attribute his aptitude for sculpture to the fact that his foster-mother was the wife of a stone-cutter at Settignano; with far greater force could young Carr claim that his career was settled for him by hereditary circumstances.

After passing through the village school, young Carr was early set to work either in the quarry at Horbury which his father owned, or upon buildings, such as Chevet Park and Bretton Hall in the neighbourhood, on which his father was engaged as master-mason. Stories have been preserved which illustrate his youthful ability and accuracy. When the other masons engaged on a piece of work had all failed in setting it out correctly, Carr's father said, "Let the lad have a try," and young Carr successfully solved the problem. Again, before starting from home on a Monday morning for his week's work his mother would provide him with a large circular meat pie; Carr would divide this with his mason's compasses into six exactly equal parts.

Sometime before the year 1750 Carr removed to York.

In 1754 a grand-stand on the Knavesmire was designed and built by Carr. It was a broad and simple piece of Palladian design, and it gave the greatest satisfaction to his patrons. Lord Rockingham, who was the chief promoter, was delighted with it, and remained a good friend to Carr throughout his life, and the other country gentlemen who appreciated the amenities of the grand-stand followed his example and engaged Carr as their architect to the exclusion of anyone else.

Henceforward Carr seems to have ceased to practise as a master-mason, and to have become solely a designer of buildings. How did he gain the necessary knowledge, skill and experience to fit him for his new role? In his youth he had seen the straightforward work which James Paine was doing in the West Riding, and on his arrival at York he had the advantage of carrying out work under Lord Burlington and one of his professional architects. If the numerous pattern-books then existing and his own shrewd common sense are added to these qualifications, we have the whole of the equipment with which Carr started on his architectural career. His training equally explains the severe limitations which are so noticeable in his designs, the excellence of his masonry, and the practical character of his planning.

The first houses which Carr designed were in York itself; large red brick buildings which still look solemnly out into the narrow streets and rather dwarf their medieval neighbours. There are two such houses in Castlegate. One is built up to the street and contains elaborate plaster ceilings which show that Carr had ready to his hand at York an accomplished group of plasterers, schooled, probably by Lord Burlington, in a type of design which owed a great deal to French influence. The other house in Castlegate stands back from the street, and it is a happy example of Carr's "solid, masculine and unaffected" style. In Halifax there exists, though now much mutilated, the great establishment which Carr built for Mr. Rawson, banker and merchant. He dwelt in the centre part, and on one side was his bank, on the other side his warehouse. The large windows in the centre mark the parlour, decorated with plaster work in the florid George the Second manner.

There are two buildings which form the most important turning-points in Carr's career: the first was the grand-stand on the racecourse at York, the second was Harewood House, which he built for Mr. Edwin Lascelles. It brought him into contact with the Brothers Adam. Henceforward his work loses in robustness what it gains in "elegance."

A little higher up the river Wharfe than Harewood Carr built Denton Park, a typical example of his larger houses, with wings attached. The masonry is faultless, the design cold, regular and uncompromising. There is the usual entrance on the south front direct into a large square hall. Carr never built a porch to his entrances. There is his favourite device of a bay window extending the whole width of the room and balanced on the other side by chamfered angles, in which, when the room was intended for a dining-room, the side-boards were placed.

In the interior decoration of Denton, Carr had thoroughly assimilated the manner of the Brothers Adam, and his ceilings, door architraves and mantelpieces can hardly be distinguished from theirs. These rooms when sparsely furnished, with polished floors and lighted by wax candles, must have suited exactly the atmosphere of the time. But they were comfortable rooms also, for Carr never tried experiments, and his experience made every detail exactly right, whether it was the height of the window-sill or the size and position of the fireplace..

Basildon Park is the only example of Carr's work in the south of England. It was built for a Yorkshireman, Sir Francis Sykes.

One of the latest examples of Carr's domestic work is Hackness Hall, near Scarborough. It is one of the largest houses of his single-block type, but beyond a greater tendency to refinement of detail, due to the Greek revival fashion, and an unhappy attempt to broaden his windows, it is similar to the work he was doing thirty years earlier. The house itself is a fine example of mason's work, as is the case with all Carr's buildings. He was always at the greatest pains to select the very best stone and to use it with knowledge and judgment. For buildings in the neighbourhood of towns, he seems in several cases to have preferred brick. In Wakefield, for example, so near to his native village where he had learnt his mason's craft, he is responsible for some of those great plain, comfortable-looking brick houses in Westgate. Carr also made additions to many existing houses, to the Elizabethan Farnley Hall, and to the late eighteenth century Wentworth Castle, for example. But he never attempted to introduce any other style than his own. He planted down his additions exactly as and where practical requirements dictated.

The stables of an eighteenth-century Yorkshire establishment almost rivalled the house itself in importance. At Wentworth House Carr designed for his early patron, Lord Rockingham, what were perhaps the most magnificent stables in Europe. They are built round a quadrangle and entered through a fine gateway of the Doric order. Within all is spacious and substantial, the mangers are niches of solid stone. This building shows Carr at his best; it is work of the simple broad type in which he delighted, and with which he was very much at home.

Carr was for long an alderman, and on two occasions Lord Mayor, of York.

The portrait of Carr by Sir William Beechey shows him as a genial, shrewd and kindly old man.

The Court House and Debtors' Prison at York, which face each other on either side of the Castle Green, and which are precisely similar in design, form the only opportunity which Carr was given in York for regular and formal grouping. The plan of the Court House was modelled upon that of the basilicas of ancient Rome. The central doorway opened upon a columned hall, and at either end were two courts of justice, the civil court on one side and the criminal court on the other, each surmounted by a dome containing elaborate plaster work. Originally the building was open from end to end, and the effect must have been very stately. Unfortunately the various parts of the building have now been partitioned off; a development which was inevitable in view of the historic horror of draughts which is a characteristic of the judical temperament. The town halls of Lincoln, Newark, and Chesterfield, show Carr's usual careful treatment, and form an appropriate setting for the slow, deliberate municipal life of the period. In 1790 Carr obtained permission to pull down the village church at Horbury, where he had worshipped as a boy and where so many of his ancestors lay buried, and to build an entirely new church of classic character at his own expense. He had been successful in his work, he had amassed a large fortune, and he had been twice Lord Mayor of York. So in his native village—with mixed motives of piety and pride—he built the existing church at Horbury.

HOUSE AT WALTON-ON-THE-HILL, SURREY. P. MORLEY HORDER, F.R.I.B.A., ARCHITECT.

*Abstract of paper read before the Royal Institute of British Architects, January 17th.

Carr made occasional excursions into Gothic, and the aisles of Dewsbury Church and the east part of Sheffield Church show that he neither understood nor appreciated Gothic architecture. His original drawings exist for the work at Sheffield Church. At the Soane Museum there is a bound set of drawings copied from Batty Langley's work on Gothic architecture, and on the frontispiece of this Carr's name is written. Whether or not Carr made these copies himself, the drawings for Sheffield Church show that he had been a student of Batty Langley's works. Carr also made a survey of York Minster for Dean Fountayne. He restored the roofs, employing as his clerk of works the son of the Archbishop's gardener, Joseph Halfpenny, who took advantage of the scaffolding to make those careful drawings which were afterwards published as "The Gothic Ornaments of York Minster."

The last work that Carr designed was the entrance gateway to Harewood Park. It dates from 1801, and is a fine piece of mason's work. In 1791 he was elected one of the nineteen original members of the London Architectural Club, who used to meet once a month at the Thatched House Tavern. He died in 1807 at the age of eighty-four.

Discussion.

Mr. J. A. Gotch proposed a vote of thanks, and said that Mr. Kitson had marshalled together a complete set of invaluable facts relative to the history of Carr of York. A slight injustice had been done, however, inasmuch as the lecturer made no reference to the work of the early seventeenth century. The hills and dales of Yorkshire offered rare examples of mullioned buildings, which were admirably suitable to the surroundings. The history of Carr was particularly interesting, he being one of the last mason-architects who did so much to fill England with the beautiful buildings which now exist. Usually at the time when Carr flourished, the mason was responsible for the details, if not for the planning. They had in Carr one who combined with eminent success the qualities of architect and mason. The fact that Carr was only thirty-one years of age when he designed the grand stand at York, prompted the reflection that far less training was required in those days than at the present time. Recent decisions in the law courts emphasised the heavy responsibility that rested with the modern architect, the question of dry rot being a case in point. Carr of York was entirely free from these minor troubles, and his simple training was quite sufficient for the requirements of the time. Sanitary equipment then being something which was never installed, no house had an ignoble side, but all fine façades. It was no disadvantage, in the speaker's opinion, to approach the house of the seventeenth century through the large courtyard, which was invariably a feature of the design, and was almost always occupied by servants. Plans, and the elements of design were simple, and the pattern books of the time were of immense assistance to the architect in the design of a house, perhaps to the disadvantage of architecture. To-day we suffered, perhaps, too much from originality, whereas in the old houses nothing was unexpected. When, however, one turned round the corner of a house nowadays, one was sure to find something unexpected. Perhaps the wish that it hadn't been found followed the encounter. Mr. Gotch then asked Mr. Kitson if Carr designed any work in 1806. He believed that at Wentworth House he designed the stables (Mr. Kitson: "Wentworth Castle, not Wentworth House."). Burton Constable, continued Mr. Gotch, was a mullioned house, totally different from Constable Burton. What curious people the Yorkshiremen were to get two such important houses so thoroughly confused. An extant drawing of Harewood House in its original state showed a good conception of the English country house. Quite as important to Capability Brown, however, was the landscape in which the house happened to appear. Concluding, Mr. Gotch quoted Carr's admirable ambition, which was deserving of emulation, to "arrange the necessary conveniences with some degree of art."

Mr. H. Avray Tipping seconded the vote of thanks, and compared with Carr of York, Smithson, the Tudor architect of Wollaton, who was also a mason. Smithson, in company with many other architects of the period, derived his knowledge from the workshop rather than from the drawing board. Carr carried on tradition: but it was a tradition without originality. He always belonged to the pattern-book class of architect, which commenced with Inigo Jones. In his concluding remarks Mr. Tipping suggested that a paper dealing with Smith of Warwick, an architect very similar to Carr, would make interesting and instructive matter.

Mr. H. H. Statham supported the vote of thanks, and observed that Elmes' idea for St. George's Hall, Liverpool, was, he had learnt from a resident of that city, a large hall with a vista, and accommodation for a judge at either end. The external staircase the speaker considered the finest feature of the 18th century house, and would be glad to see it revived in modern work. Referring to the profile portrait of Carr by Dance, Mr. Statham recalled the Loan Exhibition at the Royal Academy, where a number of Dance's sketches of his friends were shown. The personal equation was largely to be observed in this work, for they were all alike.

Mr. E. Guy Dawber remarked upon the peculiar interest attaching to local architects, of whom Carr was a good example. Stamford bore the indelible impress of one man, even as Bath clearly showed the stamps of Nash and Adam. Henry Bell, again, of

HOUSE AT WALTON-ON-THE-HILL, SURREY. P. MORLEY HORDER, F.R.I.B.A., ARCHITECT.

The interior is furnished very simply. The little tiled hall has the advantage of complete privacy, and forms the centre of the three reception rooms.

Lynn, who was born in 1650, was one who had left a personal impression upon the town. In 1683 he built the Customs House at Lynn, and when, at the age of thirty, the building was completed, it marked him as a master of architecture.

Mr. Arthur T. Bolton observed that a notable feature of buildings designed by the mason-architect was their extraordinary similarity. When, however, the influence of a trained architect was felt, a marked change took place. The plasterwork in many of Carr's houses was probably executed by the men employed by the brothers Adam.

Mr. Kitson, in reply, said he was much obliged by the way in which his paper had been received. Dealing with Mr. Gotch's point, he said he believed that Mr. Gotch came from Rutland, where it would be impossible to have two houses with the same name. Constable Burton was a house built by Carr. He had it on the authority of the present owner, whose ancestor was in possession of the house at the time that Carr was called in to do some trifling alteration to the kitchen range. When he returned he found that the old house had been cleared away and a new mansion erected in its place. Personally, he would not vouch for the story. Burton Constable was an Elizabeth in mullioned house, in which complete plans prepared by Carr for its Palladianisation were found. The new design fortunately had not been carried out.

Correspondence.

The Effect of Fire on Cast-iron.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—To those interested in the safety of buildings largely constructed of ironwork, an object lesson was afforded in the recent great fire at Clapham Junction, when the unprotected steel work caused the downfall of the structure. I happened to be an eye witness of the disastrous fire which occurred at the large drapery store in Kilburn, reported in your last issue, and was particularly interested in the fate of the cast-iron stanchions which supported the superstructure. The whole of the upper part of the front of the shop where the fire broke out was carried by a girder between the two party walls, and supported in the centre by a 9-in. cast-iron column, uncased, and for over four hours this column bore a terrific heat from blazing linoleum, combined with the stress caused by the tons of water poured on it by the firemen, without any apparent effect, whereas some rolled-iron stanchions of I section behaved very badly. I noticed that the girders were encased in match boarding, which caused the fire to spread rapidly and ultimately the girders sagged, causing the floors, roof, and part of the front wall to fall. The conclusion that one can draw from this demonstration is that cast-iron is more reliable when used for stanchions or columns, than wrought iron of I pattern, as the latter seems to present a greater surface for the fire to play upon. There are many buildings quite newly built in which the whole of the superstructure is carried by a few stanchions, quite unprotected from the effects of great heat, and it makes one shudder to think of the fate of the occupants of these tall buildings should a fire break out in the closely packed shop beneath them.

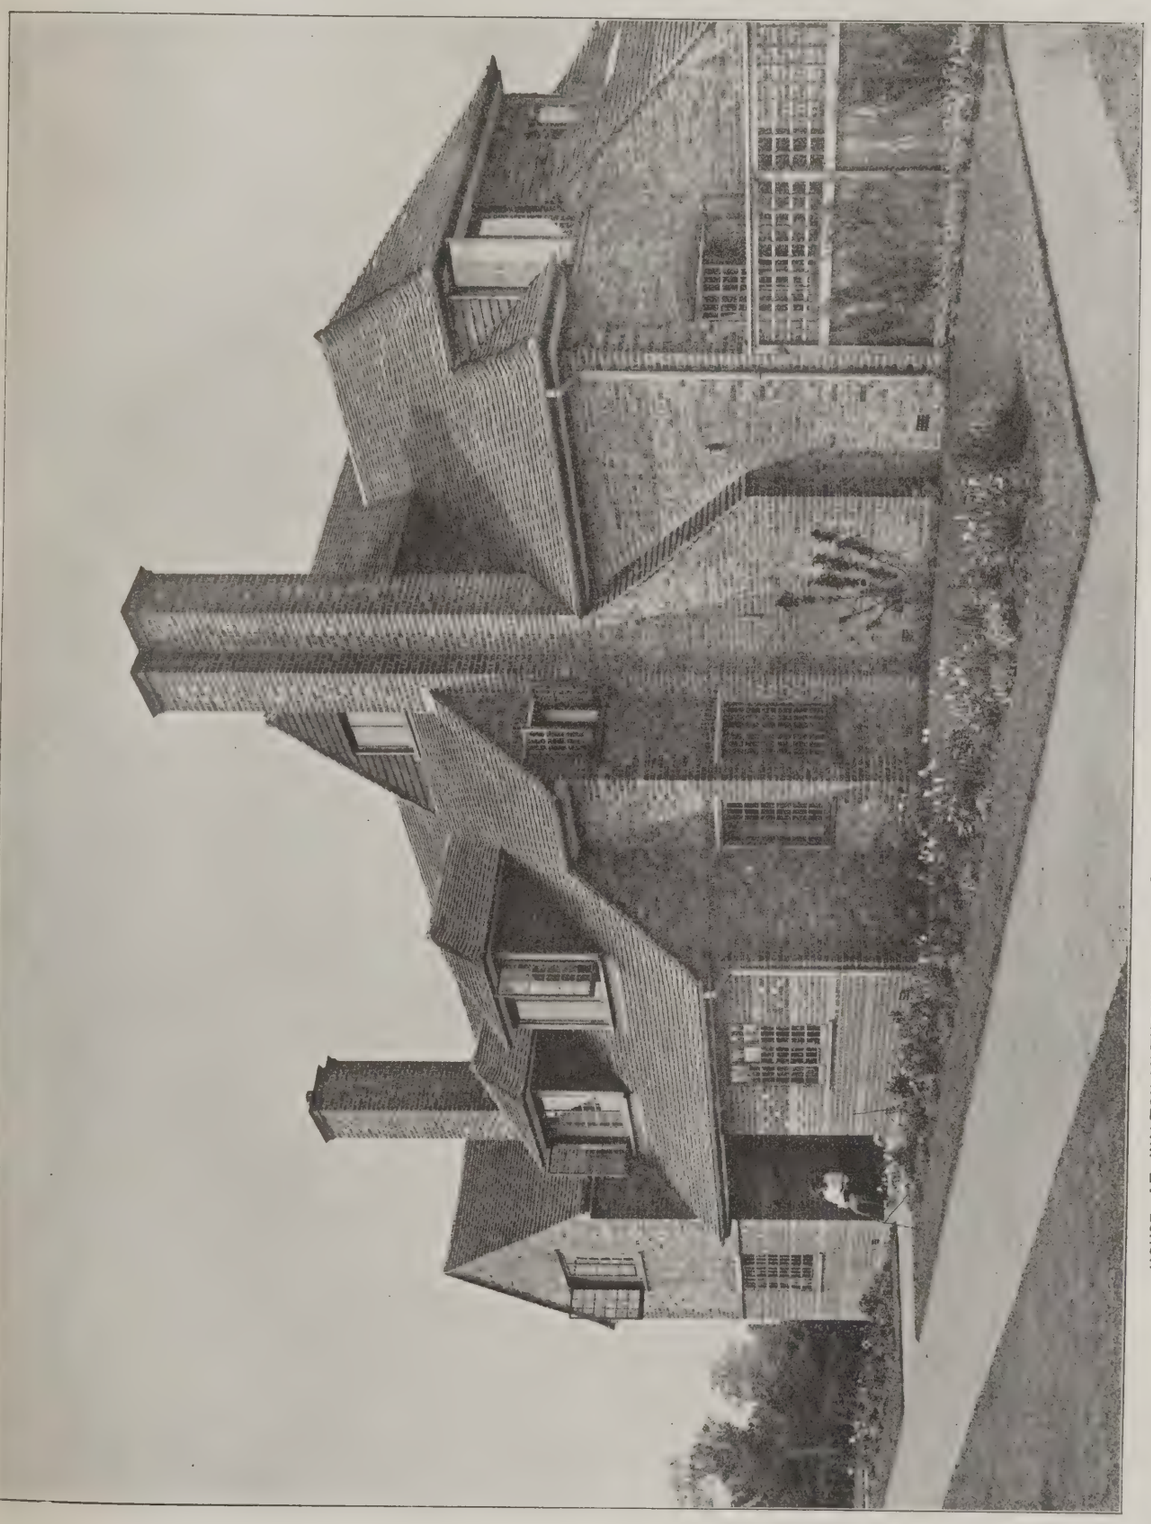
J. F. BURKINSHAW.

[Our correspondent makes an interesting point from a particular case. It has been the general experience, however, that cast iron is a treacherous material under fire stress, and the application of water to red-hot cast iron has caused it to "fly" with disastrous results. It would be interesting to know whether this particular stanchion became red-hot, or whether the "tons of water" referred to by our correspondent were not applied for the purpose of keeping it cool.—EDITOR.]

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.



DATE OF DELIVERY.	COMPETITION.
Jan. 31.	NATIONAL MUSEUM OF WALES. The Council desires to receive competitive designs for the erection of a new National Museum at Cardiff. Three premiums are offered of £200, £150, and £100, for second, third, and fourth. The Council have appointed Sir Aston Webb, R.A., Mr. John J. Burnet A.R.S.A., and Mr. Edwin T. Hall, F.R.I.B.A., as Assessors. Particulars and plans of the site will be supplied to competitors on payment of a fee of £2 2s., returnable if all papers are returned within 14 days. Inquiries to be addressed to Dr. Wm. Evans, Hoyle, Director of the Museums. City Hall, Cardiff.
Jan. 31.	PEMBROKE (Co. DUBLIN) LAYING OUT HERBERT PARK. The U.D. Council invite schemes with estimates of cost, for the laying out of above public park, which is about thirty-five statute acres in extent, within their district. A premium of £50, which is to include all expenses, will be paid to the person whose scheme may be selected. All plans, estimates, etc., sent in by the successful competitor to become the property of the Council, The Council will not be liable for any payment to a competitor, other than the above premium to the successful party. A plan of the lands as now existing can be obtained from on and after Monday, 3rd January, 1910. J. C. Manly, Clerk to the Council, Town Hall, Ballsbridge, Pembroke, Co Dublin.
Feb. 1.	OLDHAM, EXTENSION OF THE TOWN HALL. Restricted to Architects practising or residing in the Borough. Premiums of £50, £30 and £20, for the three designs placed 1st, 2nd and 3rd, and a sum of £5 will be paid to all unsuccessful competitors who send in a complete set of plans in accordance with the instructions. Plan of site, with instructions and suggestions for architects obtainable from E. C. Foote, Borough Surveyor, Town Hall, Oldham. Deposit: 21s.
Feb. 8	POSTER FOR THE A.A. PLAY, 1910. The Committee invite designs for a poster illustrating this year's play. A prize of one guinea will be given to the author of the selected design. Full particulars may be obtained from Mr. Percy Lovell, 23, Old Queen Street, Westminster, S.W., to whom designs must be sent in by first post on date named. A jury of three will assess.
Mar. 1.	GLAZED BRICKWORK DESIGNS AND ESSAYS. A committee of glazed brick manufacturers invite designs for works to be executed in glazed brickwork, also essays as to the advantages to be derived from the use of this material in accordance with conditions to be obtained from J. Johnston Green, 142, Liverpool Road South, Southport. Premiums of 100 guineas, 50 guineas and 25 guineas awarded to designs and essays jointly. Assessor Mr. Max Clarke, F.R.I.B.A., appointed by the President, R.I.B.A.
Mar. 31.	SHEFFIELD: ENDCLIFFE PARK CHURCH. Plans desired for Church for 650, Institute for 150, Primary Department for 125, Junior Department for 95, and Caretaker's Apartments. Premium, not merged in commission, £35. Assessor, Chas. Hadfield, Esq., F.R.I.B.A. Questions until February 10. Delivery on March 31. On receipt of 5s. the Secretary, J. W. Nicholls, 64, Everton Road, Brocco Bank, Sheffield, will furnish conditions and instructions, with plan of site, showing existing buildings, levels and drainage—these not returnable. Deposit returned only to those who send plans.
May 31.	MUNICIPAL OFFICES, KARACHI. The Municipality offer a premium of 7,500 rupees (£500) for the best design, detailed plans and estimates for new Municipal Offices. Cost not to exceed 500,000 rupees, and the style of architecture is left open to the designers. Ferrotype plans of the site and a general arrangement of the floors of the building showing the accommodation to be provided, together with a copy of instructions to architects, will be supplied to intending competitors on application to the Chief Officer and Chief Engineer, Karachi Municipality. A charge of Rs. 5 will be made therefor, which will not be refunded. Each set of drawings must be sent in anonymously, but accompanied by a sealed envelope containing the author's name and address. Each set of drawings and all the documents required, including the sealed envelope, must be securely packed in a wooden box addressed as follows:—The Chief Officer and Chief Engineer, Karachi Municipality, Karachi, India, and forwarded, at the competitor's own risk and charges, in time to reach the Chief Officer on or before the 31st day of May, 1910. It is proposed to apply to Government for permission for one of the chief architects to act as assessor to decide on the design to which the prize shall be awarded. The decision of the assessor will be final and not be open to dispute. The decision of the Municipality will be made within three months of the latest date for submission of designs, and payment of one-half of the premium will be made thereafter to the author of the selected design, the balance to be paid when the further details specified in the instructions to architects have been supplied. On payment of the premium the Municipality will have all rights in the design, with power to erect the building under its own agency, either according to the design selected or with such additions or alterations as it may deem necessary.

Carnegie Library and Technical School, Tralee.

The successful competitor in the above competition was Mr. W. T. Clarke, A.R.I.B.A., of Bank Buildings, 60, Castle Street, Liverpool. Messrs. O'Callaghan and Webb, of Dublin, took second place.

Wood Green Public Baths Competition.

Some months ago the Wood Green Urban District Council invited architects with experience in the design, etc., of baths to send in their names with particulars of such experience, giving details of the baths in the design and construction of which they had been engaged. As a result, 15 architects were invited to send in competitive designs, premiums of 50, 25, and 15 guineas respectively being offered by the Council to the authors of the designs placed first, second, and third in the order of merit by the assessor. The result of the competition was that the assessor disqualified all the designs submitted upon the point of cost alone. In the conditions it was stated that "the Council are most anxious that the inclusive and completed cost of the buildings shall not exceed eight thousand pounds." In order to avoid rendering the competition abortive, and to save time, the Council eventually adopted the recommendation of the assessor, that under the circumstances the author of the design he considered the best, apart from the question of the cost, should be appointed architect to the work, subject to his reducing the cost of his design to the amount stipulated in the conditions of the competition. The author of the selected design is Mr. Harold Burgess, of West Green, South Tottenham. The second and third premiums have been awarded respectively to Mr. E. Harding Payne, of 11, John Street, Bedford Row, W.C., and Messrs. Francis J. and F. Danby Smith, of Parliament Mansions, Victoria Street, S.W. Mr. Burgess has been asked to proceed at once with the matter. The quantity surveyors are Messrs. Young and Brown, of 104, High Holborn, W.C. It will be recollected that the Council retained Mr. A. Hessell Tiltman, F.R.I.B.A., of 2, Verulam Buildings, Gray's Inn, W.C., as assessor and consulting architect. The assessor, in his report, considers that the first premiated design "is by far the best in arrangement, construction, and design, both externally and internally, whilst it offers the best opportunities for such modification in size as would enable it to be carried out for the stipulated cost." He recommends the shortening of the swimming pool by 10ft., and corresponding modifications. It was originally required to be 100ft. long by 30ft., and the spectators' gallery was to seat nearly 500 persons, and there is to be a club-room of some 250ft. area opening out of the swimming bath.

HOUSE AT WALTON-ON-THE-HILL, SURREY: GARDEN FRONT. P. MORLEY HORDER, F.R.I.B.A., ARCHITECT.

This house is built with grey bricks, with courses of red facings and tiles which give a pleasant broken texture to the walls.

HOUSE AT WALTON-ON-THE-HILL, SURREY: ENTRANCE FRONT. P. MORLEY HORDER, F.R.I.B.A., ARCHITECT.

Special hand-made tiles cover the roof, and the gable on the north elevation is hung with tiles. The house has an uninterrupted view across the well-known Walton Heath Golf Links.

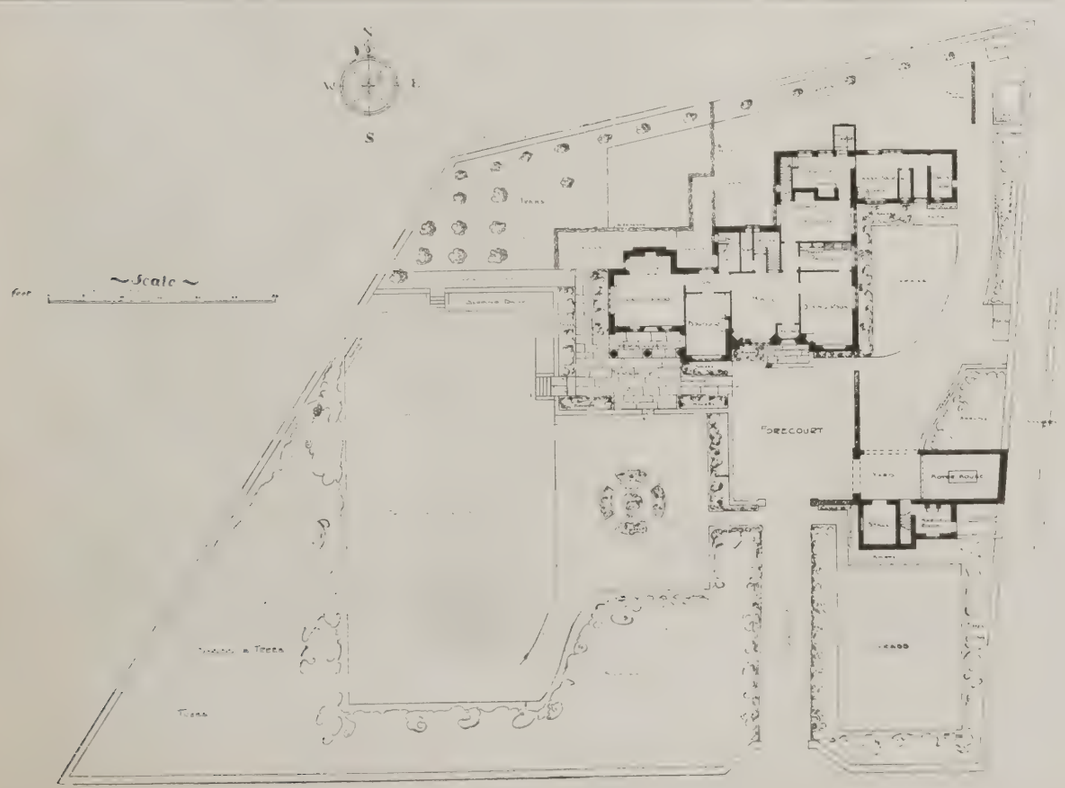
BUILDING INTERESTS IN THE NEXT PARLIAMENT.

Petitions for 113 English private bills and 19 Scotch provisional orders were deposited in the Private Bill Office in December, which is a falling off from last year to some extent, and a very considerable decrease on the figures of five years ago. Already five of the Bills have been abandoned, so that whilst there are still left a good number of important measures yet, the members of the new Parliament will not be overburdened with work. The following summary will give some idea of the constructional works which are proposed:—

Railways.

Estimates have been prepared by various engineers for new railway works totalling to close on £3,000,000. A few years ago new tube and other railway schemes were numerous, and the estimates amounted to an enormous sum. In the present year, whilst the estimates are comparatively small, it should not be overlooked that in the case of existing companies only absolutely necessary works are projected, and consequently if the Bills are passed the work will be carried out. The largest contemplated expenditure is that of the Lancashire and Yorkshire Railway Co., amounting to close on £800,000, of which about half is needed for the extension of the Exchange Station at Liverpool. The balance goes in widenings of various parts of the system. The Great Central Railway Co. contemplate spending £433,000, the bulk of which will go on a deviation railway at Keadby, where a new bridge will be built over the Trent. The Great Western Railway will spend £118,000 chiefly on bridge extensions; the Great Northern Railway of Ireland £125,000; the Stratford-on-Avon Midland Junction Railway £2,500; Caledonian Railway £9,000; the Barry Railway £67,830; the Taff Vale Railway £900 (on a footbridge at Pontypridd); and the Midland Railway £18,000. The Baker Street and Waterloo Railway purpose spending £1,700 on a subway at Oxford Circus; the Metropolitan Company to construct subways at Edgware Road and Moorgate Street; and the Metropolitan District Railway to make a railway from Acton to Chiswick at a cost of nearly £300,000. This company also seek power to reconstruct and enlarge their Temple and Charing Cross Stations. There is one Bill for the incorporation of a new company to make a railway in the London district, and three for new companies to construct railways in the provinces. The first, which is the Wimbledon and Sutton Railway Co., asks for capital powers of £350,000, and amongst the first directors will be Mr. H. D. Searles-Wood. The provincial companies are the Coventry Railway Co., with a capital of £200,000, to make a line from Coventry to Whitacre; the Mansfield Railway Co., with a capital of £250,000, to make railways in Nottingham; and the Trent Railway and Bridge Co., with a capital of £150,000, to make a railway from Garthorpe to Aldborough. Of the remaining railway bills, for which no estimates have been prepared, it may be noted that the North and South Shields Electric Railway Co. ask for a revival of powers to construct a railway under the Tyne, and the North East London Railway, which some years ago was authorised to make a railway from the City to Waltham Abbey, are seeking powers to make agreements with the Metropolitan Company regarding the construction of the line.

Docks, Harbours, and River Works.



There is no dock scheme of first-class importance such as the Wembley and Southampton Bills of last year, and in fact only one really complete work is proposed, viz., the St. Austell and Pentewan Dock and Railway. By the Bill a company is to be incorporated with a capital of £300,000, to acquire and work the existing Pentewan Dock and Railway, and to make a new dock and entrance with piers or breakwaters. Sir J. W. Szlumper, the engineer, estimates the cost of the new works at £211,118, of which £86,401 is for the new dock. The Saint Just-in-Roseland Docks Bill enables the promoters to make experimental soundings and borings with the object of ascertaining and determining the practicability of making deep sea water docks at St. Just. The Kirkcaldy Corporation take power to borrow £26,500 for the completion of the harbour works, whilst the Commissioners of Padstow Harbour ask for authority to make a new pier or jetty, at an estimated cost of £23,000. The Tynemouth Corporation wish to borrow £20,000, and to erect warehouses, etc., at the fish quays. Of river works the Southampton Corporation seek to make a river wall and road in the parish of All-Saints at a cost of over £55,000; the Warrington Corporation propose constructing two bridges over the Mersey at a cost of £65,200, and to make approach roads, etc., at a cost of £54,882. The River Don Board intend constructing works to bring about a more economical abstraction of water from the river for manufacturing purposes.

Water Bills.

There are 25 Bills dealing with water matters, and four Scotch provisional orders, and the estimates which have been deposited of proposed expenditure on mains, reservoirs, land buildings, etc., are as follows:—Staffordshire Potteries Water, £198,033; East Grinstead, £19,000; Exmouth Urban District Council, £18,012; Pontypridd and Rhondda Joint Water Board, £407,000; Fylde Water Board (which supplies to Blackpool, Fleetwood, Lytham, and St. Anne's), £212,000; Thorne and District, £12,495; Cambridge University and Town, £167,500; Hastings Corporation, £128,486; Aberdeen Corporation, £1,396,000; Maltby and Tickhall, £6,205; Abertillery and District Water Board, £247,000; South Hants, £16,500; Clydesbank and District, £61,770; Mountain Ash, £74,765; Whitland, £3,278; Fraserburgh, £45,870; Montrose, £24,390. The Slough, the Kingswood, the South Lincolnshire, and South End Water Companies are each seeking to extend their present areas of supply, and to raise fresh capital, which will, of course, be ultimately expended on new works. One of the most important bills is that of the Pontypridd and Rhondda Joint Board, which, if authorised, will mean the purchase of the undertaking of the Pontypridd Water Co. by the new authority.

Gas Bills.

Gas Bills are as usual fairly numerous, and there are proposals for several new com-

STONE HOUSE, HAWES, YORKS: GROUND PLAN. P. MORLEY HORDER, F.R.I.B.A., ARCHITECT.

STONE HOUSE, HAWES, YORKS: FROM THE ENTRANCE DRIVE. P. MORLEY HORDER, F.R.I.B.A., ARCHITECT.

The entrance from the road is by means of a straight drive with a square forecourt. On the right is the motor-house and stable. The house, as far as possible, is built in the local Yorkshire style. The kitchen entry is through the connecting wall between the house and stable.

panies, which will mean the expenditure of capital on constructional and other work. New companies are proposed for Garnant, with a capital of £18,000; Maltby, with a capital of £24,000; and Chipping Norton, £12,000. Extensions of present areas of supply are asked for by the Exmouth, Shirebrook, Ammanford, and Gowerton Companies, and further capital powers are sought by the Bristol, Exmouth, Farnham, Great Grimsby, Mallow, Bishops Stortford, Wicklow, and Tipperary Gas Companies. The Corporation of Middlesbrough seek powers to spend £50,000 on their gas undertaking; Matlock Bath Urban District Council, £5,000; Egremont U.D.C., £14,800; and the Falkirk Corporation, £50,000. Forty-seven gas companies have combined, and are seeking to have the Metropolitan Argand burner No. 2 made the standard burner for testing in their various Acts.

Tramways.

Proposals for new tramways are few in number, and are as follows:—London County Council, £955,000 for tramways and £640,000 for street widenings; Dunfermline and District, £123,500; Wemyss Extensions, £62,636; Bradford Corporation, £120,036; Handsworth Urban District Council, £75,700; Rhondda Urban District Council, £69,768; Nottingham Corporation, £74,444; Leeds Corporation, £14 000; Southampton Corporation, £11,980 for tramways and £24,747 for street improvements; Kirkcaldy Corporation, £9,000. The Bradford Corporation seek powers to run tramways on the railless trolley system.

Miscellaneous Proposals.

Amongst the remaining proposals the London County Council ask for power to widen Church Street, Kensington, and divert and widen Belvedere Road fronting the proposed new county hall; to deal with smoke nuisance in the Met.; to obtain an extension of time for the completion of the widening of Southampton Row; and to enable the Camberwell Borough Council to acquire land for public baths in the Crystal Palace Road. The Bradford Corporation asks for authority to borrow £35,000 for an extension of the Town Hall. Estimates have been prepared for an expenditure of £59,500 by the Cleethorpes Urban District Council on sewage works, and Wishaw will spend £20,200 on similar work. Edinburgh Corporation have an important scheme for the establishment of an Improvement Commission to deal with the disused canal and basins at Fountain Bridge. The Commissioners are to be empowered to fill up the canal and basins and formulate building schemes "which shall conduce to the sanitary conditions, the architectural and other amenities of the area." The Worksop Urban District Council seek powers to erect public buildings on land already held by them. By the St. James Vestry Hall, Westminster, Bill, the City Council will buy out the rights of the Rector, who will be authorised to devote the £2,000 paid to him towards the erection of a mission church on part of the churchyard. Two Bills deal with public buildings, viz., the National Gallery and the Duke of York School Chapel, Chelsea. By the first it is proposed to acquire buildings on the west side of the gallery, and by the second to demolish the chapel and apply the site to any secular purpose deemed expedient. The Middleton Corporation propose spending £30,000 on a public hall and offices, £12,000 on public baths and washhouses, £14,556 on street works, and £3,000 on a mortuary chapel. Should the Crystal Palace Bill be carried, and the £75,000 as proposed, raised, a considerable portion of that sum is to be expended on repairs to the buildings. Blackpool Corporation ask for authority to acquire and improve the North Shore Baths at a cost of £10,000.

Building By-laws and Sanitation.

The Corporations of Eastbourne, Hastings, Middlesbrough, Middleton, Southampton, Warrington, and Bradford, and the Urban District Councils of Worksop, Surbiton, and Handsworth are each seeking additional powers for the making of regulations in respect of building and sanitary matters, relating to such things as defining the future lines of existing streets, the provision of means of escape from buildings used for other than private residential purposes in case of fire, the rounding off of corners, the prevention of *culs de sac*, the provision of intersecting streets, etc. Middleton, Warrington, and Worksop each lay down what shall be the minimum floor space in certain rooms in new houses as follows:—One living room of not less than 115 square feet, one bedroom of not less than 110 square feet, and no bed or habitable room of less than 70 square feet. The Bradford Corporation take powers to permit the laying out of any area in the City on the garden city principle; the Surbiton Urban District Council have a rather complicated Bill defining what a sewer shall be in the district; and the Southampton Corporation ask for authority to relax the present building by-laws in respect of iron, steel, or reinforced concrete structures, and to make rules governing such erections.

By permission of the architects, Messrs. Lanchester and Rickards, about fifty students attending the building construction classes at the Croydon Polytechnic made, on a recent Saturday afternoon, a tour of inspection over the New Wesleyan Hall at Westminster. The party was accompanied by Mr. J. Crewdson, the teacher of building construction at the Polytechnic. The build- is on the site of the old Westminster Aquarium. The party were shown over by Messrs. Howell and Elliott.

* * *

At a representative meeting of engineers held at the Midland Hotel, Manchester, on January 12th, it was resolved that a general engineering and allied trades exhibition shall be held in the spring of 1911, under the management of a committee of exhibitors, and to be organised by the International Trade Exhibitions, Ltd., London. The building is now in course of erection in Old Hall Lane, Rusholme, and will have a ground floor area of 100,000 sq. ft. This is two and a half times the ground floor area of any exhibition hall out of London. Particulars can be obtained of at the London address, Broad Street House, E.C., or at 20, Mount Street, Manchester.

STONE HOUSE, HAWES, YORKS: INGLE IN DRAWING ROOM. P. MORLEY HORDER, F.R.I.B.A., ARCHITECTS.

The drawing-room is panelled in oak, and has a large ingle. The windows look out over the tennis lawn and rose garden, and there is a door opening on to the veranda.

THE WARMING AND VENTILATION OF PUBLIC BUILDINGS AND FACTORIES.*

By T. W. Aldwinckle, F.R.I.B.A.

Climatic Consideration.

At the outset we approach a matter of difficulty which must be adjusted before due consideration can be given to the subject, and that is the matter of climate. We must think of the subject from *our* point of view, of ventilating and warming buildings in this country. The principal text-books on the subject are either American or German, and we are apt to be guided by those textbooks, without remembering that the climate in those countries is very different from our own. In the first place, the climate in those countries is dry, whilst ours is humid. One result of this is that the internal temperature of the rooms is with them about 70 degs. F., while with us it is about 60 degs. F. With a humid climate such as ours, an internal temperature of 70 degs. F. is distinctly uncomfortable. Then again, the winter temperatures are different. It is usual in America, in calculating heating surface for warming apparatus, to assume the winter external temperature at the zero of Fahrenheit, or 32 degs. of frost, and in Germany at 4 degs. below zero. Now the English winter is not a pleasant one; it is long and disagreeable in a variety of ways; but we are not subject to very low temperatures, and in designing heating apparatus it is certainly not necessary to allow for an extreme external temperature of lower than 20 degs. F., if indeed so low. Thus we see that we must adjust the American and German systems to the conditions of our own climate before they can be serviceable to us.

The Primary Object.

As the primary object of ventilation is to provide pure air in rooms and halls, it is necessary to find some standard or standards of purity. The usual standard is a certain proportion of carbon dioxide (CO_2). Normal air contains three parts in 10,000 of CO_2 in the country, and about four parts in large towns. As human beings give off a certain quantity of CO_2 per hour, it is obvious that the number of parts in 10,000 will be increased in an inhabited room, and the object of ventilation is to prevent such an increase as shall be unhealthy or uncomfortable. There are other impurities produced in an inhabited room, such as watery vapour ejected from the lungs, dust particles, and exhalations from the skin and alimentary canal. There are also the products of gas combustion when the same is used as an illuminant.

It is generally accepted that to ensure a perfectly healthy room the added impurity of CO_2 should not exceed two parts in 10,000, making a total of 6 parts per 10,000. There are, however, many conditions in connection with inhabited rooms or halls, which render it well-nigh impossible to attain such a result, and we have then to be content with a standard which is not so good. This is generally the case with theatres and similar buildings, school classrooms, and crowded factories.

The amount of CO_2 given off by persons is shown in cubic feet per hour in the following table:—

	In repose.	In gentle exercise.	In hard work.
Adult Male ...	0.6	0.9	1.8
Adult Female ...	0.4	0.6	1.2
Children ...	0.3	0.45	0.9

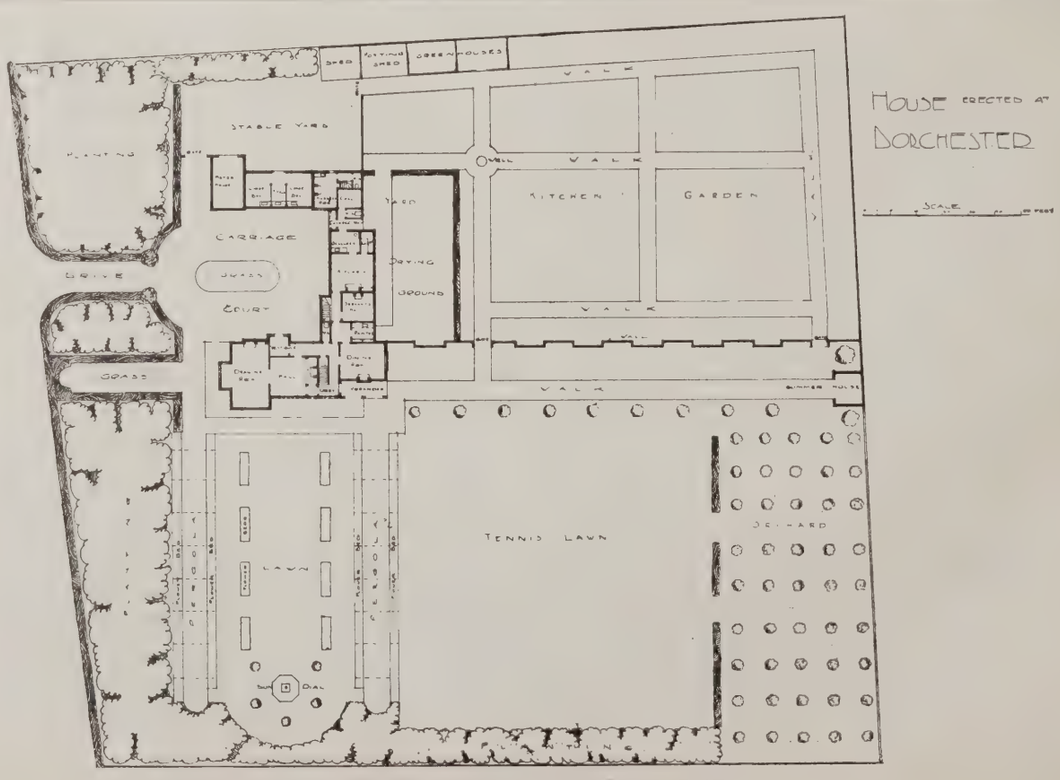
Gas as an illuminant produces in combustion a little more than ½ cubic foot of CO_2 for each cubic foot of gas burnt, and about double this quantity of aqueous vapour. Gas combustion also produces other impurities, such as carbon disulphide, etc. The introduction of the incandescent gas mantle, however, by reducing the amount of gas burnt per candle-power, has considerably reduced the impurity from this source, while there are no impurities resulting from the electric light.

Human beings produce a certain quantity of heat, which is expressed in units of heat per hour, and this is, according to Pettenkofer, about 400 units for adults, and 200 for children in an atmosphere of 70 degs.

From these tables it will be apparent that the occupants of a room exercise a very considerable influence upon the purity of the air, and upon its temperature.

As to the amount of fresh air per head which should be supplied, authorities differ somewhat, some of the suggested quantities being quite impracticable; but the following may be taken as reasonable, and capable of being put into execution under normal conditions:—

Class of Building.	Cub. ft. of air per person per hour.
Hospitals (ordinary)	3,000 to 5,000
Hospitals (fever)	6,000
Theatres	500 to 1,000
Workshops	1,000
Halls of assembly	1,000
Classrooms (elementary schools)	1,000 to 1,500



Amount of Air per Head.

In deciding the amount of air to be provided per head, regard should be had to the period during which the room or hall will be occupied. Thus, hospital patients occupy the ward by day and by night, and therefore require a higher standard of purity in the air than the audience at a theatre or concert-hall, who are only in the building about three hours.

The cubic space per head is not so important as might be imagined, so long as the requisite amount of fresh air is supplied without draughts and at a suitable temperature. A room may have a large cubic space per head, and yet, from imperfect ventilation, the amount of CO_2 may be found to be unusually high. An interesting illustration of this is to be found in Haldane's Departmental Report on the Ventilation of Factories and Workshops (CD 1302) (1902). The instance quoted was a cotton spinning mill, having a cubic space of over 10,000ft. per worker, where, owing to the absence of suitable ventilation, the CO_2 rose to 16.5 parts per 10,000, and this with a high internal temperature, viz., 92 degs. F., and without gas lighting.

It must be borne in mind that no rigid system can be successfully applied to all buildings alike, but that the nature of the building, and the purposes for which it is

*Abstract of a paper read before the Association of Engineers-in-Charge.

P. MORLEY HORDER, F.R.I.B.A., ARCHITECT.

HOUSE AT DORCHESTER: THE ENTRANCE FORECOURT. P. MORLEY HORDER, F.R.I.B.A., ARCHITECT.

Local stone was not available for the whole building, but some has been introduced into the porch and as a base to the house, used in large unsquared pieces, irregularly mixed with the rough-cast and red brick in the old local manner.

intended, must be separately considered in each case; and as there are numerous methods of ventilation, both natural and mechanical, we have several good systems from which to make a wise selection.

Natural and Mechanical Ventilation.

Our climate lends itself to natural ventilation because it is a temperate one, admitting of open windows, and this system of ventilation, which is the cheapest of all systems, is suitable for most domestic purposes—for offices, committee rooms, entrance halls, corridors, staircases, and factories and workshops having a large cubic space per worker. For rooms and offices open fireplaces are much preferable to radiators as a means of warming, as they are exhaust ventilators, and induce a current of air to flow in through the open windows. Nothing is more oppressive than to have to sit for some hours in a room where there is a radiator and no open fireplace. As regards staircases and corridors, it is not necessary to put them under a plenum or exhaust system. Radiators with open windows will be quite sufficient for all purposes. Generally speaking, with a climate favourable to natural ventilation, I think that every effort should be made to use this system wherever practicable.

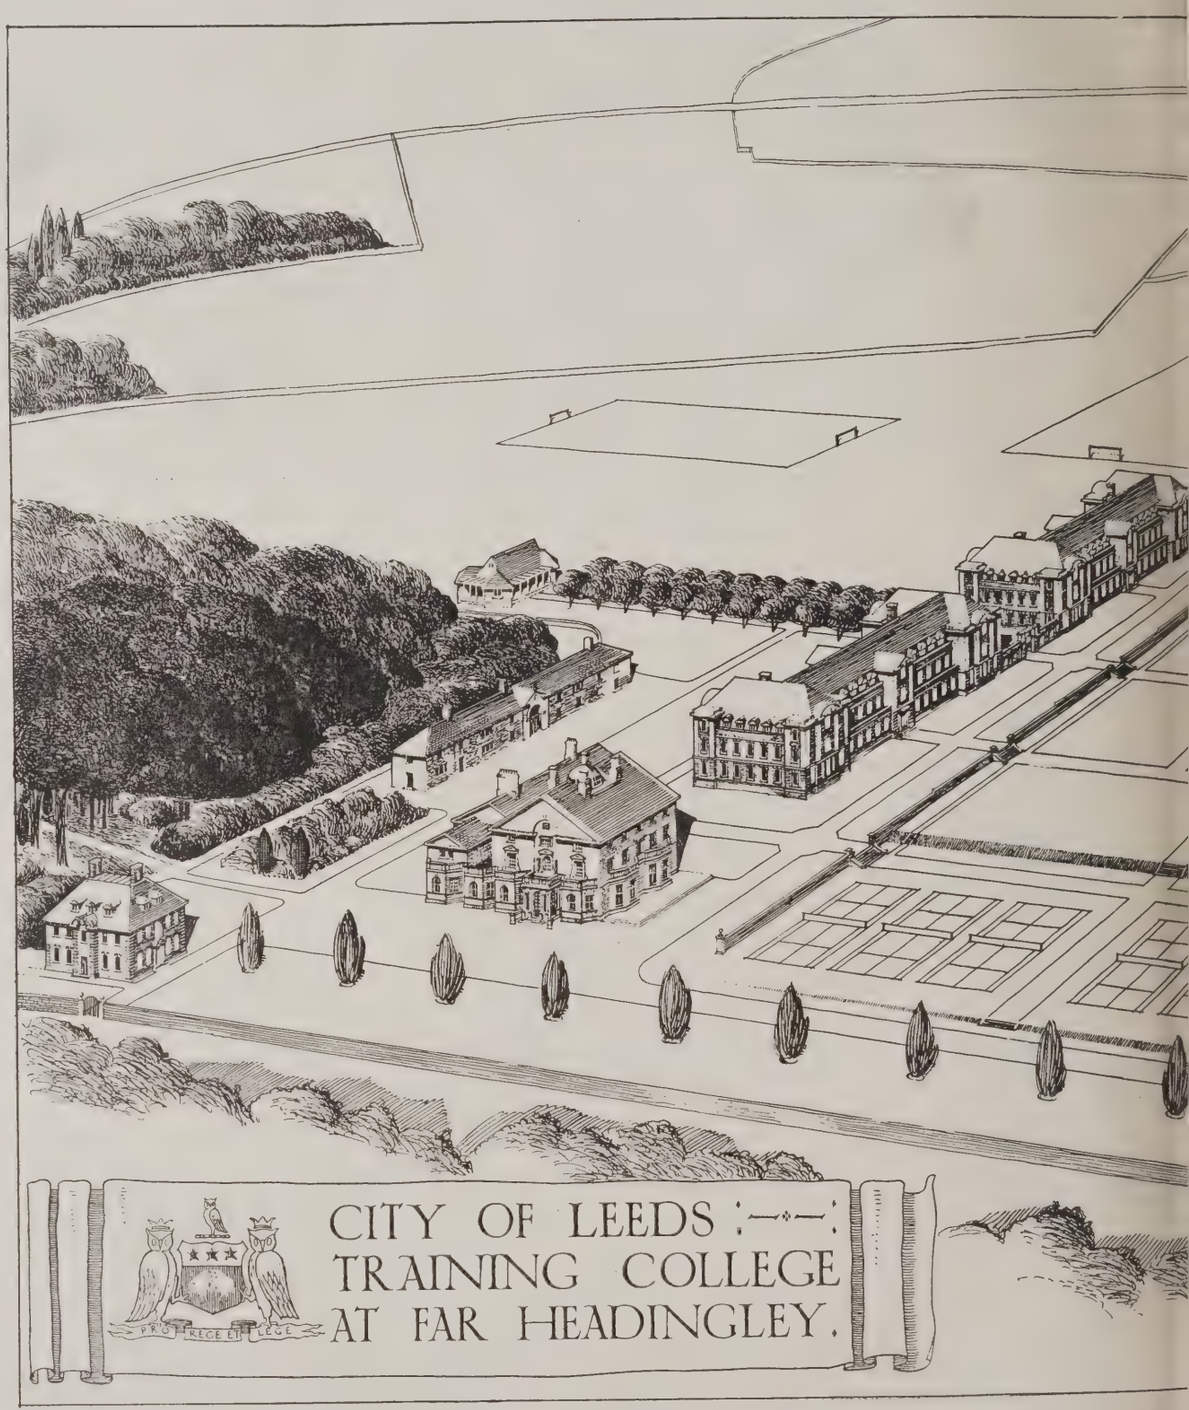
In the so-called natural ventilation with vertical pipes and cowls, or other terminals, these are all dependent upon the action of the wind to produce an upward current and are therefore useless when the external air is still and close.

Ventilation of Hospitals.

A hospital ward is also an instance where our climate lends itself to natural ventilation. I believe that the great majority of medical superintendents of hospitals will tell us that there are from 300 to 330 days in the year when the windows of a ward can be opened without injury to the patients. This at once obviates the necessity for close mechanical ventilation. I will just describe to you the ideal ventilation of such a ward. In the first place, you have good cross ventilation. The windows will be on both sides, and will extend from 2ft. 6ins. above the floor to close up to the ceiling. There will be double-hung sashes, finishing at the top with a transom and a hopper ash, to open in glazed cheeks. Thus the rate and position of the admission of the fresh air can easily be regulated. There will also be cold, fresh air inlets in the external walls at the floor line to prevent the accumulation of vitiated air at that level. There may be also supplementary inlets in the side walls admitting air, to be passed through low-temperature, hot-water radiators, for use in very cold weather. Lastly, you have the large open fireplaces in the centre of the ward radiating heat, a bright and cheerful view for all the patients, and withal powerful exhaust ventilators, removing the vitiated air at a velocity of about 6ft. per second, close to the floor level. Some may say that this is not scientific ventilation and warming. It may not be, but its results cannot be challenged.

In this connection it may not be out of place, although anticipating a little, to consider the alternative of mechanical ventilation in relation to a hospital ward. I regard the plenum system as entirely unsuitable, for the following reasons: As the air will have to travel a considerable distance from the fan to the several inlets to the ward, it has to be warmed to a high temperature to start with, in order that it may enter the ward sufficiently warm. Then it has to pass along a series of ducts difficult of access for cleaning purposes. Anyone conversant with the plan and section of a ward pavilion will understand this. Exhaust ventilation is more suitable for a ward than the plenum, but it is not equal to natural ventilation, on account of the absence of open fireplaces and the necessity for closed windows. This system was adopted at the South-Eastern Hospital carried out by me in 1905, in deference to the wishes of the committee, who desired to dispense with open fireplaces, so as to avoid the expense of labour in attending to them, and the dust arising therefrom. The extraction is by means of propeller fans in vertical shafts removing 6,000 cub. ft. of used air per bed per hour. The inlets for fresh air are in the side walls under the windows, and the air is warmed in winter by impinging upon low-pressure, hot-water radiators enclosed in removable cases, the inlets being capable of regulation. The heating surface of the radiators on the east, or colder, side of the ward is 10 per cent. in excess of that on the west side. One important matter must be borne in mind in relation to an exhaust system of ventilation in a ward, and it is that the extracting power of the fans may draw in the air from undesirable inlets, such, for instance, as from the sanitary turret. To obviate this at the South Eastern Hospital I provided a separate fan to extract the air independently from the sanitary turret, of sufficient power to resist any pull in the direction of the ward.

Churches and Chapels.



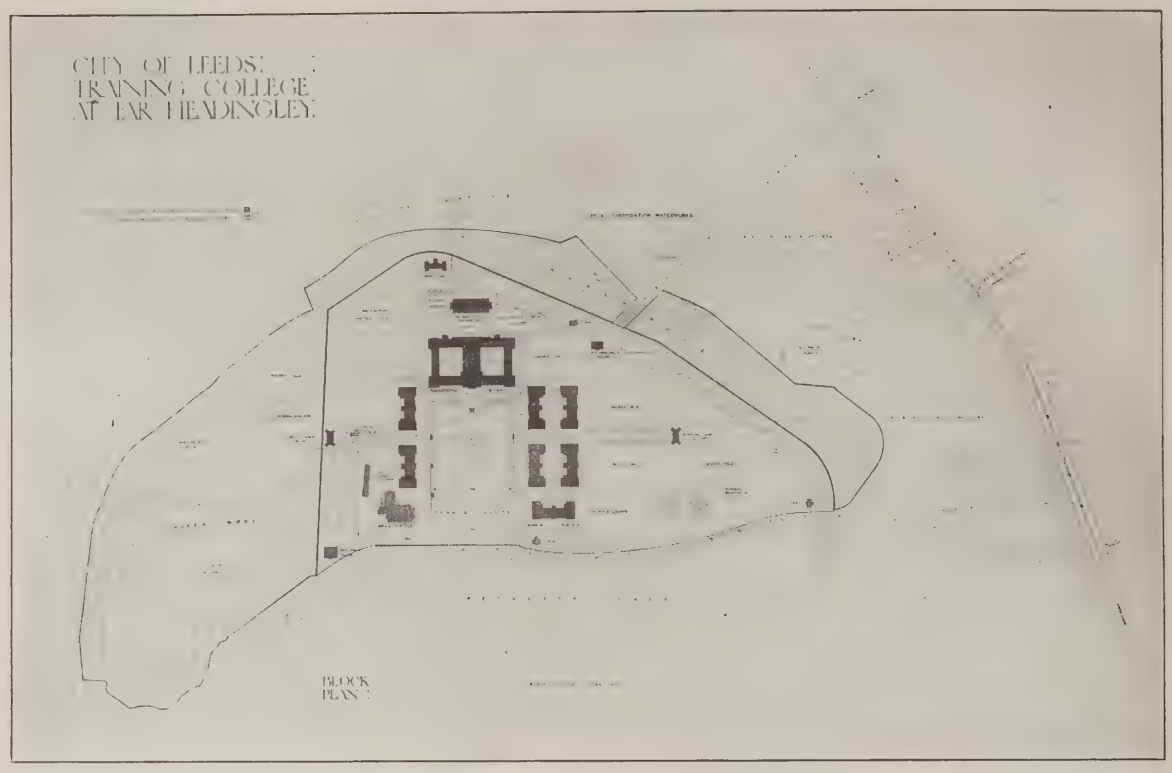
The warming and ventilating of churches and chapels are seldom satisfactory, particularly churches with a lofty nave and clerestory windows. Cold draughts are usually much complained of. This is caused by the very large cooling surface of the walls and windows as well as the open roof. It is a good plan, whatever the warming apparatus may be, to keep it going constantly throughout the winter. If allowed to go down when the building is not in use, the walls soon become cold, and the warming process has to be gone over again. Means should be provided for warming the air at the upper part of the building.

We may safely assume that natural ventilation is unsuitable and non-effective in most cases where a considerable number of persons are congregated together in a hall, room, or factory, with a less cubic space per head than 300ft. This is because it is impossible to put into the room the requisite amount of fresh air, without creating unpleasant draughts, and without lowering the temperature of the room during the winter to a point below that which is requisite for health and comfort.

Tests of Ventilation.

In dealing with the records of any tests of natural ventilation taken during the winter months, it is advisable to take careful note of the internal temperature of the room. It is a very easy matter to throw open the windows and flood the room with cold air, and thus produce a low proportion of CO_2, but the problem of ventilation is not thereby satisfied. A suitable temperature must also be provided, and this is often a matter of considerable difficulty, and one which is sometimes wholly ignored.

Mechanical ventilation can be conveniently divided into three classes, viz.:—Exhaust ventilation, plenum ventilation, and plenum and exhaust ventilation, and with a variant upon all three as "upward" or "downward."



CITY OF LEEDS TRAINING COLLEGE AT FAR HEADINGLEY.

ACCEPTED DESIGN.

ATKINSON, ARCHITECT.

ACCEPTED DESIGN. G. W. ATKINSON, ARCHITECT.

Mechanical ventilation is suitable for, and in some cases only adaptable, for the following buildings:—Theatres and concert halls, courts of justice, town halls, council rooms, waiting halls for outdoor patients, crowded factories and workshops, operating theatres, laboratories.

Economy, Effectiveness, Comfort.

To render any system of mechanical ventilation economical, effective, and also comfortable to those who must pass a good deal of their time in it, we should provide large duct areas and low velocities in delivering or exhausting the air, and large heating surfaces and low temperatures in the warming parts of the system. I do not myself consider that air for warming purposes should ever be passed over or through heating surfaces having a higher temperature than 150 degs. F., for the reasons which will be hereafter given.

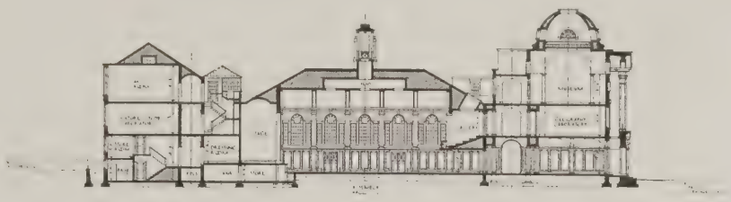
Exhaust ventilation has usually the advantage of being simpler and more economical in construction than the plenum system, and more easy of adaptation to existing buildings, and it is free mostly from the necessity of long air inlet ducts. With suitable and efficient means of extraction provided, a definite quantity of the vitiated or used air is removed per hour, this operation drawing in a corresponding quantity of external air to take the place of that which is removed. In the old days, and indeed until about twenty-five years ago, the air was extracted by means of vertical shafts, in which an upward current was induced by heating the air to a temperature considerably higher than the external air.

This system of producing an upward current was very costly, and has been entirely superseded by the use of fans, which, if driven at a moderate speed, are very economical to run. The current of air induced by a heated shaft is at best rather a feeble one, and varies with the temperature of the external air, being the least effective when it is most required, viz., when the external air is warm and close.

Exhaust Ventilation.

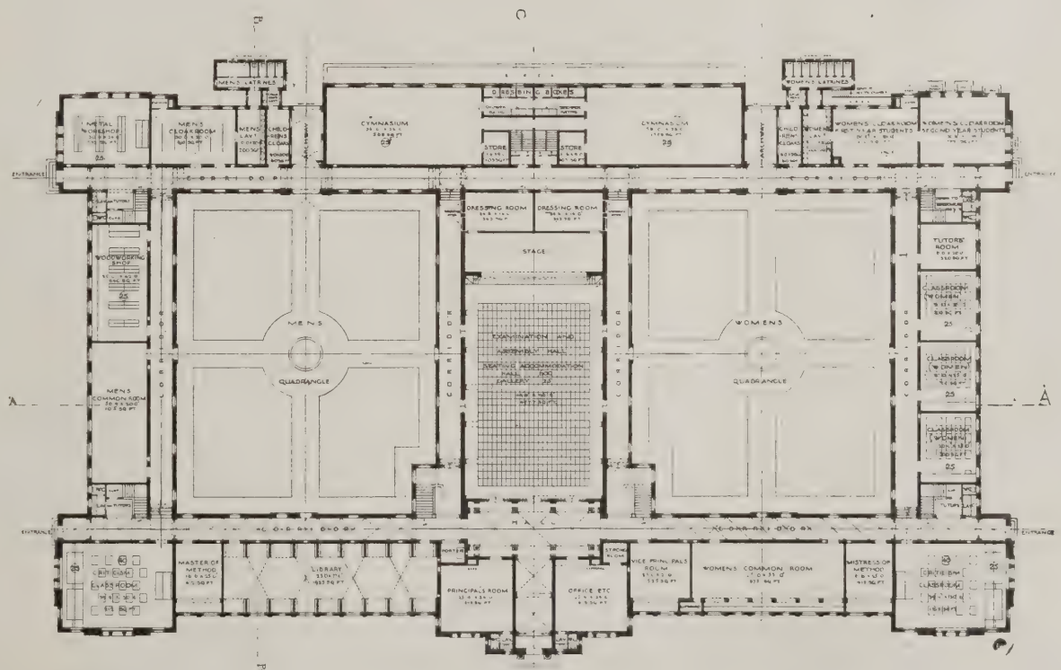
Exhaust ventilation is generally of an upward character, the extraction being in the ceiling or roof, and the inlets near the floor or near the breathing line. The arrangement of the extraction is generally a simple matter, if care is taken to provide fans of suitable capacity. Where the resistances are small and the extraction ducts (if any) are short, propeller fans can be used, but where the resistances are high, the ducts long and numerous, and the quantity of air to be removed is large, centrifugal fans are necessary. Generally speaking, it may be stated that propeller fans should not be used for a resistance of over ¼in. of water, as the quantity of air passed will be small against a high resistance. In this connection it should be borne in mind that the work done by an extracting fan consists not only in removing the vitiated air, but also in bringing in the fresh air through the authorised inlets, and that these inlets offer, in many cases, considerable resistance.

When the quantity of air to be removed is large, and coming possibly from several rooms into one extraction shaft, the direction, shape, and size of the extraction ducts require great care and consideration, with a view to reducing the resistance, and to secure that each inlet into the duct shall carry its due proportion of air. It is very important that all inlets into the main trunk should be well curved in the direction of the air current in the duct, and that the duct should be tapered or otherwise enlarged so as to be able to carry the increased volume of air brought in by successive inlets without altering the general velocity. It should also be borne in mind that very high velocities should be avoided, as not only does this increase the resistance due to friction in the ducts, but the horse-power necessary to drive the fan increases as the cube of its speed. Thus, if a fan is running at 400 r.p.m., and drawing 4,000 cubic ft. per minute through the duct, and taking 2 h.p., doubling the speed of the fan in order to draw double the quantity of air through the same duct, will require 16 h.p., to say nothing of the increased friction in the duct. This means that it is more economical in horse-power, and consequent annual cost, to arrange good-sized ducts, with the air travelling at a moderate velocity. It is also important to have plenty of access doors to the ducts for cleaning purposes.



The extracting arrangements being complete, let us now consider the inlets. The position of these will vary according to the requirements of the hall or room, but it is essential that the external air shall enter as direct as possible from the outside, not near the ground level, and far from any source of air pollution. In a simple system of extraction ventilation there will generally be openings in the external walls, with gratings and channels through the walls, close, if possible, to the floor level. All these inlets should be regulated by dampers, as with a strong wind blowing upon the inlets a large influx of air would be uncomfortable. The net area of the inlets should be such as will admit the necessary quantity of air at a velocity of not more than 3ft. per second. The channels through the walls should be lined with glazed bricks, and means of access should be provided for cleaning purposes. Then the incoming air has to be warmed during the winter. This requires that a radiator should be placed in front of the inlet, with baffles so arranged that the incoming air impinges well upon the surface of the radiator before entering the room. This is preferable to enclosing the radiators in cast-iron cases, as these harbour dirt inside.

"Authorised" Inlets.



The inlets just described we term "authorised" inlets. The suction power of the fan will, however, to some extent be felt all over the hall or room, and a certain amount of external air, not by any means a small quantity, will be drawn in from any point through which the air can enter, such as through external walls, chinks in windows, and the like. These are called "unauthorised" inlets, and must be reckoned with. Care must in the first place be taken that air is not drawn in from any polluted sources. The risk of this is one of the disadvantages of the "exhaust" system. Also in calculating the heating surface for the general warming of the rooms, allowance must be made for the air which will come in through these "unauthorised" inlets. This air will be cold, and will require warming, and this is another drawback to the exhaust system from which the plenum system is free. This in-leakage or air through walls, especially in cold weather, is considerable even with natural ventilation, but it is much greater when there is a partial vacuum in the room caused by the exhaust fan.

FRONT ELEVATION

SECTION C—C

GROUND FLOOR PLAN.

CITY OF LEEDS TRAINING COLLEGE, FAR HEADINGLEY. ACCEPTED DESIGN. G. W. ATKINSON, ARCHITECT.

We must always bear in mind that to render a system of exhaust ventilation complete and efficient, at all events in the winter, the windows must be kept closed, and the air supply obtained from the authorised inlets. It will be obvious that if the extracting fan is efficient the external air will be sucked in at the point of least resistance. If a window 3ft. wide is open, say, to a height of 3ft, that would be an inlet area of 9ft., which would be, at least, three times larger than the net area of any authorised inlet, and that the external air will consequently enter through the window and not through the inlet. This can be verified by any one who wisely possesses a Tobin tube in his own dining-room. In the winter, with a fire going, the air will enter through this tube at a velocity of about 2 or 3ft. per second, but if a window is opened the inlet entirely ceases to act.

The exhaust system is suitable for town halls, council rooms, large city offices, and banks, schoolrooms, and under some conditions for factories and workshops.

Plenum Ventilation.

The primary advantage of plenum ventilation is that it puts into the hall or room a specific and measurable quantity of fresh air, in specific positions, at definite and ascertained velocities, and at definite temperatures, and that this air can be filtered, moistened, and warmed at the main air inlet. No other system admits of these advantages. The exits of air can be arranged at "authorised" outlets, which should be carefully protected against wind influence, but a portion of the air can also escape, and is always pretty cure to do so, through some "unauthorised" outlets. In this case, however, no harm can accrue from any pollution or from any lowering of the temperature of the room.

The main drawbacks to the plenum system are (*a*) that as a rule, long ducts are necessary for the distribution of the air, and (*b*) that as the air has to travel a considerable distance along these ducts, the initial temperature as it leaves the heating battery is generally arranged somewhat high, in order to compensate for the cooling in the ducts. These heating batteries are generally heated with steam from 10lbs. to 40lbs. pressure, or at temperatures from 240 degs. F. to 285 degs. F. This causes a baking or drying of the air, and as in our climate we are accustomed to air with a fairly high degree of humidity, the artificial drying of the air causes unpleasant sensations. We constantly hear complaints on this score from those in this country who pass a considerable portion of their time in halls or rooms under plenum systems. One hears of no such complaints in America or Germany, because they are accustomed to a drier atmosphere. I am strongly of opinion that we can remedy these defects and render plenum ventilation more acceptable, become more comfortable to us, by working upon somewhat different lines in the manner I shall hereafter describe, in connection with a building which I have recently warmed and ventilated upon the plenum system for the Metropolitan Asylums Board.

The Most Effective Form of the Plenum.

It is when plenum is coupled with auxiliary exhaust that I consider it most effective. The outlets can be better regulated, and the intended direction of the air currents better ensured. The word "plenum" suggests that the air of the rooms is under a mild kind of pressure, ensuring its equal distribution (assisted by the law of the diffusion of gases) throughout the room, and this is the primary object of all effective ventilation. Care must be taken to avoid short circuiting of the air, either by having the exhaust too powerful, or by having the outlets placed too near to the inlets. It is desirable for this reason that the power of the plenum fan shall always be in excess of the exhaust. There is no fear of the air not getting out, it will always find a way when necessary.

It is essential that the fresh air should be brought in from a pure and uncontaminated source, and at some height above the ground level, particularly in large towns, and the inlet should be well protected against wind and rain. It is preferable, if possible, to have the air intake on the southern or warmer side of the building. The incoming air generally requires some kind of filtration, if only to remove the particles of dust. It is very important that this filter should be either self-cleansing or easily cleansed. There should also be a good water spray to prevent drying of air. I have used a filtering screen consisting of a large number of galvanised steel rods placed to break joint about ¼in. apart, all being removable. A water trough is placed above these, from which water trickles down the rods.

For the purpose of driving the air through the duct a centrifugal fan is almost necessary, a propeller fan being not equal to overcome the resistance. The fan should, for the reasons already given, be driven at only a moderate speed, and should have a fair reserve of power, so that there may be no question as to the amount of air supplied. An electric motor is the best kind of power to drive the fan, and there should be means of speed regulation.

The heating battery through which the air is driven for warming purposes should not, in my opinion, have a higher temperature than 150 degs. F. In order to prevent undue loss of temperature in the main ducts, these latter should have hot-water pipes placed in them.

In theory the effectiveness of heating surfaces in thermal units increases with the velocity of the air passing over such surfaces, but there is a limit to this, and it is found in practice that air moving at a very high velocity does not give proportionally high temperatures, as a larger volume of air is passed, and the time of contact is decreased. It was found by experiment that air passed through a battery of 75lbs. steam at a velocity of 27ft. per second gave a much lower temperature than at a velocity of 15ft. per second.

Control of Temperature.

In order to secure adequate control over the resulting temperature in the rooms, the battery should be so constructed that parts of the heating surface can be shut off by valves. This will enable the room temperature to be regulated to meet the varying temperatures of the external air.

As the plenum will be required without warming during the summer, a by-pass duct should be provided by which the air driven by the fan can enter the main duct without passing through the heating battery. One reason for this is that these batteries offer considerable resistance to the air, and thereby increase the work of the fan. In America the main ducts are frequently in duplicate, one for warm air and one for cold air, with mixing chambers and regulating dampers at the base of each vertical air-shaft. This admits of the temperatures of the air entering the room being well regulated. In that country they use, however, as a rule, small ducts with high velocities of air. There is no room for this duplication of ducts upon the principles proposed in this paper.

The general arrangements of the main and branch ducts will depend upon the nature of the building, the number of floors, and the purpose for which the rooms or halls are used. But one general principle should be followed, viz., that of large sectional areas and low velocities as already explained. Another good reason is that the ducts should, as far as possible, be large enough for access for cleaning purposes. This is of the highest importance, as, without the means for frequent and thorough cleaning these ducts can, and indeed frequently do, become very dirty and foul, and as such are a source of danger to health. As a matter of sound principle there should be no portion of any ducts, or any inlet, which cannot be easily cleansed out. This may appear a large order, but it is perfectly feasible and is absolutely essential. This matter of foul and unclean ducts is a strong argument frequently used against the plenum system, and it is one to which the most careful attention should be given.

The velocity at which the air enters the room or hall will vary with the conditions—with downward ventilation, say, in a theatre, with the air entering at or near the ceiling, and consequently well above persons' heads, a fairly high velocity in allowable, especially if the air current will have to travel some distance; but where the inlets are near the occupants of the room a velocity of 3 to 4 ft. per second will be sufficient, provided that the collective area of the inlets is sufficient to provide the requisite amount of air at such a velocity. The angle at which the air jet will enter has to be carefully considered, according to the circumstances of the case. Each inlet should also have a regulatory valve, as simple and ready control is the essence of all good ventilation. The temperature at which the air will enter the room must be definitely arranged, and must be capable of ready adjustment at the heating battery as already described. This comes to be a matter of much importance in places where large numbers of persons assemble, such as theatres and the like. Each adult person gives off about 400 thermal units of heat per hour, so that an audience in a theatre numbering, say, 1,500 persons, with an air allowance of 1,000 cub. ft. per head per hour, will, in one hour, have given off sufficient heat to raise the temperature of the air 22 degrees F. Such being the case, it is obvious that the incoming air would usually have to enter at a temperature lower than that of the auditorium.

(To be concluded.)

Proposed New Works.

ABERAVON.—The L.G. Board has held an enquiry into the application of the Town Council for a loan of £10,000 to build a new market.

ABERDEEN.—The Town Council has approved the following plans:—Alterations in connection with business premises on the east side of Loch Street, for the Northern Co-operative Company, Ltd., per Messrs. Brown and Watt, architects; addition at the rear of premises No. 415, Union Street, for Messrs. Wm. Cay and Sons, per Messrs. Brown and Watt, architects; four dwelling houses on the south side of Westburn Road, for Mr. James King, builder, per Messrs. W. Henderson and Son, architects; alterations in connection with the Palace Theatre, Bridge Place, for the United Counties Theatres, Ltd., per Mr. W. E. Bickers, architect, Bradford, and Mr. John Rust, architect; dwelling-house on the north side of an un-named street running westwards from Clifton Road to the south of the entrance to Hilton House, for Mr. Joseph Shirras, jun., builder. The committee also approved plan of proposed alterations on the building in Guild Street, formerly known as Her Majesty's Theatre, for the Tivoli (Aberdeen), Ltd., per Messrs. Frank Matcham and Co., architects, London. From the burgh surveyor's report it appeared that it was intended to make extensive internal alterations on the building, for the purpose of converting it into a music hall; that when the alterations were carried out the building would be greatly improved, and would provide accommodation for 1,148 persons.

AMERSHAM.—The R.D. Council has passed plans for the following:—Three cottages, Hyde Heath, H. Kennard; gymnasium, Milton Avenue, A. M. Taylor; 22 cottages, Church Lane, Great Missenden, L. L. Greaves; dwelling-house, Packhorse Road, Chalfont St. Peter; cottage, Chalfont Common, F. Mead; house, Ridgway, Chalfont St. Peter, W. T. Walker; house and shop, Gold Hill, Chalfont St. Peter, D. Ryder; house, Shardeloes Estate, Amersham, H. Kennard; new stables, Ashley Green, G. Darvell; cottages, Chalfont

St. Peter, Francis and Jones; six cottages, Chalfont St. Peter, Y. J. Lovell.

BLACKBURN.—A scheme is on foot for the erection of new assembly halls, sessions house, and police headquarters, to be erected on Blakey Moor. The buildings are in two blocks, being separated by a gateway and courtyard. The main assembly is designed to give accommodation for 3,500 persons. Two smaller halls will accommodate 1,271 and 524 persons respectively. The whole of the buildings are to be constructed of stone obtained from local quarries, and the cost is estimated at £113,000. The joint architects are Messrs. Briggs, Wolstenholme, and Thornley, and Messrs. Stones and Stones.

BOURNEMOUTH.—The Guardians have decided to erect a new infirmary at the Christchurch Workhouse, which will involve an expenditure of about £11,000.

BOURNEMOUTH.—The Local Government Board inquiry into the application of the Bournemouth Corporation to borrow £77,000 for the purposes of erecting a pavilion or kursaal upon the Belle Vue site, near the pier, has been concluded.

BRADFORD.—The Site Selection Committee for the New Bradford Infirmary have arranged to purchase the Field House Estate of 23 acres at Daisy Hill, as a site for the new building.

CARDIFF.—The question of the site for the proposed new fire station has been discussed at some length by the Town Council, and on the proposition of Alderman F. J. Beavan it was decided, by 19 votes to 8, to erect a station on Cathays Park at a cost not exceeding £15,000. The city engineer (Mr. Harpur) submitted three alternative plans and estimates, as follow:—Westgate Street, £17,323; Womanby Street, £13,078; Cathays Park Site, £23,829.

DUNFERMLINE.—Permits have been granted Peter Macdonald, brick builder. Thistle Street. to erect a block of three dwelling-houses in the new street running from Victoria Terrace to Thistle Street. James Beveridge, manufacturer, Park Avenue, to erect three double cottages of four houses each in Elliot Crescent.

FAREHAM.—The L.G. Board has held an enquiry into the application of U.D. Council to borrow £2,000 for the erection of a fire brigade station.

HASTINGS.—The Town Council has passed plans for the following:—Conversion of No. 111, Priory Road, into two tenements; Mr. E. G. Hutchinson, owner; Mr. A. Dray, architect. Store at Branksome Road. Filsham Park Estate; Mr. E. P. Haviland, owner; Mr. Thos. Elworthy, architect. Glass covering at the rear of No. 130c, Queen's Road; Mr. H. Blackman, owner; Mr. E. Pollington, architect. Double cottage, road leading from Elphinstone Road to Dover Terrace; the Misses Oakley, owners; Mr. A. R. Jemmett, architect. Alterations to No. 8, West Hill, St. Leonards; Miss Norah Harris, owner; Messrs. Wm. Gibbins and Son, builders.

LONDON, E.C.—It is proposed to demolish the Great St. Helen's Synagogue, sell the site and build a fresh edifice in the Commercial Road, E.

LONDON, S.W.—A faculty has been granted by Dr. Tristram, presiding over a Consistory Court in St. Paul's Cathedral, for the erection of a marble reredos in Holy Trinity Court, Sloane Street, S.W., at a cost of about £2,000. Mr. Gregory, solicitor, in making the application, said the reredas was the gift of an anonymous donor. The design is by Mr. John Tweed.

NELSON.—The following plans have been approved by the Town Council:—Plan for Messrs. Fewster and Wilcock, two houses, Barkerhouse Road; Mr. A. Edmondson, eight houses, Pont Street; Netherfield Men's Institute, conversion of two houses into club premises, Crowther Street.

ROCHDALE.—The Town Council have appointed Mr. P. W. Hathaway, architectural assistant in the Borough Surveyor's Department, as architect to advise the General Purposes Committee on the question of alterations and additions required at the Town Hall.

ROWLEY REGIS. — The vicar and churchwardens of the Parish Church are again experiencing great difficulties with respect to the church fabric owing to mining operations. Some years ago it was necessary for the safety of the congregation to take down the tower, and it has been re-erected in sections at a great cost. At the present time the work of restoration is not complete, and a very considerable debt has yet to be liquidated. Recently it has been ascertained that the foundations of the new sections of the church are giving way. Streams of water percolate through the roofs after snowstorms. It will be necessary for the new sections of the church to be repaired and the parishioners are hopeful that the churchmen in other parishes will come to their aid.

SCARBOROUGH.—The L.G. Board has held an enquiry into the application of the Town Council to borrow £3,000 for the erection of a pavilion in the Alexandra Gardens, North Cliff.

WESTMINSTER.—The City Council are seeking Parliamentary sanction to acquire, for the sum of £2,000, the right of user of St. James's Vestry Hall, Piccadilly, now possessed by the vicar and churchwardens. By the bill the vicar and churchwardens are empowered to expend £2,000 in the erection of a Mission Hall or Clergy House.

WOOLWICH.—It is proposed to erect a permanent church, to supersede the small iron building dedicated in 1884, in the mission district of St. Augustine's, Belvedere. When the permanent church has been provided the mission district will be formed into an ecclesiastical parish. The estimated cost of the proposed structure, plans for which have been prepared, is £7,000, but the Building Committee are anxious to start at once with the first portion only, which will cost £4,050. This will include the chancel, nave, choir, clergy vestries, and four bays of the nave and aisles, accommodating 500 worshippers.

WORTHING.—The L.G. Board has held an enquiry into the application of the Town Council to borrow £3,000 for the purchase of Gloster Lodge, Chapel Road, as a site for municipal offices.

LONDON MASTER BUILDERS' ASSOCIATION.

The meeting of the Council which took place on Thursday January 20th, was largely attended, and the items comprising the agenda were unusually interesting to the trade. The president (Mr. F. G. Rice) presided.

The report of the Organisation Committee was read by the deputy chairman, Mr. G. Bird Godson, and approved by the Council.

The telephone card giving list of associate members was submitted and approved, and it was ordered that it be distributed.

It was also decided to distribute to the London members of the Royal Institute of British Architects, the Surveyors' Institution, and the Quantity Surveyors' Association, the handbook published by the London Master Builders' Association, and it is hoped that it will prove useful and interesting to them.

One ordinary member and eleven associate members were proposed and duly elected.

The report of the Finance Committee was received, and the items of the income and expenditure account, and those of the balance-sheet of the year ending on December 31st, 1909, were submitted by the treasurer (Mr. James S. Holliday), and the professional auditor (Mr. G. A. G. Robertson) made his report, and stated that he had carefully audited the books, vouchers, and investments of the association and found them correct. They were approved and recommended to the annual general meeting for adoption.

The President (Mr. F. G. Rice) reported to the Council that he, together with Mr. Leonard Horner, Mr. G. Bird Godson, Mr. Frank May, Mr. J. Carmichael, Mr. F. Higgs and the secretary, met in conference representatives of the London Association of Master Masons (Mr. F. Corben, Mr. Walter Tomes, Mr. L. F. Chislett, and Mr. Walpole Collins), on January 18th.

The possibility of affiliating the two associations was discussed very fully at this conference. The conditions to be observed were carefully considered, and the president laid it down very distinctly that the agreements made by the London Master Builders' Association with the Workmen's Societies must be strictly and honourably observed.

Another conference was held on the same day, but separately, with the London Association of Master Decorators, when the London Master Builders' Association was represented by the president (Mr. F. G. Rice), Mr. Leonard Horner, Mr. G. Bird Godson, and Mr. James S. Holliday, with the secretary in attendance; and the London Association of Master Decorators was represented by the president (Mr. H. A. Campbell), Mr. J. Anderson, Mr. F. Dakin, and the secretary (Mr. A. Davidson). The affiliation of the two bodies was carefully considered, and the president of the London Master Builders' Association (Mr. F. G. Rice) drew attention to the importance of strict observance of rules made by the L.M.B.A. with the trade unions.

At both the above-mentioned conferences, many expressions of sympathy and desire for affiliation were made, and it is hoped that eventually these and other bodies of employers in the building trade will be combined in taking united action in matters interesting to all those engaged in the industry.

An interesting discussion took place on this report, and the Council considered affiliation desirable, and appointed a committee, consisting of the president (Mr. F. G. Rice), Mr. Leonard Horner, Mr. G. Bird Godson, Mr. James S. Holliday, Mr. Frank May, Mr. Wm. Shepherd, Mr. B. I. Greenwood, and Mr. F. Higgs, to consider what terms to recommend for affiliation to the London Master Builders' Association of other bodies, and to report to the Council in due course.

The recommendations of the Rules Committee as to the amendment of the association rules were fully considered, and much interest was displayed in the consideration of them. The question of sub-contractors occupied a good deal of attention, and several glaring instances were given of what master builders have to put up with from many who are employed on work which could be done more quickly, with less interference with the organisation of the working of the job, and perhaps better, by the master builder himself. It was considered to be a great hardship on builders to be responsible for the work of sub-contractors, who do the work that they (the builders) have facilities and ability to carry out, and of whom they have no selection, and although it is admitted in some cases architects cease to employ sub-contractors whose want of consideration to the master builder warrants such a course, great hopes were expressed that architects would revert to the former practice of entrusting the master builder with the whole of the work formerly undertaken by him, and which would undoubtedly give him an added interest and pride in his work..

It was decided to hold the annual dinner on February 24th, and the President hopes to be well supported on that occasion.

The question of beginning work before the recognised "starting time" was considered.

It has for some time past been urged on the Council the desirability of issuing to its members a paper giving an official record of its proceedings, and on the motion of Mr. E. J. Brown, who pointed out that the "Builders' Journal" was the official organ of the National Federation of Building Trade Employers, it was decided to send that paper free for the ensuing twelve months to the ordinary members of this association.

HOUSE AT WARWICK. P. MORLEY HORDER, F.R.I.B.A., ARCHITECT.

BUILDING TENDERS AND CONTRACTS.

The following notice appears in the "Journal of the Royal Institute of British Architects" for January 22nd:—

On December 13th, 1909, deputations from the London Master Builders' Association and the National Federation of Building Trades Employers of Great Britain and Ireland were received at 9, Conduit Street by the President, Vice-presidents, and Hon. Secretary of the Institute.

Mr. Rice, president, and Messrs. Wm. Shepherd and Randall represented the London Master Builders' Association, and Mr. Ernest J. Brown, president, and Messrs. F. Smethurst, J. W. White, James Wright, F. Higgs, and W. Thomas represented the National Federation of Building Trades Employers of Great Britain.

The deputation stated that for some time a practice has been growing amongst architects in London and the provinces of asking builders to send in tenders for works without quantities being supplied to the builders upon which the tenders might be based. Secondly, that architects attempted to make a written acceptance of the tender an agreement binding the builder to sign a certain form of contract. Thirdly, that when quantities for the works were supplied to the builders, the latter were asked to deliver their priced schedules with the tenders.

With respect to the first point it was felt that sometimes unnecessary expense was thrown upon the builders in requiring each of them to take out the quantities necessary for the preparation of their estimates, and members of the Institute are recommended to have quantities prepared for all ordinary works above £500 in value. If the works are below £500 in value, it would be advisable for architects (if quantities are not supplied) to invite tenders from not more than two builders so as to reduce the cost of preparing estimates, this economy being ultimately beneficial to the client.

Wherever it is practicable for quantities to be prepared without unduly increasing the cost of the works, it is desirable that these should be supplied, but if in the discretion of the architect these quantities are not prepared, then the invitations to builders to tender should be restricted in number.

With reference to the second point, it was urged by the deputation that often there was no time for builders to read carefully through the form of contract before sending in the tender, and, therefore, that a written acceptance of the tender should not constitute a binding agreement to sign a form of contract to which exception might properly be taken.

The Institute representatives, while expressing no opinion upon the legality or otherwise of the practice above referred to, urged upon the deputation the great desirability of only signing the form of contract issued by the Institute.

The third point was exemplified by instances of public bodies and architects demanding the submission of priced bills of quantities along with the tender, with the grave risk of these being used in an unfair or improper manner.

It is, therefore, recommended that members of the Institute should not adopt this practice, but adhere to that set out in clause 3 of the conditions of contract issued by the Institute, and that they should do all in their power to stop the continuance by public authorities of the practice complained of.

JAMES S. GIBSON, Vice-President.

CARPENTERS' HALL LECTURES.

Art of Building, with Special Reference to the Use and Abuse of Building Materials.

Mr. Baillie Scott, lecturing on the above subject at the Carpenters' Hall, on Wednesday evening, remarked that nowadays when we speak of art we generally confine ourselves to pictures and statues. The art news of the newspapers have nothing to say about buildings; and while our modern buildings are defacing the countryside, our art is in the land of dreams and shadows. Whenever one sees an artist sketching in an old-world village, one realises how debased is our modern art. Of course, we have architecture in our midst, but this is now almost as much withdrawn from the main streams of art as the other arts.

The training which the young architect undergoes seems to imply that the whole of his architectural career is to be spent designing ambitious structures on antique models. The study of Greek temples will do little to enable us to fit ourselves to deal with small houses, as at Surbiton.

We should study the old cottages and farmhouses and forget the grand manner. I do not want to be impressed by empty grandeur. Build me a town where the houses of the people are comely and comfortable. Instead of grandeur I will put before you another and more worthy ideal—the ideal of romance. A building with a soul, in short. What power can be in bricks and mortar rightly handled! I know of numbers of buildings, manor houses, and farmhouses of the Tudor period, full of illusive charms. The walls may be hung with tapestry or merely whitewashed, it matters not. Everything is as surely right as everything in the modern building is surely wrong.

After a few slides of old buildings in Norfolk and elsewhere, the lecturer proceeded to deal with the materials used in building.

Stone, taken first, varied he said, according to the district in which it was found, and the old masons varied the treatment accordingly. In Surrey you often find the buildings decorated with a Mosaic of flints, etc. The modern mason always wants to improve on these, and can only give us an exaggerated concoction in the middle of each stone called "rock base." Our modern architect is obsessed by tradition and the grand manner: he can take no hints from the old methods. His masonry is the masonry of the drawing board and T square.

Consider the matter from the office point of view. Having got out the elevation and put in the openings, he sees if he cannot enrich the building with pilasters, mouldings, and carvings, and other elements dear to the office mind. It seems to me, he continued, that we are putting the cart before the horse. Instead of letting the material guide us and give us ideas, we do the design and settle the material later. Passing on to consider bricks and brickwork, he said: Every architect has in his office one of those bricks which are the manufacturer's pride and joy, perfectly even in form and colour; in fact, all that a brick should not be. A good brick should have the characteristic qualities of the material from which it is made. It should be of the earth, earthy. The mortar joints should not be a succession of mechanically ruled lines, and should be neither too dark nor too light. In roofing materials the most important quality is that of texture, and if tiles are used they should be thick. If new tiles have to be used they should have a texture which will weather rapidly, also that slight irregularity of form and surface which gives so charming an effect. There are at the present moment no tiles entirely satisfactory to the building artist. If it is impossible to obtain old tiles we had better choose a tile which will weather readily in a few years. Slates have a kind of harshness about them which renders them particularly suitable for breezy uplands and wind-swept stretches by the sea. Thatch, if treated with some fireproof preparation, is well adapted to small buildings. In using timber as a building material, the lecturer continued, it is wise to aim at securing some of those natural graces which belonged to it in its living form—the tree. Oak is best finished in most cases with the adze rather than the plane. Mahogany, rosewood, etc., should not be highly polished, but their surface should be just as much alive as the marble figure of the sculptor. Above all, we should avoid the crudeness of French polish. Wax polish gives a much better effect. In wood-carving, what suggestions has the material to offer? Our modern wood carver must be the means of bringing out the woodenness of the work. Old stuff has a sort of blunt nobbiness about it, but with the advent of the Renaissance, woodwork became just a means to producing the design of the carver. Grinling Gibbons is such a master of his tools that he has not interested himself in his timber. He only wants an accommodating material, so he works in soft wood. He gives us a lobster or a pair of pheasants reproduced with marvellous exactness. But art should move us to something better than that. So the work of Grinling Gibbons becomes only an object of curiosity, an example of mechanical skill.

The lecturer next showed us some examples of modern buildings, including a view of the courtyard of the ladies' flats at Hamp-

stead, designed by Mr. Baillie Scott, and a village hall in the Isle of Man.

It is a difficult matter, he continued, for a building artist to find a glazed tile that he can use. Most of them are unfortunate in pattern, and have a staring glassiness of glaze which renders them unsuitable. Certain makers have, however, done much to improve this. Where, then, is the perfect glazed tile to be found? Probably only in the old Dutch tiles. Beauty here has been obtained by the sympathetic use of the materials of which they are made, and an appreciation of their qualities. He expressed a hope that before long manufacturers would be able to give us such a tile. Of plaster, he said, Mr. Bankart will speak to you. No one has done more to revive its possibilities. As to its colour, it had better take the tint natural to the sand, but, if tinted, then let the colour be one which is natural to the material. Having dealt briefly with metals, namely, wrought and cast iron, the lecturer passed on to what he called that extremely revolutionary material, called ferro-concrete. If we are going to use ferro-concrete, he proceeded, let us be perfectly frank about it. Let the adornment both with and without be superficial in character. In Venice they adorned their walls with paintings. These would be unsuitable for our climate; but nothing could be better than mosaics. In the country local features could be introduced, namely, patterns of pebbles and flints. Several slides of modern German work were shown. Some of you here, he continued, think all this talk about art is not practical. More and more in this modern world we come to regard work as merely a means of getting money to buy our pleasures with. If we are going to spend the greater part of our lives in some pursuit, should we not try to get as much delight as possible out of it? In conclusion, let us try and evolve our art, as our fathers did, from natural conditions of climate and race.

Societies' Reports.

The Society of Engineers.

A prize, to be called the Status Prize, will be awarded by the Society of Engineers each year for the next four years, ending 1913 (if papers of sufficient merit are received) for the best paper written by any person on the subject "How to Improve the Status of Engineers and Engineering, with special reference to Consulting Engineers." The prize will consist of books and or instruments, of the value of three guineas, selected by the author of the premiated essay. The essay shall be written in the third person, shall contain not fewer than 4,000 nor more than 6,000 words, and shall be typed on one side only of foolscap paper, the distance between the lines being ⅜in. or more. All essays submitted in competition for this prize and the copyright therein shall become the property of the society, but the donor shall also have the right of publishing such essays or any part thereof. The Council of the Society may, at their discretion, permit the publication of any essay by its author, on such conditions as they may think fit to require. The premiated essay shall be read and discussed at a meeting of the Society, the reading being done by the author if possible, and such essay shall be published in the usual manner in the Society's Journal, the author being entitled to receive 50 copies of his paper upon publication thereof. The prize shall not be awarded to any member of Council or officer of the society. Essays sent in for competition must be received by the secretary, Mr. A. S. E. Ackermann, 17, Victoria Street, Westminster, on or before May 31st, in each year.

L.C.C. School of Arts and Crafts.

The following courses of lectures will be delivered at the L.C.C. Central School of Arts and Crafts, Southampton Row, during the term now commencing:—"The Technology of Leather, Paper, and Glue" (under the auspices of the Consultative Committee on Book Production), by Dr. Gordon Parker and Messrs. R. W. Sindall, F.C.S., and S. R. Trotman, M.A., F.I.C., on Thursdays, January 13th to March 3rd inclusive, at 7.30 p.m. "Metallurgy for Art Metal Workers," by Mr. Noel Heaton, B.Sc., F.C.S., on Wednesdays, January 12th to February 9th, at 8 p.m. A course on "Historic Arts and Crafts" will be delivered on Fridays at 6 p.m., as follows:—January 14th, "The Work of the Della Robbia," Mr. E. R. D. Maclagan; January 21st, 28th, "Embroideries," Mr. A. F. Kendrick; February 11th, 18th, "Lettering and Book Ornament," Mr. E. F. Strange; February 25th, March 4th, "Silversmiths' Work," Mr. W. W. Watts, F.S.A.; March 11th, 18th, "Ancient Textile Patterns," Mr. Alan S. Cole, C.B.; April 1st, "Illuminated MSS. and Early Printed Books," Mr. G. H. Palmer. Each lecture will be fully illustrated with lantern slides, etc., and admission is free to all persons interested. Full syllabuses and prospectus of classes can be had on application to the secretary at the school.

Leeds and Yorkshire Architectural Society.

At a meeting of the Society on January 13th, Professor S. D. Adshead, of Liverpool, introduced the subject of Town Planning with special reference to the Housing and Town Planning Act and its bearing upon suburban dwellings. Professor Adshead, in discussing the Act, pointed out to what extent the exercise of good-will and tact on the part of those concerned in negotiations would be required for its satisfactory administration. He urged the necessity for a unity of purpose, and warned against the danger of isolated areas being "town planned" without due reference to the whole, a possible result of a too literal reading of the Act.

Town Planning had in the past been largely responsible for the tastes and inclination of the working man. He was, unless taken in hand by his employer, either driven into a slum or catered for by the speculating builder, whose taste was the very worst. What could Town Planning do for him? With improved communications there was no reason why working men should not, if they so desired, live outside the town where land was plentiful and cheap and the pleasures of a garden could be enjoyed. So long as town dwellings were adhered to, these should be on the block system—an arrangement adapted in many ways to modern conditions.

Concerning the middle classes, here again a lack of appreciation of real art had rendered a ready prey to the speculating builder, who, while conforming to the by-laws, had produced monotonous rows of cubicles which attracted the unsophisticated with a thin veneer of respectability in the shape of sham ornament. The individual building owner had attempted to make his building the climax of the street. Self assertion had been unchecked. Thus, the Town Planning Act was destined to become one of the most important and consequential of all recent reforms.

For the future, a new beginning was impossible: we must make the best of what we possess. Terraces could be with little alteration converted into blocks of tenements, while stripped of its "ornament" the Mid-Victorian house might even attain to a stuccoed simplicity. The chief opportunity for real development, however, was offered by the outer ring of undeveloped land extending beyond our suburbs. Here, the choice of a suitable and utilitarian style for future buildings, suggested wide possibilities. There was much to be said for the pedimented villa of the Regency and Early Victorian periods, the fine simplicity of which combined with its compatibility with modern needs must appeal to the increasing artistic intelligence of the people. Referring to recent examples of suburban development, Professor Adshead pointed out that they must by no means be regarded as final results, but as experiments in a far reaching movement. There was much confusion of refinement with rusticity. These did not go necessarily hand in hand; the magnificent cottage did not suggest the residence of pretension; there was a limit to the stretching capabilities of the rustic cottage. In planning the residential quarter of a town, the occupation and taste, the tendencies either rusticated or refined of its prospective population must all be equally considered, and a disposition and an architecture evolved at once utilitarian, harmonious and beautiful.

The lecture was illustrated by plans and views having reference to town planning both in this country and abroad.

Birmingham Architectural Association and Birmingham Clerks of Works and Builders' Foremen's Association.

A joint visit was recently paid by the combined members of the above association to the new secondary schools at Yardley, recently erected by the Worcestershire County Council at a cost of about £25,000.

The parties were conducted over the buildings by Mr. Arthur Harrison, F.R.I.B.A. (the architect), Mr. Turberville (clerk of works to the County Council), and Mr. Harvey Gibbs (the contractor). The buildings are in the Georgian style, and are carried out with very fine deep-coloured red bricks, with artificial stone dressings, the roofs being covered with hand-made tiles. The interior of the main hall is beautifully finished with decorative plaster work, the whole forming an up-to-date school, complete in all modern conveniences and requirements.

There is an elevation to Warwick Road, but all rooms where quietude is essential are placed at the sides and in the rear, as far removed from the main road as possible.

The buildings consist of a central hall or assembly room, with class-rooms around, and consist of two floors—ground floor and first floor—the latter being of reinforced concrete laid with wood blocks. Besides the ordinary class-rooms there are an art studio, library, laboratary, gymnasium, dining-room, cookery room, cycle stores, etc.

At the conclusion of the inspection, a vote of thanks was accorded to Mr. Harrison, the architect, who was heartily congratulated. Votes of thanks were also accorded to the contractor, Mr. Harvey Gibbs, and to Mr. Turberville, the clerk of works, for their kindness in receiving the visitors.

Later in the afternoon the same party visited the new Primitive Methodist Church and buildings, lately erected in the same neighbourhood. The church, which is a large building in modern Gothic style, is constructed of red bricks and terra-cotta. There are also a Sunday school building, an institute and social meeting rooms, one of the principal features being an excellent billiard room. The whole of the buildings were designed by Mr. W. Harper, of Nottingham, and carried out by Mr. Harvey Gibbs. Both the design and workmanship were greatly admired and appreciated by the visitors, who expressed the pleasure and gratification which the visit had given them.

Messrs. Wailes, Dove and Co., Ltd., of Newcastle-on-Tyne, manufacturers of the patent "Bittumastic" enamels, have this month opened a new branch office at 49, Blackfriars Street, Manchester.

* * *

The Court of the Carpenters' Company, at their last meeting voted the sum of over £800 in donations and subscriptions to various charitable and other institutions. This sum is quite apart from the amount expended by this company on education, technical and otherwise.

* * *

Mr. William H. Thorp, F.R.I.B.A., has taken his son, Mr. Ralph W. Thorp, A.R.I.B.A., into partnership. The name of the firm in future will be William H. Thorp and Son, and will continue to practise as architects at Phœnix Chambers, South Parade, Leeds, as heretofore.

Coming Events.

Wednesday, January 26.

THE CARPENTERS' COMPANY LECTURES.—Mr. Banister Fletcher on "The Carpenters' Craft," 7.30 p.m.

MANCHESTER SOCIETY OF ARCHITECTS.—Professor S. H. Capper on "Truro."

CAMBERWELL SCHOOL OF ARTS AND CRAFTS.—Second day of Annual Exhibition of Students' Work at South London Art Gallery, 2 p.m. to 10 p.m. daily, until February 25th.

Friday, January 28.

THE ARCHITECTURAL ASSOCIATION DEBATING SOCIETY.—Church Architecture—Gothic v. Classic. Mr. W. G. B. Lewis and Mr. A. E. Bullock, 7 p.m.

INSTITUTION OF CIVIL ENGINEERS.—Students' Meeting. Mr. H. F. Donaldson on "Some uses of Mechanical Power in Engineering Construction," 8 p.m.

Saturday, January 29.

R.I.B.A.—Exhibition of Prize Competition Drawings, at the Alpine Club, closes.

THE ARCHITECTURAL ASSOCIATION.—Second Spring Visit to No. 8, Barton Street, Westminster. Members meet at the house, 2 p.m. Visit afterwards (limited to 30 members) to No. 34, Queen Anne's Gate, S.W. Tickets from the Secretary.

Monday, January 31.

R.I.B.A.—President's address to students. Presentation of prizes and studentships. Announcement of Council's nomination for the Royal Gold Medal. Announcement of nomination of candidates for membership. Election, February 28.

THE SURVEYORS' INSTITUTION.—Junior Meeting. Discussion on "Leasehold Enfranchisement," 7 p.m.

Tuesday, February 1.

UNIVERSITY EXTENSION LECTURES ON ANCIENT ARCHITECTURE.—Mr. Banister Fletcher on "Roman Architecture—Theatres and Amphitheatres," British Museum, 4.30 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION.—Council meeting, 7 p.m. Ordinary meeting, 7.30 p.m. Paper by Mr. George Hubbard.

Wednesday, February 2.

CARPENTERS' COMPANY LECTURES.—Sir Brumwell Thomas, on "The Joiners' Craft," Carpenters' Hall, 7.30 p.m.

Friday, February 4.

ARCHITECTURAL ASSOCIATION.—Mr. W. H. Ward, on "Renaissance Church Architecture in France during the 16th Century," 7.30 p.m.

LEICESTER AND LEICESTERSHIRE SOCIETY OF ARCHITECTS.—Mr. Arthur Marshall on "Some Spanish Places and People," 8 p.m., at 5, St. Martins East.

Saturday, February 5.

ABERDEEN ARCHITECTURAL ASSOCIATION.—Discussion meeting. Mr. H. F. David, on "Alfred Stevens: his life and work," 7.30 p.m.

Monday, February 7.

THE ROYAL SANITARY INSTITUTE LECTURES.—Dr. Charles Porter on "Sanitary Law," 7 p.m.

THE SURVEYORS' INSTITUTION.—Mr. T. A. Dickson on "The Report of the Royal Commission on the Poor Laws," 8 p.m.

Tuesday, February 8.

UNIVERSITY EXTENSION LECTURES ON ANCIENT ARCHITECTURE.—Mr. Banister Fletcher on "Roman Circi, Triumphal Arches and Town Gateways," British Museum, 4.30 p.m.

Wednesday, February 9.

CARPENTERS' HALL LECTURES.—Mr. Arthur Stratton on "Native Craftsmanship in Timber, Brick, and Stone, before the 18th Century," 7.30 p.m.

THE ROYAL SANITARY INSTITUTE LECTURES.—Dr. Charles Porter on "Sanitary Law," 7 p.m.

Friday, February 11.

THE ARCHITECTURAL ASSOCIATION DEBATING SOCIETY.—(Joint Meeting with the Junior Institution of Civil Engineers). Mr. F. R. Durham, A.M.Inst.C.E., on "Architectural and Engineering Consideration Town Planning," 7 p.m.

THE ROYAL SANITARY INSTITUTE LECTURES.—Dr. Charles Porter on "Sanitary Law," 7 p.m.

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS (Southampton Row, W.C.).—Mr. E. F. Strange on "Lettering," 8 p.m.

Monday, February 14.

THE ROYAL SANITARY INSTITUTE LECTURES.—Mr. Wellesley Harris on "The Duties of a Sanitary Inspector," 7 p.m.

Tuesday, February 15.

UNIVERSITY EXTENSION LECTURES ON ANCIENT ARCHITECTURE.—Mr. Banister Fletcher on "Roman Tombs, Pillars of Victory, Aqueducts, and Bridges," British Museum, 4.30 p.m.

Wednesday, February 16.

CARPENTERS' HALL LECTURES.—Mr. Lawrence Weaver on "The Art of the Leadworker," 7.30 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION.—Students' Meeting. Mr. W. Milburn, jun., on "Notes on Continental Hospitals," 7.30 p.m.

Thursday, February 17.

THE ROYAL SANITARY INSTITUTE LECTURES.—Mr. Wellesley Harris on "The Duties of a Sanitary Inspector," 7 p.m.

Friday, February 18.

THE ARCHITECTURAL ASSOCIATION.—Mr. E. Swinfen Harris on "The Life and Work of William Butterfield," 7.30 p.m.

THE ROYAL SANITARY INSTITUTE LECTURES.—Mr. Wellesley Harris on "The Duties of a Sanitary Inspector," 7 p.m.

LEICESTER AND LEICESTERSHIRE SOCIETY OF ARCHITECTS.—Mr. S. Perkins Pick on "Drainage and Sanitary Fittings," 8 p.m. at 5, St. Martin's East.

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS (Southampton Row, W.C.).—Mr. E. F. Strange on "Book Ornament," 6 p.m.

Saturday, February 19.

ABERDEEN ARCHITECTURAL ASSOCIATION.—Mr. J. A. Ogg Allan on "A Recent Architectural Tour in the United States," 7.30 p.m.

Tuesday, February 22.

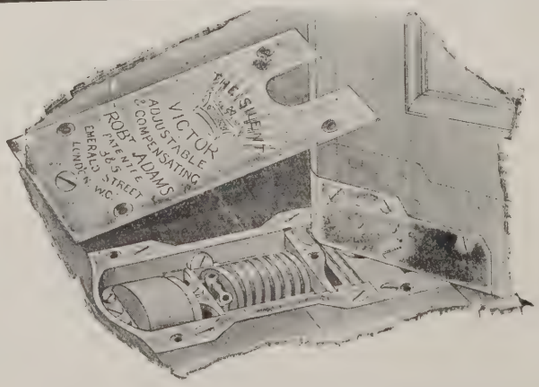
UNIVERSITY EXTENSION LECTURES ON ANCIENT ARCHITECTURE.—Mr. Banister Fletcher on "Palaces of the Roman Emperors, Roman Dwelling-houses; Pompeii and Pompeian Decoration," British Museum, 4.30 p.m.

Wednesday, February 23.

CARPENTERS' HALL LECTURES.—Mr. Geo. P. Bankart on "The Art of the Plasterer," 7.30 p.m.

Friday, February 25.

THE ARCHITECTURAL ASSOCIATION DEBATING SOCIETY.—"That the Employment of a Quantity Surveyor is to the Interest of the Building Owner," Mr. Percy Gleed, R.A.S.I., for; Mr. S. L. Dale, A.R.I.B.A., against, 7 p.m.



CAMBERWELL SCHOOL OF ARTS AND CRAFTS.—Annual Exhibition of Students' Work at South London Art Gallery, closes at 10 p.m.

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS (Southampton Row, W.C.).—Mr. W. W. Walts' First Lecture on "The History and Development of English Silversmiths' Work," 6 p.m.

Messrs. H. J. Skelton and Co., Royal London House, Finsbury Square, London, E.C., announce that owing to the increasing growth of their business they have decided, for greater convenience of management, to transfer to a separate company their business in broad flange beams. The transfer was made on January 15th, 1910, but took effect as from January 1st. The name and address of the new company is R. A. Skelton and Co., Moorgate Station Chambers, Moorfields, London, E.C. Telephone: 4635 London Wall (2 lines). Telegrams: "Skeltonica, London." Codes: A.B.C., Liebers, and Western Union. The two companies will be independent concerns; Mr. R. A. Skelton assumes the sole control and management of the new firm, and retires from H. J. Skelton and Co. for that purpose. It is requested that in order to avoid delay all correspondence relating to broad flange beams may be addressed direct to the new firm, who take over all outstanding contracts, agreements, and correspondence of the "D" Dept. Remittances in payment of "D" Dept. accounts dated January 1st, 1910, or subsequently, should in like manner be made out and forwarded direct to R.A. Skelton and Co., whose business in broad flange beams will be conducted precisely as heretofore, by the same staff and under the same management.

15 GOLD MEDALS AWARDED.

SPECIALITY:
"ETERNIT" Terra-cotta Tiles, which neither break nor crumble, and at half the cost of Staffordshire Tiles, double the strength and about one-third of the weight.
Prompt Delivery.
Speedy fixing.
No breakages.

G. R. SPEAKER & Co., ENGINEERS,

Smooth on both sides. Roofs covered with "Eternit" Tiles weigh about 22 lbs. per square yard, or 66⅔ lbs. lighter weight per square yard than Bangor Slates. Greater mechanical and tensile strength. Non-Conducting. Non-Combustible. Impervious to sun, heat, frost and rain. Wind, dust and weather tight.

G. R. SPEAKER & Co., CONTRACTORS,

For enduring roofing material and workmanship,

Architects, Engineers & Surveyors

are respectfully recommended to specify

ETERNIT

REGISTERED TRADE MARK 1904.

Guaranteed and manufactured under Hatschek's Original Specification and to decline all substitutes. No other roofing tile is "ETERNIT." (Regd.)

WRITE FOR SAMPLES AND FOR TENDERS FOR FIXING.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about **five days** after the date of this issue.
Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders.
The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the Contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Jan. 27. **ILFORD, ESSEX.**—Erection of a hospital at Newbury Park, Ilford, Essex. Plans and specification, prepared by the Architect, R. Banks-Martin, M.S.A., of 121, Plashet Grove, East Ham, E., and conditions of contract may be inspected at his office on and after Jan. 31. Any person desiring to tender and receive copy of bills of quantities must send in his name to the Architect, accompanied by a deposit of a £10 Bank of England note, not later than noon on 27th inst.

Jan. 28—Feb. 7. **DEVONPORT.**—Erection of nursing staff quarters and reconstruction of the military families hospital, at the Raglan Barracks, Devonport, in the Southern Command, for the Secretary of State for War. Plans, specification, and conditions of contract may be inspected at the office of the Director of Barrack Construction, 80, Pall Mall, London, S.W., or at the Barrack Construction Office, Old Granby Barracks, Devonport, up to Jan. 26. Those desiring to tender and to receive a copy of the bills of quantities must apply to the Director of Barrack Construction not later than Jan. 28. The application must be accompanied by a deposit of 10s. Cheques or orders to be made payable to the Assistant Financial Secretary and crossed "Bank of England for credit to Army Funds." Tenders must be delivered to H. De la Bere, Director of Army Contracts, War Office, Whitehall, London, S.W.

Jan. 28—Feb. 7. **DUBLIN.**—Erection of mortuary and disinfecting establishment, Arbor Hill Hospital, Dublin, in the Irish Command, for the Secretary of State for War. Plans, specification, and conditions of contract may be inspected at the office of the Director of Barrack Construction, 80, Pall Mall, London, S.W., or at the Barrack Construction Office, Arbor Hill Hospital, Dublin, on Jan. 24, 25, and 26. Those desiring to tender and to receive a copy of the bills of quantities must apply to the Director of Barrack Construction not later than Jan. 28. The application must be accompanied by a deposit of 10s. Cheques or orders to be made payable to the Assistant Financial Secretary and crossed "Bank of England for credit to Army Funds." Tenders must be delivered to H. De la Bere, Director of Army Contracts, War Office, Whitehall, London, S.W. The bills of quantities should accompany tender in a separate sealed envelope, similarly addressed.

Jan. 28—Feb. 7. **ABERDEEN.**—Execution of mason, carpenter, slater, and plaster works of the following buildings:—Tarves:—1, James Lewis, Old-mill of Schivas, dwelling house; 2, John Bruce, Hunkerhill, dwelling house; 3, Mrs. Scorgie, Court-stone, additions to dwelling house; 4, W. G. Smith, Upper Kirton, dwelling house. Methlick:—5, John Beaton, Brownhill, dwelling house; 6, George Gibb, Newton, dwelling house; 7, James Coutts, Cairn-orrie, dwelling house; 8, George Simpson, Belnag-oak, dwelling house. Fyvie:—9, John P. Sleigh, St. John's Well, cottage; 10, Alexr. Chalmers, Swan-ford, dwelling house; 11, George Young, Little Gight, dwelling house; 12, James Taylor, Blackhil-lock, dwelling house; 13, Peter Castle, Clovery, dwelling house; 14, John Forsyth, Blackpool, dwel-ling house. New Deer:—15, James Ironside, Myre of Bedlam, additions to house. Contractors for Swanford should meet the architect there on 28th inst., at 1 p.m. Plans and specifications may be seen with the tenants and at the estate office. Sealed tenders to be lodged with Charles G. Smith, Factor, Haddo House.

Jan. 29. **LEEDS.**—Contractors desirous of tendering for the bricklayers' and masons', carpenters' and joiners,, plumbers', plasterers', slaters', painters', ironfounders' work, and hot-water heating, required in the erection of new dining-hall at the Union Workhouse, Beckett Street, Leeds, can view the plans and specification, and obtain quantities on application to the Architect, G. Fredk. Bowman, 5, Greek Street, Leeds, from Jan. 24 to 29.

Jan. 29—Feb. 9. **REDFORD.**—Execution of the following work, for the Secretary of State for War:—Foundation work for barrack block, excavating and levelling site for new cavalry barracks, Red-ford, in the Scottish Command. Plans, specifica-tion, and conditions of contract may be inspected at the Office of the Director of Barrack Construc-tion, 80, Pall Mall, London, S.W.; or at the Tem-porary Barrack Construction Office, Colinton, on Jan. 27. Those desiring to tender and to receive a copy of the bills of quantities must apply to the Director of Barrack Construction not later than Feb. 1, accompanied by a deposit of 10s. Cheques or orders to be made payable to the Assistant Financial Secretary, and crossed "Bank of England for credit to Army funds." Tenders must be de-livered, addressed to the Director of Army Con-tracts, War Office, Whitehall, London, S.W.

Jan. 31. **CARTMEL (Lincs.).**—Alterations and additions to the King's Arms Hotel, Cartmel, for E. Sattenstall. Bills of quantities may be obtained from and drawings inspected at the office of J. W. Grundy and Son, Architects and Surveyors, Central Buildings, Ulverston.

Jan. 31. **SHEFFIELD.**—Extension of women's hall of residence, Ecclesall Road and Collegiate Crescent; also heating apparatus and electric in-stallation, for the Corporation. Plans and specifi-cations may be seen and copies of the bills of quantities obtained on application at the offices of the Architects, Gibbs, Flockton, and Teather, 15, St. James' Row, Sheffield. Tenders to be delivered at Education Office, Leopold Street, Sheffield. Fair wages and sub-letting clauses.

Jan. 31—Feb. 19. **PAULTON (near Bristol).**—Erection of church house, for the Committee. Builders desirous of tendering should, before the 31st inst., send their names to the Rev. S. Herbert, The Vicarage, Paulton. Plans and specifications may be seen at the Rev. S. Herbert's, or Melhuish and Sons, on and after Feb. 4. Bills of quantities may be obtained on deposit of £1 1s. Tenders are to be delivered to the Rev. S. Herbert.

Feb. 1. **BROMLEY.**—Erection of a lodge on the Whitehall Recreation Ground, Bromley, for the Corporation. Drawings and specification may be seen at the office of the Borough Engineer, Munici-pal Buildings, Bromley, from whom copies of the bill of quantities may be obtained on deposit of £1 1s. Tenders to be delivered to Fred. H. Nor-man, Town Clerk, Municipal Offices, Bromley.

Feb. 1. **LONDON, N.W.**—Erection of fire proof screens at the children's receiving home, Tren-mar Gardens, College Park, N.W., for the Guar-dians of the Poor of the parish of Paddington. Specification and form of tender may be obtained at the offices of the Architect, E. Howley Sim, Mowbray House, 14, Norfolk Street, Strand, W.C., on deposit of cheque £1. Tenders must be de-livered to Henry F. Aveling, Clerk to the Guardians, 313-319, Harrow Road, W. Fair wages clause. Local men.

Plans, specifications, and bills of quanti-ties may be seen at the Architect's office and at the Council Offices, East Molesey. Applications for bills of quantities and forms of tender to be made to the Clerk to the Council, and can be obtained upon deposit of £1 1s. Tenders, addressed to the Chairman to the Isolation Hospital Committee, to be sent to D. Cann, Clerk to the Council, Council Offices, Dundee Villa, East Molesey.

Feb. 4. **TRENCH, SALOP.**—Erection of six cot-tages and six sets of farm buildings for small hold-ings at the Trench, about two miles from Ellesmere Station, for the C.C. Plans and specifications can be inspected, and quantities and form of ten-der may be obtained, at the office of the Agent, Wm. T. Hall, College Hill, Shrewsbury, on deposit of £2 2s. Tenders should be delivered to E. Cress-well Peele, Clerk to the Salop County Council, Shire-hall, Shrewsbury.

Feb. 4. **MARSDEN (near Huddersfield).**—Persons desirous of tendering for any or all of the various works required in the erection of a tower to St. Bartholomew's Church, Marsden, near Hudders-field, may see the drawings, and obtain bills of quantities at John Kirk and Sons' offices, from Jan. 28 to Feb. 4. Tenders must be delivered to C. Hodgson Fowler, F.S.A., and John Kirk and Son, Joint Architects, John William Street, Hudders-field.

Feb. 4. **WAKEFIELD.**—Execution for the West Riding Education Committee of the following works:—Bradfield, Oughtbridge provided school; alter-ations (builder, joiner, plumber, and painter). Plans may be seen and specifications with quantities ob-tained on application to the Education Architect, County Hall, Wakefield. A deposit of £1 in each case must be sent by separate letter to the West Riding Treasurer, County Hall, Wakefield. Tenders to be sent to Francis Alvey Darwin, Clerk of the County Council, County Hall, Wakefield.

Feb. 4. **WAKEFIELD.**—Execution of the follow-ing works for the West Riding Education Com-mittee:—Thornton-in-Craven, Earby New School (builder, joiner, slater, plasterer, plumber, painter). Plans may be seen and specifications with quanti-ties obtained on application to the Education Archi-tect, County Hall, Wakefield. £1 deposit must be sent by separate letter to the West Riding Trea-surer, County Hall, Wakefield. Tenders must be sent to Francis Alvey Darwin, Clerk of the County Council, County Hall, Wakefield.

Feb. 5. **BEVERLEY, YORKS.**—Alterations to house and buildings at West End Farm, South Cave, for the East Riding of Yorkshire County Council. Specifications and forms of tender may be obtained from the Clerk of the County Council, County Hall, Beverley. Tenders are to be sent to John Bickersteth, Clerk of the said County Council, County Hall, Beverley. Plans may be seen at the West End Farm, South Cave, and also at the County Hall, Beverley.

Feb. 7. **MARGATE.**—Alterations to cottages at the Wingham pumping station, and the redecora-tion of the interiors. Plan and specification can be seen and all further particulars obtained on appli-cation to E. A. Borg, Borough Surveyor, 13, Gros-venor Place, Margate. Tenders should be sent to Edward Brooke, Town Clerk, Margate.

Feb. 7. **DONABATE (Ireland).**—Erection of a station building at Donabate; also a goods store at Annvale Siding, near Keady Station, for the Great Northern Railway Company (Ireland). Plans and specifications at the office of F. A. Campion, Chief Engineer, Amiens Street Terminus, Dublin, or copies at the office of the District Engineer, Bel-fast, and can obtain at the offices forms of tender on payment of 1s. each (not returnable). Tenders should be delivered to T. Morrison, Secretary, Secretary's Office, Amiens Street Terminus, Dublin.

Feb. 7. **PETTAUGH (near Stowmarket).**—Erection of a new school for about 60 children at Pettaugh, near Stowmarket, for the East Suffolk County Education Committee. Builders who desire to tender should send in their names, accompanied by a deposit of £1 1s. (cheques to be made payable to W. E. Watkins), by 8th inst., to W. E. Watkins, Secretary, Education Office, County Hall, Ipswich, to whom tenders are to be sent.

Feb. 7. **CARDIFF.**—Erection of proposed riding school and stabling, on the Barracks Field, Cardiff, for the Glamorgan County Territorial Force Association. Plans and specification to be inspected at the office of the Architect, W. H. Dashwood Caple, F.R.I.B.A., 2, Church Street, Cardiff. Copies of the bills of quantities may be obtained on deposit of £1 1s. Tenders to be delivered to Capt. C. J. Wilkie, Secretary, 20, Dumfries Place, Cardiff.

Feb. 7. **ENFIELD.**—Construction of pumping station buildings, together with chimney, stores, coal bays, cottage, broadway, drainage, and other contingent works, at Hadley Road, Enfield, for the Metropolitan Water Board. Drawings, conditions of contract, and specifications may be inspected at the offices of the Chief Engineer, Savoy Court, Strand, W.C. Contractors desirous of tendering may obtain forms of tender, conditions of contract, specifications, list of drawings, bills of quantities, etc., from the Chief Engineer, on the production of an official receipt for the sum of £10, which must be deposited with the Accountant at Savoy Court, Strand, W.C. Tenders must be delivered to Offices of the Board, Savoy Court, Strand, W.C.

Feb. 8. **CROSSKEYS, MON.**—Erection of a workmen's institute at Crosskeys, Mon. Plans and specifications may be seen at the office of R. L. Roberts, M.S.A., Abercarn. Quantities supplied on deposit of £2 2s. Sealed tenders, endorsed "Tender for Institute," to be delivered to John Woodward, Crosskeys.

Feb. 8. **LINCOLN.**—Construction of engine-house, boiler-house, economiser-house, coal store, workshop, and stores, forming the main building; and also of chimney, engineer's house, cottages, and subsidiary works, at Elkesley, Notts., 2¾ miles from Checkerhouse Station, and six miles from Retford, for the Corporation. Drawings may be seen, and specification, bill of quantities, and form of tender obtained at the office of the Engineer, Neil McK. Barton, Waterworks Engineer, Lincoln, upon production of a receipt from the City Accountant for £5 5s. deposit. Tenders, addressed to the Chairman of the Waterworks Committee, to be delivered at the office of W. T. Page, Deputy Town Clerk, Bank Street, Lincoln.

Feb. 9. **LLANFAIR, P.G.**—Erection of a new Council school at Llanfair, P.G., for the Anglesey Education Committee. Plans and specifications may be inspected with Jos. Owen, F.R.I.B.A., County Architect, Menai Bridge. Tenders to be sent in to R. H. Williams, Secretary of Education, Education Offices, Llangefni.

Feb. 10. **TORQUAY.**—Erection of a new Post-Office at Torquay, for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions, and form of contract may be seen on application to the Postmaster, Torquay. Bills of quantities and forms of tender may be obtained at the undermentioned address, on deposit of £1 1s. Tenders must be delivered to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

Feb. 16. **HOMERTON, N.E.**—Erection of pavilion "C" at the Infirmary at Homerton, N.E., for the Hackney Union. Applications for bills of quantities and forms of tender should be made, accompanied by a deposit of £5, before Jan. 31, to Frank R. Coles, Clerk to the Guardians, to whom tenders are to be sent. The contractor will be required to give approved security. The form of bond and plans may be seen at the Guardians' Office, Sidney Road, Homerton, N.E.

Feb. 16. **NEWPORT (Mon.).**—Re-covering with zinc or copper part of the roof of the general markets, for the Corporation. The portion to be dealt with has an area of about 8,200 superficial feet. A sectional drawing of the roof, together with general specification, may be obtained from R. H. Haynes, Borough Engineer, on production of a receipt from the Borough Treasurer for £1 1s. Tenders to be forwarded to the Town Clerk, Town Hall, Newport. Fair wages clause.

No date. **EBRINGTON (GLOS.).**—Enlargement of the elementary school at Ebrington, Gloucestershire. Plans and specifications can be obtained of the Official Correspondent, M. A. Sands, Ebrington Hall, Campden.

No date. **EPPERSTONE.**—Persons desirous of tendering for alterations and additions to Woodborough Mill Farm Buildings, Epperstone, for Sir Francis Ley, Bart., may obtain quantities on deposit of £1 1s., from E. R. Ridgway, Architect, Long Eaton.

No date. **SHERBURN-IN-ELMET.**—Execution of the builder and plumber's work required in minor alterations at the Sherburn-in-Elmet provided school. Specification and quantities may be obtained on application to Robert J. Smith, Education Offices, Garforth, near Leeds.

No date. **KEIGHLEY.**—Contractors desirous of tendering for the various works in the erection of business premises and works, off Spring Street, Lawkholme Lane, Keighley, for the Rustless Iron Co., are requested to forward their names to David W. Weatherhead, Architect and Surveyor, Low Street, Keighley. Bills of quantities will be supplied when ready.

ENGINEERING.

Jan. 31. **CARDIFF.**—Construction and maintenance of an elliptical skew-arch bridge, 60ft. span, over the River Rumney, in lieu of the existing masonry bridge, which is to be removed, and execution of certain road works in connection therewith, for the C.C. Contract drawings and deed of contract may be inspected and form of tender, specification, and bill of quantities obtained at the City Engineer's Office, City Hall, Cardiff, upon deposit with the City Treasurer of £3. Tenders are to be delivered at the office of the Town Clerk, City Hall.

Feb. 1. **LONDON (for India).**—Supply of bridge-work for the Secretary of State for India. Conditions of contract may be obtained on application to the Director-General of Stores, India Office, Whitehall, S.W. Tenders are to be delivered at that office.

Feb. 2. **BRIDGEND.**—Supply, delivery and erection of (a) one new Lancashire boiler; (b) a central heating apparatus, for the Parc Gwyyt Asylum near Bridgend, Glamorgan, for the Committee. Specifications, with general conditions and forms of tender, may be obtained from the undersigned on deposit of £2 2s. for each specification. Drawings may be seen at the offices of the Consulting Engineer, Herbert T. Sully, Scottish Widows Buildings, Bristol, or at the Glamorgan County Offices, Cardiff. Tenders to be sent to W. E. R. Allen, Clerk to the Committee of Visitors, Glamorgan County Council Offices, Westgate Street, Cardiff.

Feb. 7. **NOTTINGHAM.**—Excavating and timbering pipe trenches between boreholes and receiving well; also constructing valve chambers at Burton Joyce pumping station, near Nottingham, for the Corporation. Drawings may be seen and copy of specification, and form of tender obtained on application to F. W. Davies, Water Engineer, St. Peter's Church-side, Nottingham, on deposit of £1 1s. Tenders to be sent to J. A. H. Green, Town Clerk, Guildhall, Nottingham.

Feb. 9. **ASHTON-UNDER-LYNE.**—Execution of the following works, for the Corporation:—Section A, one counter current jet condensing plant; section B, one natural draught cooling tower; section C, one exhaust turbine and 400-kw. direct current generator; section D, one electric balancer. Copies of the specification and form of tender can be obtained from the Borough Electrical Engineer, Wellington Road, Ashton-under-Lyne, on deposit of £1 1s. Tenders must be sent to John Neal, Borough Comptroller, Town Hall, Ashton-under-Lyne.

Forms of tender and further information may be obtained on application to J. Wilkinson, F.C.S., Engineer, Gasworks, Halifax. Tenders must be sent to Herbert Ashling, Town Clerk. Fair wages clause.

Special Annual Issue of "THE ARCHITECTURAL REVIEW."

"Recent English Domestic Architecture," 1909.

PRICE **5/-** NETT.

THROUGHOUT the domain of Architecture, English Domestic Work is of acknowledged supremacy. It is the admiration of all countries, and is one product, at least, in which British Architects hold undisputed pre-eminence. The Domestic Work designed during the past few years by our leading Architects has shown progressive volume and interest, and this continuous development has coincided with and has, no doubt, greatly encouraged a remarkable growth of artistic taste among the laity, as well as in the Architectural Profession.

Month by month, specimens of noteworthy Domestic Work are shown in "THE ARCHITECTURAL REVIEW"; but necessarily only a limited number of examples can be represented through that medium.

The Publishers have much pleasure in announcing that the above Special Issue is now ready. It comprises a collection of choice examples of Recent Domestic Work by Architects who have achieved distinction in this class of design. The examples are not restricted to any particular school or style, intrinsic merit being the only test.

TECHNICAL JOURNALS, Ltd.,

QUANTITIES and specifications prepared by experienced surveyor, quick and accurate; reasonable terms.—Box 5484, BUILDERS' JOURNAL Office.

REINFORCED Concrete.—A specialist is prepared to give instruction in practical applications of structural design to reinforced concrete. — Apply, A.M.I.C.E., Box 5453, BUILDERS' JOURNAL Office.

REINFORCED Concrete.—Experienced estimator and Surveyor seeks engagement with firm of contractors; designs, quantities, estimates, supervision, good organiser and manager; age 31.—Box 5496, BUILDERS' JOURNAL Office.

REINFORCED Concrete Expert to Jamaican Government for re-building Kingston, has controlled since December, 1907, design and erection work representing expenditure several hundred thousand pounds, seeks an appointment.—J. Edge Taylor, Clevedon, Somerset. 5461.

TIMEKEEPER, Storekeeper, or Yard Foreman seeks re-engagement; town or country; well up in materials and plant; good references.—R. C., Upton Cottage, Carlyle Road, South Ealing. 5467

TYPEWRITING Architect's Specifications and Reports, a speciality; sketches inserted; all work cheaply and promptly executed; estimates given.—Address, "Typist," 2, Marsham Street, Westminster. 5489

WORK'S Inspector (Buildings), London surveyor's representative, estimates, redecorations, experience in sanitation, plumbing, concrete construction, work at least cost; good manager, timekeeper; trustworthy references. —Robert, 119, Felsham Road, Putney. 5463

Appointments Vacant.

APPLICATIONS for Appointments arranged effectively; appreciated by recipients; numerous unsolicited testimonials. — Write now, Herbert Greatorex, Hackney, Matlock.

COMPETENT Joiner or Machinist wanted, energetic, to act as confidential man and worker; must invest £30; safe return given and permanency.—Apply, A. J. Co., 141, Kensal Road, Westbourne Park.

REINFORCED Concrete Foreman wanted for Lancashire district, one who has had experience with "Hennibique" or "Coignet" construction preferred. —Apply, Box 5485, BUILDERS' JOURNAL Office.

SARUM Wrought Iron Works.—Smith wanted for about three months; must be good at ornamental foliage work.—Apply, stating wages and particulars, Miss Purvis, The Close, Salisbury.

STEADY Working Foreman wanted, accustomed to managing men and estimating for decorations and general interior work; West-end experience; good references necessary.—Apply by letter only, Storey and Co., Kensington High Street, W.

YOUNG Man of good address wanted, aged about 23 years, to solicit orders in the monumental business, and fill up time in showroom, etc.; one with a knowledge of the trade preferred; good cyclist; wages 20s. per week and commission.—Apply, B. and W. Bennett, South Gate, Chichester.

Reinforced Concrete.

Designs, plans, etc., prepared by a specialist, for any kind of construction, according to client's requirements, and not necessarily on any particular system.—Apply, Box 5460, BUILDERS' JOURNAL Office.

Miscellaneous.

BRICKS, best Belgian, three sizes, strong and well made, pretty colourings, absolutely water and fire proof; also **TILES**; prices upon application to P. Rapaert de Grass, Santa Koro, Shanklin, I.W.

For **ELECTRIC COPIERS** and
Daylight Printing Frames,
Try B. J. HALL AND CO., LTD.,
39, Victoria Street, Westminster.

"JOHN BULL" BRAND.—Duplicators, Carbon Papers, Ribbons, Printing, Stationery, and complete office outfits.—Write, Read Manufacturing Co., 63, Finsbury Pavement.

POLING Boards, selected lengths and thicknesses, best quality and full measure; also scaffold boards, putlogs, scantlings, deals, batten and boards; lowest wharf prices.—C. H. Glover and Co., Ltd., Importers, Hatcham Saw Mills, Old Kent Road, S.E.

SECOND-HAND Optical Mart.
For the Purchase and Sale of
LEVELS, THEODOLITES, DRAWING INSTRS.
—Clarkson's, 338, High Holborn, London, W.C.
(Opposite Gray's Inn Road).

Property to be Let or For Sale.

Re Albert Odell.—In Bankruptcy.
WEST DRAYTON, COWLEY, AND LANGLEY.
To Brickmakers, Gravel and Dust Contractors.

MESSRS. BUCKLAND AND SONS have received instructions from H. Wingfield, Esq., the Official Receiver, to SELL by AUCTION, at the DE BURGH ARMS, West Drayton, on THURSDAY, JANUARY 27, 1910,

About 3¼ acres of FREEHOLD BUILDING LAND at Horton Road, Yiewsley, FREEHOLD BRICKFIELD, with plant and large deposit of gravel in Trout Field, Cowley, about 6¾ acres.

FREEHOLD BALLAST PIT and SPOIL BANK near last, now made suitable for agricultural and market garden purposes, about 5½ acres.

About 16 acres FREEHOLD LAND opposite, on north side of canal, containing gravel and ballast, now being worked to a depth of about 20ft., with the plant for ballasting, etc.

The LEASE of the well-placed Brickfield adjacent to the G.W.R. station at Langley, and abutting on the Grand Junction Canal.

Particulars and conditions of sale of H. Wingfield, Esq., 67 and 69, Watling Street, E.C.; Messrs. Herbert Reeves and Co., Solicitors, 42, Old Broad Street, E.C.; and of the Auctioneers, 4, Bloomsbury Square, W.C., Slough, and Windsor.

Contracts Open.

WAR DEPARTMENT CONTRACT.

The Secretary of State for War hereby invites Tenders for the following work:—The erection of Nursing Staff Quarters and reconstruction of the Military Families Hospital at the Raglan Barracks, Devonport, in the Southern Command.

Plans, Specification and Conditions of Contract, may be inspected at the office of the Director of Barrack Construction, 80, Pall Mall, London, S.W., or at the Barrack Construction Office, Old Granby Barracks, Devonport, on Monday, Tuesday and Wednesday, January 24th, 25th and 26th.

Those desiring to tender and to receive a copy of the Bills of Quantities must apply to the Director of Barrack Construction not later than Friday, January 28th. The application must be accompanied by a deposit of ten shillings, which will be returned if a bona-fide tender is received from the applicant. Cheques or orders to be made payable to the Assistant Financial Secretary, and crossed "Bank of England for credit to Army Funds."

Tenders on the form supplied with the Bills of Quantities must be delivered in sealed envelopes marked "Tender for Nursing Staff Quarters and Reconstruction of Hospital, Devonport," not later than 12 noon on Monday, February 7th addressed to the Director of Army Contracts, War Office, Whitehall, London, S.W. The Bills of Quantities should accompany tender in a separate sealed envelope, similarly addressed and marked "Bills of Quantities, Nursing Staff Quarters and reconstruction of Hospital, Devonport," with the Contractor's name and address thereon.

The Secretary of State does not bind himself to accept the lowest or any tender.

(Signed) H. DE LA BERE,
Director of Army Contracts.

War Office,
Whitehall, London, S.W.
January, 1910. 5480

WAR DEPARTMENT CONTRACT.

The Secretary of State for War hereby invites Tenders for the following work:—In foundation work for Barrack Block, excavating and levelling site for new Cavalry Barracks, Redford, in the Scottish Command.

Plans, Specifications and Conditions of Contract, may be inspected at the Office of the Director of Barrack Construction, 80, Pall Mall, London, S.W., or at the temporary Barrack Construction Office, Colinton, situated between North end of Patties Road and Mill, on Thursday, Friday and Saturday, January 27th, 28th and 29th.

Those desiring to tender and to receive a copy of the Bills of Quantities must apply to the Director of Barrack Construction not later than Tuesday, February 1st. The application must be accompanied by a deposit of ten shillings, which will be returned if a bona-fide tender is received from the applicant. Cheques or orders to be made payable to the Assistant Financial Secretary and crossed "Bank of England for Credit to Army Funds."

Tenders on the form supplied with the Bills of Quantities must be delivered in sealed envelopes marked "Tender for Foundations, and site work, Redford Cavalry Barracks," not later than 12 noon on Wednesday, February 9th, addressed to the Director of Army Contracts, War Office, Whitehall, London, S.W. The Bills of Quantities should accompany tender in a separate sealed envelope, similarly addressed and marked "Bills of Quantities, Foundations and site work, Redford Cavalry Barracks," with the Contractor's name and address thereon.

The Secretary of State does not bind himself to accept the lowest or any tender.

(Signed) H. DE LA BERE,
Director of Army Contracts.

Richmond Perturbed.

The Richmond (Surrey) Town Council are perturbed, and not without reason, at a proposal to build large blocks of flats at the top of Richmond Hill, next to the Park Gates. The site is at present occupied by Ancaster House, an old creeper-covered Georgian mansion of some size, which has been in the market for a considerable time. A private firm proposes to demolish this dwelling—which, needless to say, consorts well with its surroundings and the amenities of this part of the district—and utilise the site. The site faces the famous "Star and Garter" Hotel, and the length of the popularly frequented terrace, and it is inevitable that the erection of high blocks of red brick flats would have a detrimental effect on the show part of the town, and would unfavourably impress visitors who came to see the famous view The preservation of the old-world surroundings and the view is a constant and anxious task for the Richmond Corporation, which is ever mindful that the prosperity of the place depends largely on its attractiveness as a residential quarter and as "London's playground." The fine legacy which our Georgian forefathers bequeathed to us is not one, therefore, to be lightly dissipated; and progress in the shape of brand new red brick structures is not one that commends itself to the Councillors as desirable in this particular quarter. Within the last ten years, as Alderman Thompson, ex-Mayor of Richmond and a well-known figure in town-planning circles, has stated, some £70,000 has been expended in preserving the view and amenities of Richmond, or an average of about £7,000 a year, and it appears that this sum will have to be increased by the further sum of £10,000, which is required to purchase the site. As the matter stands, plans for the proposed flats have been submitted to the Council, but not passed, and there for the present the matter remains.

The National Federation.

The annual general meeting of the National Federation of Building Trades Employers, which was held at the Trocadero Restaurant, Piccadilly Circus, London, last week, brought together a notable assemblage of the leading members of Britain's "greatest synthetic industry." It is pleasant to note the steady growth of this organisation in effective power and influence. The Federation stands for much more than a mere counter-movement to trade unionism. In that respect it is a model organisation, never abusing its undoubted power, while firmly and temperately resisting aggression. It respects and encourages the best elements of trade unionism, and in return is respected by trade unionists of the more reasonable type. Its attitude towards the workmen during a time of deep depression has been characterised by forbearance and sympathy amounting to magnanimity; for while, in some few instances, modifications of working rules became, in the prevailing circumstances, absolutely unavoidable, and have been in that sense accepted with a good grace by the workmen, no attempt has been made to take advantage of the situation. That in more prosperous times the men will remember this, and will be duly grateful, is perhaps too much to hope for; but the Federation is well prepared for contingencies, and has, indeed, set an example to the industrial world in its method of dealing with disputes by substituting peaceful arbitration for internecine and devastating warfare. Its Conciliation Boards have effected a complete revolution in the relations between employer and employed, mainly by the simple process of enabling the opposing parties to meet face to face and understand each other better, with the remarkable result that the building industry, which beyond all others was formerly notorious for strikes and lock-outs, is now entirely free from them. Peace having been thus effectually secured within its own dominions, the Federation has found opportunities for asserting its rights in other directions. Acting in the same moderate and conciliatory spirit which has proved so successful in what may be called its domestic policy, it is taking corporate action in opposing, for instance, the unfair conditions of contract which, in the powerlessness of individual or isolated firms to resist them, had become ordinary and commonplace; and it will be surprising if it does not eventually succeed in at least mitigating the equally iniquitous and absolutely ruinous practice of withholding for an unconscionable period, sometimes extending over several years, the payments due for work completed. It is most potent, however, in dealing, as a corporation, with corporate bodies. Its representations have been signally influential with municipalities: it is recognised and respected in Parliament; and professional bodies like the R.I.B.A. lend it an attentive ear. This honourable standing could not have been attained by dint of mere numerical force. It has been gained less by numbers than by weight. The plain fact is that the Federation is splendidly officered. Not only has it been remarkably fortunate in its successive presidents, but its Councils and Committees are rich in the possession of level-headed and diplomatic-minded men of affairs, whose tone and spirit, experience and wisdom, would do credit to any deliberative assembly whatsoever. During the past year, the best traditions of his office and of the Federation were ably sustained and emphasized by Mr Ernest J. Brown, and his successor in the presidency, Mr. S. Smethurst, of Oldham, is a gentleman whose career and character inspire the utmost confidence as to the immediate future of the Federation.

A Centenarian of the Cement Age.

It is recorded in a paragraph that is going the round of the newspapers, that the inventor of Portland cement is still among us. He is Mr. Isaac Charles Johnson, and, although he has just entered upon his one-hundredth year—which fact is the occasion of the newspaper notices—he is still hale and hearty, and until two years ago he was accustomed to ride a bicycle. He has lived to witness one of the most tremendous industrial developments that the world has known. Until about the middle of the nineteenth century, builders and constructional engineers were dependent on the "Roman cement" which, as had been rediscovered towards the close of eighteenth century, could be made by calcining and crushing the septaria or calcareous nodules found plentifully in London clay. This quick-setting cement soon began to give way before the more satisfactory material which was produced by compounding chalk or limestone and clay, and was called Portland cement from its supposed resemblance when gauged and set to Portland stone. Since the first factory for its production on a commercial scale was started near Northfleet, about 1848, the demand has become universal, both as to application and area, and in order to meet it with economy in the production and perfection of the product, the geologist, the chemist, and the mechanician have brought to bear on problems that, seemingly simple, are in reality of extreme complexity, the utmost knowledge, science, and skill, with the result that they have placed at the command of the builder and the constructional engineer a material that, while it has already become all-pervasive and indispensable, seems nevertheless to be on the eve of still further extensions of utility.

The Attitude of the Architect.

Plastic and tractable, strong and durable, and, in the form of reinforced concrete, taking kindly to a marriage of affinity with metals, Portland

cement seems to deserve, with respect to its adaptability to decorative treatment, more sympathetic attention than architects in this country have as yet been disposed to devote to it. In America the architect does not disdain to recognise that the material may possess artistic possibilities, but in Britain there sems to be an ill-advised tendency to leave concrete construction too much in the hands of the engineer, and to despair of architectural treatment. What is needed is abandonment of the mistaken view that reinforced concrete, being an artificial product, is more or less of a sham. The men who make this objection are often enthusiastic in their praise of "good honest brickwork," and are apt to extol the tiled roof for its artistic superiority over the roof that is slated. But is not slate a natural product, and are not bricks and tiles artificial-manufactured goods? Squeamishness with respect to concrete is therefore inconsistent. We are among those who believe that frank architectural treatment of reinforced concrete is both legitimate and possible; and we hope that the centenarian inventor of Portland cement will yet live long enough to see the material generally accepted in this sense by architects.

Cupboard Love.

The lay Press continues, intermittently, to give evidences that the lay mind is interesting itself in architecture. The latest witness to this unnatural manifestation is the "Spectator," which, in its current issue, has a well-written article on house-planning. This shows so much knowledge of the subject, and especially of the client, that it must have been written by an architect, and one, moreover, who is a lover of his craft, or how otherwise could he have declared that "the actual business of planning the house itself, and the situation of the rooms and passages, the approach to the house from the road, and the arrangement of the outbuildings, cottages, and stabling, and so on, can be a most alluring occupation"? And there is a distinctly professional touch in the observation that "it is true that those who are ignorant of the first principles of architecture will plan for themselves, or demand from their architect perfectly impossible combinations: passages without light, fireplaces without chimneys, and so on." This he must have learnt in suffering. His experience, not to say his suffering, in domestic work is further attested in the remark that "you cannot have too many cupboards in a house." It is only after long years of strenuous activity and keen observation that the architect succeeds in grasping this elusive but fundamental idea. How is it that the lady of the house has never by any chance happened to mention this simple requirement? We could have wished that the writer in the 'Spectator" had not put the idea into her head. Now we shall certainly never hear the last of it. "You cannot have too many cupboards in a house" will be quoted at us with maddening persistency, to the swift and complete exhaustion of all patience and of the world's already vanishing timber supply. Henceforward, sleeping and waking, the domestic architect will be unintermittently harassed and haunted by the horrent apparition of the venerable Mrs. Hubbard. The increase of the client's interest in planning is all very well so long as it promotes business; but if it is to mean that henceforth every house is to be a congeries of cupboards, why, farewell art and happiness!

THE ROYAL GOLD MEDALLIST, 1910.

At a meeting of the Royal Institute of British Architects on Monday evening last, it was announced that the Council had decided to recommend Mr. Thomas Graham Jackson, R.A., to the King, as the recipient this year of the Royal Gold Medal, given annually by His Majesty.

CARPENTERS' HALL LECTURES.

The Carpenters' Craft.

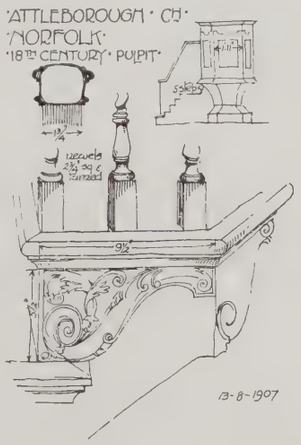
The third of the series of lectures was given at the Carpenters' Hall on Wednesday last, by Mr. Banister F. Fletcher. The lecturer said that the carpenter comes to us as an almost heroic figure out of the dim and dark ages, and wood has at all times been the natural material most serviceable to man. It has been used for structures of all kinds, bridges, posts for timber houses, roofs over tithe barns and churches, etc., scooped out and used as water conduits, and wrought by the mediæval artist into cunning devices. No definite record exists of the beginning of joinery as a distinct craft, but Shakespeare in "A Midsummer Night's Dream" makes Snug the joiner, and Quince the carpenter as different as any trades union of our day could make them. The carpenter's craft was at the beginning the pioneer craft, from which in later times sprang the carpenter and joiner.

Mr. Fletcher showed a wooden hut, the posts being the prototype of the Doric order, and from which sprang those marvellous marble buildings of Greece. We will endeavour to keep, he remarked, almost exclusively to work in this country, divided into internal and external work, and furniture. An early half-timbered cottage was shown, and the construction noted. This consisted of bent trees set in the ground and meeting at the apex of the gable, strengthened by braces. In these early homes there was no upper storey, and the space between the timbers was filled with wattle and daub. Anne Hathaway's cottage was instanced as a famous example of the carpenter's craft. A more elaborate example is Ockwells Manor in Berkshire, framed up of oak posts and rails with brick filling laid herring-bone pattern. Passing on to Cheshire, the lecturer pointed out the introduction of curved braces, and the contrast between the plaster filling and the black timbers, tarred to act as a preservative. Moreton Hall was shown with its coves under the windows divided into squares and crosses, and the lecturer drew attention to the genuine timber expression was given by exposing the pins.

The old American Colonial architecture of the early 18th century and onwards as in the house at Charlestown, Massachusetts, brings us to the architecture of Queen Anne. In their porticoes and entrance porches the Colonials made use of wooden columns of slighter proportions than stone, and so return to early custom. Not only in the country, but in our towns, may beautiful examples of the carpenter's craft be found. The Rectory at Winchester was shown, also a 15th century house in Belgium entirely faced with timber, and some old houses at Lisieux, with overhanging storeys, built thus, it is supposed, to protect the passers-by underneath, from the garbage which was thrown from the windows. London possesses a beautiful example of the craft dating from about 1600, namely, Staple Inn, Holborn, and shows how well this example, escaping the devastating fire has survived for 300 years.

Several slides of excellent examples of timber buildings were shown, including the front of Sir Paul Pindar's house, now in the Victoria and Albert Museum, the Feathers Inn at Ludlow, Ford's Hospital at Coventry, with its charming internal courtyard, and upright timbers quaintly fronted with small buttresses. From the consideration of these timber houses as a whole we pass on to consider certain features. Guildford Town Hall has a fine octagonal turret, a type expressive of the Georgian era, the clock, which is also a fine example of the craft, projecting so as to be seen from up and down the street.

Passing on to porches, the entrance to Moreton Old Hall, reached from a bridge over the moat, was, he said, suitable for an entrance to a nobleman's mansion, and a doorhead from Uxbridge was shown of a different type, later in date, the head supported by brackets and cherubs' heads beautifully carved. Having dealt with the timber houses of our forefathers, the lecturer continued, we may now pass to other forms of their art. Two market crosses were illustrated That at Ledbury, Mr. Fletcher said, fulfils its purpose with that directness which is always to be found in old work. It is constructed of oak posts resting on a masonry foundation. The windmill at Haarlem, Holland, like many of those in the low-lying districts of Norfolk and Suffolk, gives a contrast to the flatness of the surrounding country. A charming example of a modern timber bridge at Great Tangley Manor, by Mr. Philip Webb, and a pergola and tea house at Easton Lodge, by Mr. Peto, completed the illustrations of external work. Internal work was next dealt with, and an interior of Ockwells Manor House, Berkshire, showed the ceiling joists exposed, and panelled walls. In the 16th century the architect became ashamed, and covered up his joists with plaster, and so an insanitary space for mice, etc., was formed. Henry VIII's apartment at Hever Castle, Kent, showed the ceiling joists exposed and moulded, while some interiors of a house at Potter's Bar, designed by the lecturer, exhibited a pleasing example of modern craftsmanship.



The carpenter's craft, he said, provided the readiest means for protecting the interiors of houses from the elements. The roof over S. Sabine, at Rome, one of the earliest examples, has king-post trusses, and from this type the English carpenter evolved those marvellous roofs which have not been surpassed anywhere in the world. Some of the Norfolk hammerbeam roofs were shown, and the roof from Eltham Palace, Kent, while that at Westminster Hall was instanced as the most remarkable hammer-beam roof in existence, and with one exception, the largest wooden roof in the world; and as an unrivalled example of the carpenter's craft, emphasises the nobility of wood as a builder's material. After showing some examples of furniture, including a fine old oak settle, which could be used as a table, and a Jacobean table, Mr. Fletcher continued: Although I have ranged over a wide field, I have by no means covered the field of the carpenter's domain, and, in conclusion, I hope that those of you who are active craftsmen, will take away with you some pleasant recollections of the past, while you who are otherwise engaged, will do your best to encourage good solid craftsmanship and avoid meretricious ornament.

THE "ENDELLINE PHRASE" COMPETITION.

The result of the "Endelline Phrase" Competition promoted by Messrs. Thos. Parsons and Sons, of 8, Endell Street, London, W.C., the proprietors of "Endelline" Enamel, is announced as follows:—First prize, £30, awarded to Mr. Chas. Walter Stupart, 112, The Avenue, Bruce Grove, Tottenham, N.; second prize, £15, awarded to Mr. Thos. Robinson, 79, Rosegrove Lane, Burnley; third prize, £5, awarded to Miss B. Thompson, 35, Grand Parade, Cork.

"THE CRAFT OF THE CARPENTER"; SKETCHES BY BANISTER FLETCHER, F.R.I.B.A.,
ILLUSTRATING HIS LECTURE AT THE CARPENTERS' HALL LAST WEEK.

Proposed New Works.

ASHTON (LANCS.).—The District Council has approved the following plans:—J. and W. Rylance, Picture Palace, Bryn Street; James A. Baron, Theatre and lock-up shop, Heath Road; John Watson, ten houses, Princess Road; Greenall Whitley and Co., alterations, Queen's Head, Liverpool Road; Baptists' Trustees school, Bolton Road.

DANBURY (ESSEX).—A subscription list has been opened to provide funds for the erection of a village hall. About £206 has already been collected.

DERBY.—The Town Council are about to purchase from the Osmaston Estates Co. a site for a new elementary school. The site extends from Nightingale Road to Amber Street.

DUNFERMLINE.—The Town Council has agreed to feu 3½ acres of ground for the erection of dwelling-houses on the cottage system. The site is on land belonging to the Baigh, situated to the north-east of Townhill.

EXETER.—The L.G. Board has held an enquiry into the application of the City Council for a provisional order empowering the Council to put in force the Lands Clauses Act with reference to certain lands required for the improvement of Paul Street, Bartholomew Street (West), Well Street, and Blackboy Road.

HILL TOP.—The West Bromwich Education Committee are proposing to erect a new school here at a cost of £17,900. Messrs. Wood and Kendrick, architects, have prepared plans.

HORNSEY.—The following plans have been approved by the Borough Council:—Two dwelling-houses as maisonettes in Springfield Avenue, Muswell Hill, by Mr. Percy F. Crebbin, of No. 3, The Grove, Muswell Hill; six dwelling-houses in Lynmouth Road, Muswell Hill, by Mr. G. H. Paine, of Moorgate Street; fourteen dwelling-houses in Redston Road, Hornsey, by Mr. Harry East, of Redstone Road; alterations in and additions to "Denewood"; Broadlands Road, Highgate, by Mr. G. E. Nield, of 222, Strand; alterations in and additions at rear of high school for girls, Albany Road, Stroud Green; dwelling-house in Stormont Road, Highgate, by Messrs. Lander, Bedells, and Crompton, of John Street, W.C.; pavilion and skating rink in Stroud Green Road, Finsbury Park; three dwelling-houses on North Hill, Highgate, by Mr. H. E. Fedrick, of "South Lodge," North Hill; for conservatory and verandah at rear of No. 35, Cholmeley Park, Highgate, by Fedrick Brothers.

KNARESBOROUGH.—The U.D. Council have had plans approved by the L.G. Board for new offices, depot, etc. The scheme is to be put in hand at once.

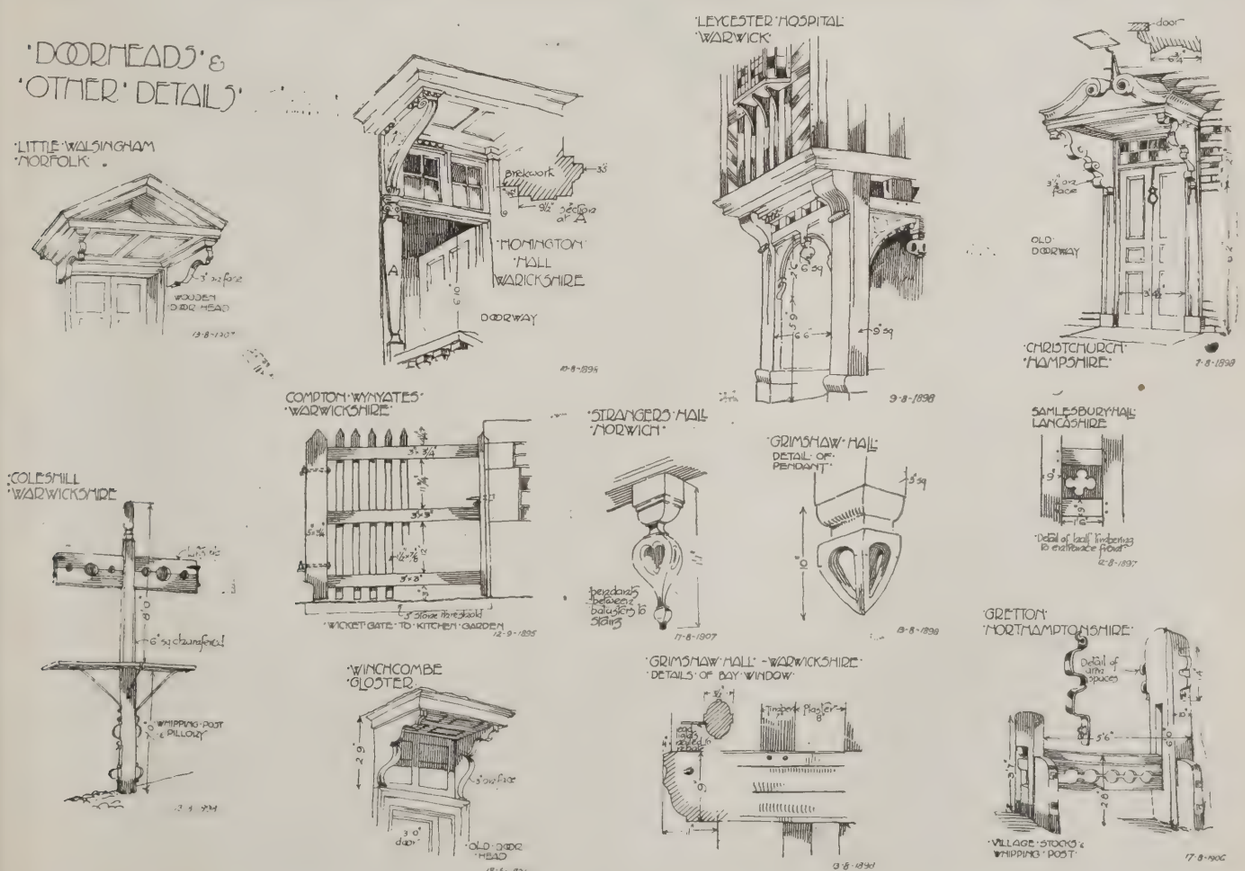
LLANDRINDOD WELLS.—The Council have instructed the surveyor to proceed forthwith in making the necessary alterations to the premises recently purchased for municipal buildings.

LLANRWST (N. WALES).—The U.D. Council has approved plans for the erection of slaughter-house and stable for Mr. Richard Roberts. Mr. D. Henry Roberts, Llanrwst, is the architect.

MONAGHAN.—The L.G. Board has held an enquiry into application of the R.D. Council to borrow £6,888 10s. for the erection of labourers' cottages.

ST. IVES.—The Town Council have a municipal building scheme in hand. A motion to ballot the ratepayers upon the scheme has been lost.

WINCHESTER.—The subscribers to a memorial to the late Rev. the Hon. Canon Alan Brodrick, Master of St. Cross, Winchester, have decided to erect a tablet in the Church of St. Cross Hospital, to extend St. Faith's Schools by the erection of an Alan Broderick class-room, and to extend the parish hall by adding a recreation-room.



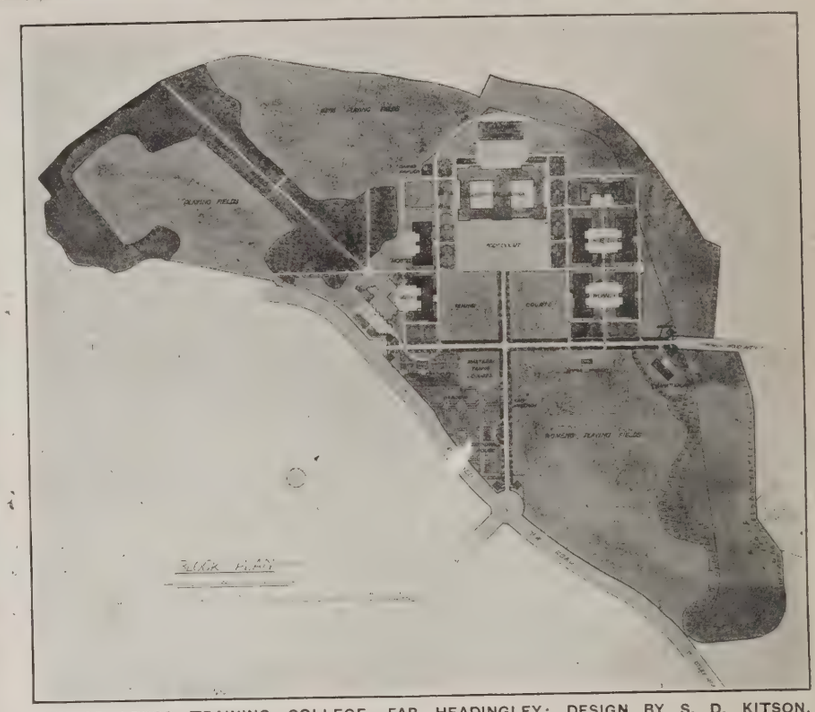
TOTTENHAM. The District Council has finally agreed to accept an offer from a firm of architects to purchase two and a-half acres of land forming part of an estate originally bought by the Council for workmen's dwellings. The land is required for a German woollen firm, who, it is stated, intend to erect a factory at which several hundred persons will be employed.

WAYLAND.—The Guardians have passed a resolution to appoint a Sites Committee to select a suitable site or sites for the erection of a new infirmary.

WELLINGTON (SHROPSHIRE).—The L.G. Board has held an enquiry into the application of the U.D. Council to borrow £2,500 for the erection of public baths. Plans have been prepared by Mr. G. Riley, the surveyor.

YORK.—Among the plans recently approved by the Corporation are the following:—Fulford Conservative Club, outbuilding, Fulford Road; York Central Mission, amended plan of Mission Hall, Swinegate; house, Norfolk Street; four houses, St. Olave's Road, approved; temporary additions, Clarence Street; alterations, Plumber's Arms, Skeldergate; motor garage, Haxby Road Works; twelve houses, Jamison Street, Albemarle Road; two houses, St. Clement's Grove. The Race Committee's plan for new stands was also approved, subject to the owners undertaking, at their own cost, to test one bay of the stands with a load of 2 cwts. per foot super.

The A.A. Play 1910 Committee are inviting designs for a poster illustrating this year's play. A prize of one guinea will be awarded to the author of the selected design.



"THE CRAFT OF THE CARPENTER": SKETCHES BY BANISTER FLETCHER, F.R.I.B.A. ILLUSTRATING HIS LECTURE AT THE CARPENTER'S HALL.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Feb. 8	POSTER FOR THE A.A. PLAY, 1910. The Committee invite designs for a poster illustrating this year's play. A prize of one guinea will be given to the author of the selected design. Full particulars may be obtained from Mr. Percy Lovell, 23, Old Queen Street, Westminster, S.W., to whom designs must be sent in by first post on date named. A jury of three will assess.
Mar. 1.	GLAZED BRICKWORK DESIGNS AND ESSAYS. A committee of glazed brick manufacturers invite designs for works to be executed in glazed brickwork, also essays as to the advantages to be derived from the use of this material in accordance with conditions to be obtained from J. Johnston Green, 142, Liverpool Road South, Southport. Premiums of 100 guineas, 50 guineas and 25 guineas awarded to designs and essays jointly. Assessor Mr. Max Clarke, F.R.I.B.A., appointed by the President, R.I.B.A.
Mar. 31.	SHEFFIELD ENDCLIFFE PARK CHURCH. Plans desired for Church for 650, Institute for 150, Primary Department for 125, Junior Department for 95, and Caretaker's Apartments. Premium, not merged in commission, £35. Assessor, Chas. Hadfield, Esq., F.R.I.B.A. Questions until February 10. Delivery on March 31. On receipt of 5s. the Secretary, J. W. Nicholls, 64, Everton Road, Brocco Bank, Sheffield, will furnish conditions and instructions, with plan of site, showing existing buildings, levels and drainage—these not returnable. Deposit returned only to those who send plans.
May 31.	MUNICIPAL OFFICES, KARACHI. The Municipality offer a premium of 7,500 rupees (£500) for the best design, detailed plans and estimates for new Municipal Offices. Cost not to exceed 500,000 rupees, and the style of architecture is left open to the designers. Ferrotype plans of the site and a general arrangement of the floors of the building showing the accommodation to be provided, together with a copy of instructions to architects, will be supplied to intending competitors on application to the Chief Officer and Chief Engineer, Karachi Municipality. A charge of Rs. 5 will be made therefor, which will not be refunded. Each set of drawings must be sent in anonymously, but accompanied by a sealed envelope containing the author's name and address. Each set of drawings and all the documents required, including the sealed envelope, must be securely packed in a wooden box addressed as follows:—The Chief Officer and Chief Engineer, Karachi Municipality, Karachi, India, and forwarded, at the competitor's own risk and charges, in time to reach the Chief Officer on or before the 31st day of May, 1910. It is proposed to apply to Government for permission for one of the chief architects to act as assessor to decide on the design to which the prize shall be awarded. The decision of the assessor will be final and not be open to dispute. The decision of the Municipality will be made within three months of the latest date for submission of designs, and payment of one-half of the premium will be made thereafter to the author of the selected design, the balance to be paid when the further details specified in the instructions to architects have been supplied. On payment of the premium the Municipality will have all rights in the design, with power to erect the building under its own agency, either according to the design selected or with such additions or alterations as it may deem necessary.
No Date.	SECONDARY SCHOOL AT PETERBOROUGH for Soke of Peterborough Education Authority to accommodate 250 scholars, but allowing for enlargement so as to accommodate 300 scholars. Particulars of the general instructions and conditions, together with a plan of the site, may be obtained on application to Walter J. Deacon, Clerk to the Authority, Cross Street, Pte

CITY OF LEEDS TRAINING COLLEGE, FAR HEADINGLEY: DESIGN BY S. D. KITSON, M.A., ARCHITECT.

Societies' Reports.

R.I.B.A.

A list of the prize and studentship awards was given on January 19th. The following announcements are additional:—

TRAVELLING STUDENTS' WORK.

Godwin Bursary 1908.

The Council have approved the report of Mr. Arthur Halcrow Verstage, who was awarded the Godwin Bursary in 1908, and who reported on the "Galerie des Machines" of the Paris Exhibition of 1889.

Owen Jones Student 1908.

The Council have approved the work of Mr. A. E. Martin, who was awarded the Studentship in 1908, and travelled in France and Italy.

Soane Medallist 1908.

The Council have approved the drawings executed by Mr. George Drysdale, who was awarded the Medallion in 1908, and travelled in France and Italy.

Tite Prizeman 1908.

The Council have approved the work of Mr. George Drysdale, who was awarded the Tite Prize in 1908, and who travelled in Italy.

Pugin Student 1909.

The Council have approved the drawings executed by Mr. Sydney H. Miller, who was awarded the Studentship in 1909, and travelled in Lincoln, Cambridgeshire, and South West Scotland.

Saxon Snell Prizeman 1908.

The Council have approved the report submitted by Mr. William Milburn, jun., who was awarded the Saxon Snell Prize in 1908, and who reported on the Hospitals in Germany.

Birmingham Clerks of Works and Builders' Foremen's Association.

The second lecture of the present sessional series was delivered to the members of the above association by Mr. Holland W. Hobbis, A.R.I.B.A., who took for his subject, "Design and Craft in Building."

By means of a number of lantern slides, he pointed out how buildings erected in earlier ages show that the designers were also the craftsmen, and that though there may have been a master mind who arranged the original plan, the details were evidently the work of various craftsmen, all of whom were thorough masters of their craft, understanding the characteristics and limitations of their materials, and working with the desire to produce the greatest amount of strength and durability in their buildings, and at the same time to make them beautiful.

The lecturer showed how, though there still remained a good constructional foundation in the building trade of the present day, yet the application of building material was often at fault, the technique which is so evident and so much admired in old examples being absent.

The lecturer expressed a hope that by educating our artizans in the principles of art, and training them to understand and appreciate what is beautiful in form, colour, and design, we may obtain a race of craftsmen whose work will be as worthy of admiration and study as those of a previous age.

THE DEMOLITION OF OLD PROPERTY.

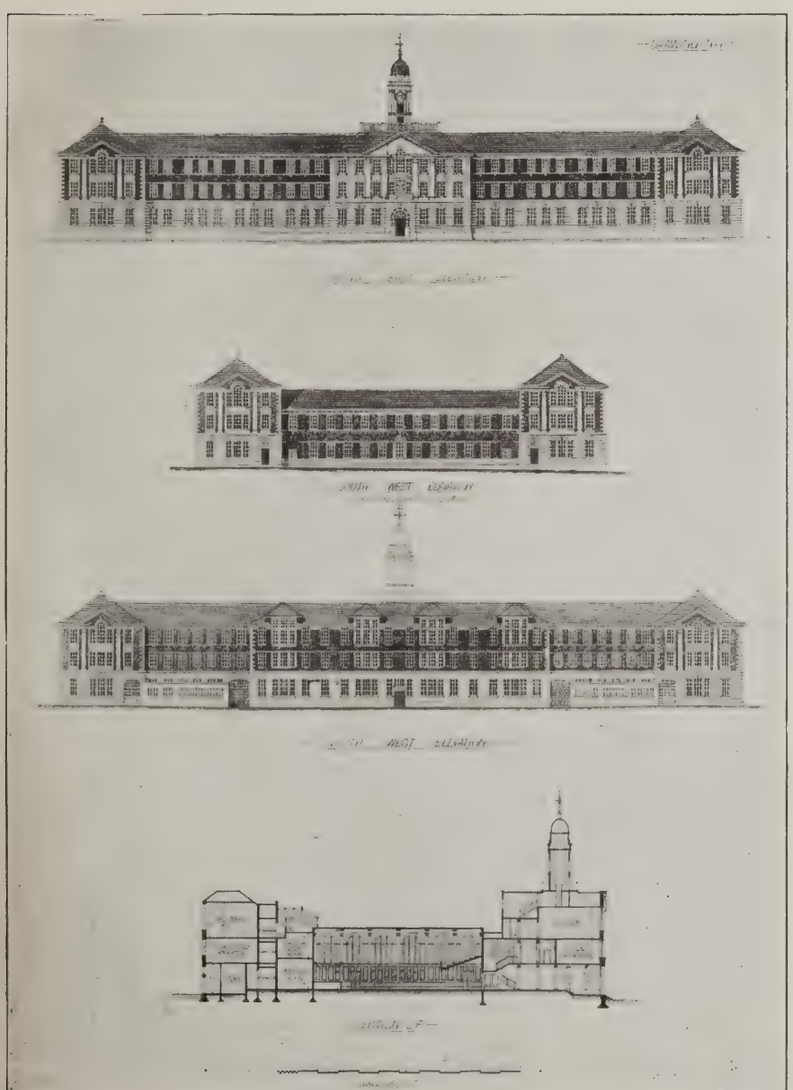
A rather important decision of some interest to architects has been given recently in the North. A five storey city warehouse with basement was sold for demolition by auction to a firm of house breakers, who at the completion, it was stated, left behind them three or four hundred loads of rubbish in the basement. The architect commissioned to carry out the new building, but who was no party to the above transaction, received instructions to allow in his quantities for excavating from the level of the existing basement floor.

The proprietors now sought to recover the amount it cost them to take out and remove the debris. The general conditions of sale issued by the auctioneer covered the selling of the building in lots floor by floor, or in toto, which latter was actually done, and a clause in the conditions of sale stated that the purchasers must clear away the rubbish from the floors of each storey as they worked down to them. Each floor, including the basement floor, was detailed in the catalogue as a lot. It appeared from the evidence that the general interpretation of this clause was, in the case of separate purchasers, to make arrangements with each other to form holes through each floor and

shoot the rubbish into the basement, "or any other convenient place on the site."

The judge held that it was only necessary to remove the rubbish from the floors, and that it was not obligatory to remove the rubbish from the site to comply with the conditions of sale. The fact that the basement was sold as a floor seems to have been entirely overlooked, otherwise one wonders by what subtle process did the man who bought this floor escape from the obligation binding him to have it cleared as he worked down to it. Can it be held that he can remove everything of value from this floor first and then allow the dumping to commence from above? Obviously the decision lends itself to this interpretation. Further, in the absence of a basement, or on a restricted area of building surrounded by streets, where would the convenient place be for tipping rubbish?

This action has served to disclose the unsatisafctory views which seem to be too commonly held on this subject, and the judge's decision has only gone to confirm them.



Evidence was given that the rubbish could have been removed during the process of demolition for a mere fractional amount of what it cost the proprietors later. It therefore seems clear that in these transactions the client would be well advised to consider whether some more advantageous arrangement could not be made, so that the cost of removing the rubbish shall not be disproportionate to the amount obtained from the sale of the building.

The conditions may or may not have been badly worded in so far as the rubbish was not stated to be removed actually from the site, but one thing is certain, the rubbish was never intended by the proprietors or the auctioneers to be left. No one requiring buildings demolished expects everything of value to be removed and the rubbish left on his hands—perhaps the only thing which is removed at a loss. It is certainly a very convenient interpretation for house breakers, but it is surprising that such a custom should have become established.

Therefore, to all whom it may concern we would suggest they would be well advised in the future to see that the nature and extent of the house breakers' work is stated clearly, and in words which admit of no ambiguity.

Apart altogether from any question of litigation, such as the subject of these remarks, it is very doubtful whether it is in the proprietor's interest to sell old property by auction. The auctioneer is not the most likely person to take into consideration what is, after all, the object in view—the clearing of the ground for a new structure. There is a very limited market for old buildings, and very often the contract changes hands several times at much larger prices than that at which it was knocked down to the original purchaser. The process of demolition is also very slow, as everything of value is carefully sorted out and stacked until a suitable purchaser comes along. As the old buildings are demolished, it is often necessary to shore up adjacent dangerous buildings until such time as the new structure is built up to relieve the danger. As far as possible the shoring ought to be arranged so as to interfere as little as possible with the internal arrangements of the building. Therefore the builder with his plans before him is certainly the proper person to be entrusted with this work. On supposition and by inference one can see very grave issues and complications which might easily arise where the work is not entrusted to the builder. Should an accident happen through faulty shoring, the builder naturally accepts no responsibility, while the other party, not being directly responsible, might be able to escape liability.

We would suggest, when buildings have to be demolished, it is far better that they should be included in the builder's contract for the new structure. The question of cost is one on which opinions may differ, but all things taken into consideration the client stands to gain in the end, and he has the full knowledge that responsibility is reduced to a minimum.

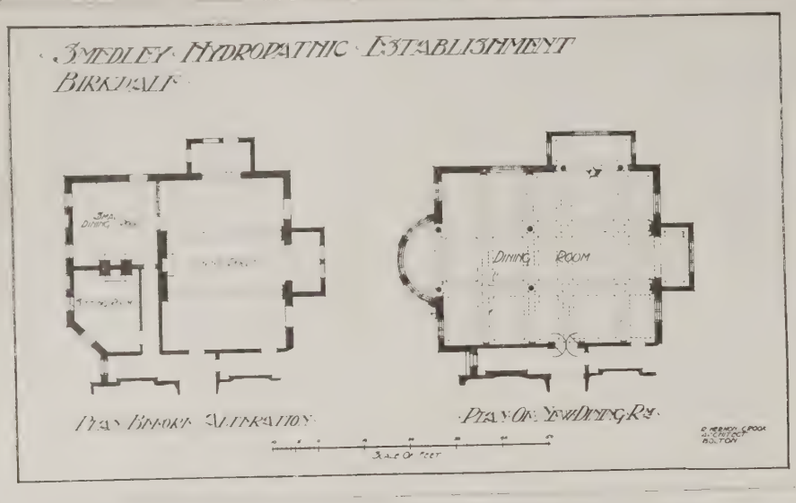
Correspondence.

[*The Editor declines responsibility for the statements made or opinions expressed by correspondents.*]

A Remedy for the Financial Loss to Architects Caused by Competitions.



To the Editor of THE BUILDERS' JOURNAL.

SIR,—It has recently occurred to me that the profession does not realise the enormous waste of time and money which is due to competitions, and as the "Regulations for Architectural Competitions" are now under consideration by the Institute, I take the opportunity to draw attention to the financial loss, with the hope that some means may be found to minimise it.

Take a typical case of £10,000 competition for a limited number of ten, the average out-of-pocket expenses would be at least £20 each, or a total of £200, the average value of the designs, say, £100 each, or a total of £1,000. That is, the competitors pay £200 in expenses or give £1,000 value of designs for one of them to receive instructions to carry out the work with a commission of £500. If the competitors be 25 in number, then they pay as much in expenses, £500, as is the commission.

Take a £10,000 unlimited competition, the number of competitors is almost certain to be 50, when the expenses at £20 each would be £1,000, and the competitors pay twice as much in out-of-pocket expenses as is received by the successful architect, and prepare designs worth £5,000, or half the value of the building to be erected. If there be 100 competitors, which is not unusual, then they pay in expenses £2,000, one fifth of the value of the building, and prepare designs worth £10,000, the full value of it.

The competition for the London County Hall was a most severe tax on the profession. The design which I prepared cost £320 in out-of-pocket expenses, allowing nothing for my own services and much time given to it. I am told that other designs cost double that sum. But take the £320 as an average, then the 199 competitors paid £63,680, which is £20,180 more than the 5 per cent. commission on the £850,000 proposed expenditure on the building. If each competitor had put £320

into a sweepstake, Mr. Ralph Knott might have drawn a prize of £63,680 instead of a commission of £43,500, and would have had no further work and responsibility; and the other 198 competitors would have saved all their time and thought in the preparation of useless designs, the value of which cannot be put at less than £1,000 each, or £198,000.

I notice considerable difference in the comparative affluence of members of other professions, and of architects, and incidentally in their social position, and I attribute this to the unproductive labour and expenses of competitions. I doubt if there is any other profession or trade which does so much without remuneration, except perhaps the medical profession, and they have the satisfaction of doing good to their fellow men, and are not called upon to pay the hospital expenses. We brighten our wits and give the younger men a chance by competitions, but the promoters are the supposed gainers; so long as we offer so much for so little, they naturally accept it. I think, however, that we should have the sympathy and help of promoters in any proposals to minimise the loss to the profession, if the regulations were reasonable ones, issued with the authority of the Institute, and as loyally supported by the profession, as is the recognised scale of commission.

The remedy I have to suggest is that a scale of the approximate value of payments for out-of-pocket expenses should be adopted by the Institute (ranging from, say, £1 per cent. for a £1,000 building to one shilling per cent. for a £850,000 building), payable by promoters of all competitions, and made part of the contract between promoters and competitors, and that members of the Institute should be required not to compete unless such contract were entered into by the promoters.

I would apply this scale to the three classes of competitions named under Clause 5 of the "Regulations for Architectural Competitions" as follows:—

(a) By advertisement and unlimited, half the scale to each competitor sending in bona-fide design and complete drawings.

(b) By advertisement and limited by selection, the full scale.

(c) By personal invitation and limited, the full scale plus a specified sum for the design.

The sums payable by the promoters would be very small in proportion to the value of the designs obtained by them. For a £1,000 building there could be obtained five designs for 5 per cent. extra to the usual commission; for a £10,000 building, say, at four shillings per cent., there could be obtained 25 designs for an extra 5 per cent., or ten designs for an extra 2 per cent; and the London County Council could have had their 199 designs for £42,188, practically an extra 5 per cent., a large sum for them to pay, but over £20,000 less than what the competitors probably did actually pay for out-of-pocket expenses.

The obligation to pay on such a scale would no doubt deter the promoters from indulging so frequently, readily, and often unnecessarily in the luxury of a competition; it would also tend to limit and to reduce the number of competitors.

The payments made by the promoters of each competition would be little, and due by them, but the aggregate increased annual income to the profession would be very substantial and due to them.

Incidentally the limitation would cause more careful selection of competitors and improve the chances of those selected.

It has been suggested to me that these proposals might not commend themselves to promoters. But if supported by a regulation of the Institute, many promoters would accept the scale as a matter of course, and if any did not do so, members of the Institute could then without offence decline to compete. At present I find I cannot decline without liability to give offence to some good friend or other who has brought my name to the notice of the promoters, and consequently sometimes I do compete under conditions which I feel to be humiliating. The Institute, by improving its regulations, is at the least helping us to help ourselves.

I am taking the unusual course of writing a similar letter to the editors of each of the professional papers, and have to ask for your indulgence for doing so, as I wish the whole profession to have the opportunity of considering my suggestions before the meeting of the Institute on the 7th of February, when the "Regulations for Architectural Competitions" are to be considered.

Yours faithfully,

EDWARD M. GIBBS.

Sheffield.

NEW DINING ROOM AT SMEDLEY HYDRO, BIRKDALE. R. HERMON CROOK, ARCHITECT.

This room has recently been completed, having been made out of several smaller rooms on the ground floor of a four-storey building, as will be seen from the plan. The scheme of decoration is ivory white throughout, with light oak furniture and rose crimson carpet, the electric fittings being in brass. The general contractor was Mr. W. H. Foster of Southport. The fibrous plaster work was carried out by Mr. J. W. Hindshaw of Manchester, from which city Messrs. Edward Wood supplied and erected the steelwork. Electric and gas fittings were supplied by Messrs. Spital and Clark of Birmingham. Messrs. George Wragge supplied the glazing, and Messrs. Warings the carpet. The architect was Mr. R. Hermon Crook of Bolton.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional, or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The Editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned, but enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies, or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s. made payable to Technical Journals, Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable; and it must be understood that both question and reply will, as a rule, be published in these columns

Surveyors Under the Finance Act.

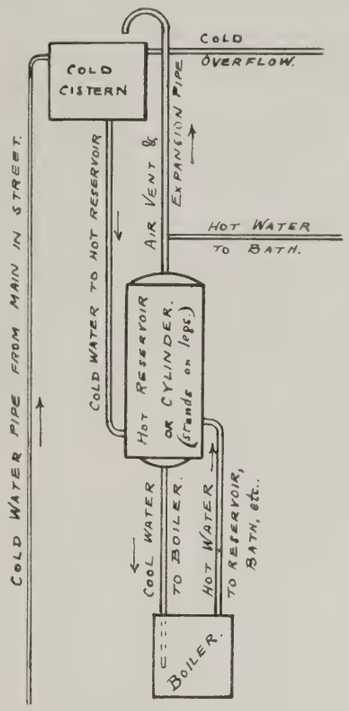
H. P. J. (ANGLESEY) writes: "(1) To whom should one apply for the post of surveyor and valuer of land, which will be necessary under this new Budget, should same come into force? (2) Are there any list of the duties required published?"

—Your letter contains two questions which we find it difficult to answer in a satisfactory manner. Were we desirous of obtaining this information we should apply to the Surveyors' Institution, and possibly to H.M. Office of Works, and H.M. Civil Service Commissioners (Burlington Gardens, W.)—the former institution (12, Great George Street, S.W.) would be in a position to obtain the information, and if you are a member would, we have no doubt, take steps to find out for you. We think that application to the last-mentioned should bring the information required, however.

B. AND B.

Articles of Apprenticeship.

W. W. B. (BOLTON) writes: "In the case of a pupil who has served by arrangement in an architect's office for a period of five years, but for whom no articles were drawn up at the time, what is the usual procedure for putting same in order? Is there any recognised legal form? and will you please inform me what is usual in above circumstances to put the matter in order? I may say the principal is willing for any arrangement, and that the date of commencement of services was April, 1904."



—What we understand from your letter is that, having now served for five years, you wish to have something in the nature of "retrospective" articles drawn up as between you and your employer. We have not heard of any similar case, nor do we quite see why it should be necessary to do so. There is as far as we know no legal necessity for articles at all in the case of the architectural profession, though there is in the case of those professions where registration is in force. The R.I.B.A. do not appear to attach so great significance to the matter of articles as to that of education in some recognised school, or the passing of their examinations. We should say that all that is necessary is that the employer should give a certificate of the period of pupilage and a testimonial to the effect that this period has been passed by the pupil entirely to his satisfaction.

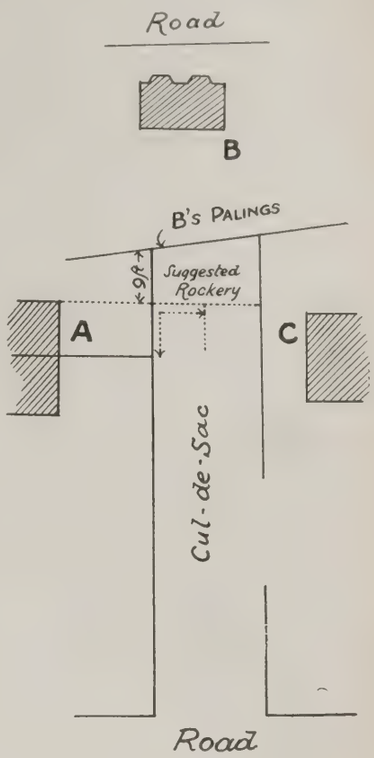
B. AND B.

Domestic Hot-water Apparatus.

H. C. (MUSWELL HILL) writes:—"After drawing all hot water possible from the tap in the bathroom, there appears to be still about one-quarter (at the top) of the hot-water tank, still containing hot water which cannot be drawn off. A plumber informs me that the flow pipe from the boiler in the kitchener must not be taken higher than two-thirds of the way up the tank. Is this so, and must this hot water still in the top of the tank remain and thus be wasted?"

—If the hot-water pipe from the boiler be connected to the top of the hot tank, this is no reservoir of hot water, which simply skims across the top every time a hot tap is opened. This sketch shows the best relative

Illustrating reply to H. C. (Muswell Hill).



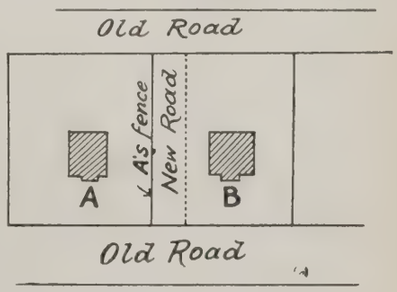
position of the four pipes needed by each hot-water reservoir. All the space above the inlet of hot water from the boiler is then reservoir of hot-water; and if a hot tap be left running, all the hot water will be drawn off, and its place taken by cold or tepid water, for no kitchen range boiler is an instantaneous water-heater. I have not been able to lay out the run of pipes from your description of the results of their working, and incline to think that a choked pipe allows hot water to gradually accumulate, and makes too much resistance towards the tap to allow it to run out as long as the tap can draw water from elsewhere.

INGENIOR.

Liability for Road Paving.

"BRICKS AND MORTAR" (ASHTON-ON-MERSEY) writes:—A is the owner of house marked A on enclosed sketch plan, and has received notice from the local authority that they intend to take over the road under the Private Streets Act, 1892. 1st. Is there any need for A to make the road beyond the line of his gable, as shown by dotted line? 2nd. If the road is taken past A's house-top to the boundary fence belonging to B, will B be charged as a frontager for the full width of the road? The surveyor says yes; is this so? In that case, of course, B would have a way out which, as a back door, might be objectionable at A's front. 3rd. If to prevent the latter A and C. plant a plantation and rockery at the end of the road, is the district surveyor justified in charging A not only the frontage of his house but also an added frontage equal to half way across the road (and, of course, C likewise)?"

—The liability of an owner under the Private Street Works Act, 1892, depends *prima facie* on his frontage; but by virtue of S.10, the urban authority may, if they think just, resolve that in settling the apportionment regard shall be had to (a) the greater or less degree of benefit to be derived by any premises from such works; and (b) the amount and value of any work already done by the owners or occupiers of any such premises. They may also include premises which do not "adjoin" or "abut" on the



Illustrating first reply to "Bricks & Mortar" (Ashton-on-Mersey).

street, if access to such premises can be obtained from the street, and it will be benefitted thereby. Having regard to this section, A's liability will, of course, be limited to his frontage, whatever that is. It will be the frontage of his property, not of his house. With regard to the question whether he is to be liable is to be settled by the highway authority, it is clear that if a rockery is planted, this would extend A's frontage and make him liable for the repair of the rest of the road.

B.

"BRICKS AND MORTAR" (ASHTON-ON-MERSEY) writes: "Since writing you over road liability another question has arisen on another matter. A. and B each owned houses as indicated on sketch plan enclosed. B pulled his house down and sold, and he cut a road through the land as shown by dotted line right up to the fence, which I believe belongs to A. B has since sold the land to builders, and they have built property facing same. When the Council take over the road will A be charged as a frontager to have to pay half

Illustrating second reply to "Bricks & Mortar" (Ashton-on-Mersey).

the cost? This seems unfair, as the road and property is really detrimental to him."

—This is a purely hypothetical question, and not very easy to answer. It seems, however, that if the local authority take over the street as suggested, there will be nothing to prevent their making an apportionment on A. All his rights under the Act will be open to him. It is unlikely that the authority will take over the road unless it is put into good order by the owner of the building estate.

B.

Hot Air Heater.

H. N. E. (HIGHGATE) writes: "Could you tell me of a good hot-air heater for a room, and if that is a good mode of heating? The idea is to put a hot-air boiler at level of fire and run a fresh air inlet to an outlet from it to the room and back of fire, and so heat same. Is it possible, and would it cost much?"

—All methods of heating heat the air, from which you may conclude it is a good mode of heating. The essential point is that the heating surface be so arranged and placed that it can be easily cleaned. The air pipe from outside should be straight; but if a bend be unavoidable, a manhole or some inspection opening should be made at the bend, so that the air-pipe can be easily cleaned thoroughly in all parts. This cleaning may be needed on the hot-pipe in the chimney once a week or once a quarter, and on the cold-pipe once a month or once a season, according to the smokiness of the district and the dustiness of the place from which the air is drawn. A 4in. cast-iron hot-water pipe may be large enough for your room. To heat the air properly a certain length of journey over the heating surface is needed by the air. A wind of 1½ miles an hour allows the air it blows for a 5ft. plumb journey over fireclay 4ins. thick and sheet iron at the back of a good fire to become 30 degrees C. warmer than when it went in; an 8-mile wind only allows the air to become 10 degrees C. warmer at the most. If cast-iron be used next the coals, "burnt air" will be made, but cast iron in the chimney, where no flame can play on it, will give satisfactory results for a long time. With iron ¼in. or 5-16ths in. thick on pipes 3in. or 4in. bore, one 3in. pipe in a 3in. by 3in. flue, with a 6ft. journey, will warm up to 1,600 cubic ft. of space, and 2 pipes 3in. bore or one 4in. bore in a 3in. by 14in. flue, with an 8ft. journey, will warm up to 2,500 cubic ft. of room. These proportions are more or less, according to the windows, aspect, and other conditions of the room and house.

INGENIOR.

Colouring Concrete Floor.

A. P. (HECKMONDWIKE) writes: "Do you know of any stain that would colour a concrete floor brick-red? The floor has been laid four months. It was mixed with vermilion colour, but this has gradually faded away."

—We do not know of any stain which would permanently colour a concrete floor. Such floors are mostly impervious to water, and any application of colour would not penetrate deeply. The floor could only be coloured on the surface, and if it is desired to secure a permanent colour this could only be effected by hacking off the surface of the old concrete, washing it and thoroughly wetting it, and then applying a new surface coat of cement mortar coloured with red oxide of iron. If pure vermilion was used we could well understand the colour fading, but even with permanent red oxide of iron used with concrete the colour often fades, though perhaps not to any considerable extent. If a very deep colour is required it will be necessary to mix practically pure cement and colour together, namely, one of red oxide of iron, and one of Portland cement.

Calculations in Column Design.

STRUCTURAL (STREATHAM) writes:—"I should be obliged if you would give the calculations necessary in designing a column and bracket to support a crane girder. This subject does not appear to be treated in many text books."

—The column can be calculated for as follows:—

First find the central load, which is equivalent to the eccentric load of 12 tons.

This is given by the formula $W_1 = W\left(1+\frac{x d}{k^2}\right)$

Where x = eccentricity of load in inches,
d^c = distance from centre to extreme edge of section in inches,
k = radius of gyration of section in inches about the axis at right angles to the plane of the paper.

As a trial let us take a 10″ × 6″ × 42lb I beam with one 12″ × ½″ plate riveted at each end.

From the Dorman Long Handbook we see that for this section, Area = 24·35 sq. in. k = 4·72″, d^c = 5·5. Least k = 2·62. Then x = 9 + 5·5 = 14·5.

∴ Equivalent central load $= 12\left(1+\frac{14\cdot5\times5\cdot5}{4\cdot72^2}\right)$

= 57·08 tons.

∴ Total central load = 5 + 57·08 tons = 62·08 tons.

There is some difference of opinion as to how to consider the fixing of the ends in this case; we will take the stanchions as 14ft. long and fixed at one end and free at the other. This may err a little on the safe side.

The buckling factor $= c = \frac{2\times14\times12}{2\cdot62} = 128\cdot5$

∴ Adopting Rankine's formula in the form

$$f_p = \frac{6}{1+\frac{c^2}{6000}}$$ we have

$$f_p = \frac{6}{1+\frac{128\cdot5^2}{6000}} = \frac{6}{3\cdot75} = 1\cdot6$$ tons per sq. in.

∴ Safe central load = 1·6 × 24·35 = 39 tons about.

This section is not quite strong enough.

Next try a section composed of a 10″ × 6″ × 42lb I beam with two 12″ × ½″ plates riveted at each end.

For this section, A = 36·35 sq. in. d = 6″. k = 508″. Least k = 2·92″. ∴ x = 15″.

∴ Equivalent central load $= 12\left(1+\frac{6\times15}{5\cdot08^2}\right)$

= 53·88 tons.

∴ Total central load = 58·88 tons.

$c = \frac{2\times14\times12}{2\cdot92} = 115.$ ∴ $f_{p1} = \frac{6}{1+\frac{115^2}{6000}}$

= 1·87 tons per sq. in.

∴ Safe load = 36·35 × 1·87 = 67·9 tons. This section will do well. The question of the buckling of the web of the bracket is one on which we have practically no simple formula to go upon, and we do not know of any experimental results.

Fig. 1.

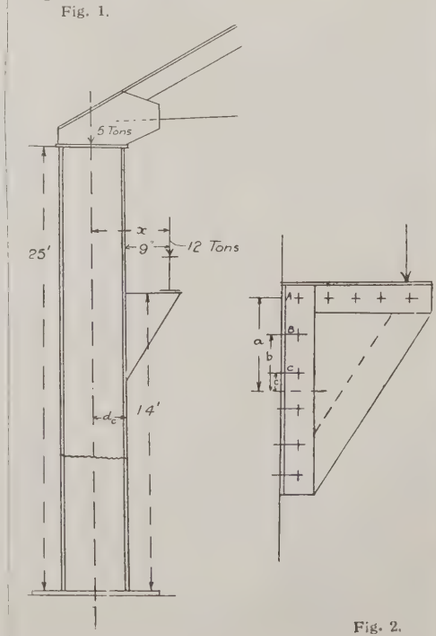


Fig. 2.

Illustrating reply to "Structural" (Streatham).

One rough method which should certainly err on the safe side is to take a length from the end of the bracket equal to ⅛ to ¼ of its length, and to assume the bracket to be an open one, the resolved part of the weight being taken as acting down the inclined portion (shown dotted in Fig. 2), considered as a strut.

Some further information on this point is required.

The tensile stress in the rivets A, B, C (Fig. 2), could be found as follows:—Let a, b, c be their distances from the centre, and A, B, C the loads on the rivets.

Then $C = \frac{Ac}{a}$, $B = \frac{Ab}{a}$ (because stresses are proportional to distance from neutral axis).

Further Aa + Bb + Cc = Moment of Tension component of Moment of Resistance.

= ½ Bending Moment $= \frac{12\times9}{2} = 54$ in. tons in our case.

As an example, take a = 7·5″, b = 4·5″, c = 1·5″.

∴ $C = \frac{A}{5}$, $B = \frac{3A}{5}$.

∴ $A\times7\cdot5 + \frac{3A}{5}\cdot4\cdot5 + \frac{A}{5}1\cdot5 = 54$

∴ 10·5A = 54 ∴ $A = \frac{54}{10\cdot5} = 5\cdot14$ tons.

This is, of course, divided over two rivets, one for each angle.

A.

Exterminating Beetles—Further Answer to "Reader," Hull.

In answer to your querist, if he will freely sprinkle some powdered borax about the crevices from which the beetles are known to come, they will in a very short time disappear from his premises. This is my own experience and that of others who have used the recipe, which, although it is so simple, like the washing in Jordan despised by friend Naaman, your correspondent would find it, as he did, "an absolute cure." Ants and earwigs may also be got rid of by the same treatment.

E.P.M.

Does Hot Water Damage Cement?

J. W. (NOTTINGHAM), writes: "A few years ago I put in a warehouse a large cement wash-up place, formed of 6ins. of good cement concrete and coated on the top with 1½ins. of cement and granite chippings in equal proportions. The work was well done, but has been a constant source of trouble through frequent leakages. My own impression is that the trouble arises from the fact that during the day there is a large glue boiling apparatus and tea boiler with considerable heat and frequent flows of hot water, while at night the whole naturally cools down, thus giving rise to slight contraction and expansion."

—As regards the leakage of concrete due to changes of temperature, in the circumstances cited we think that the fact of the temperature of the concrete and subsequently cooling being raised by a considerable amount, accounts for the leakage. Cracks will develop with only ordinary changes of temperature in concrete surfaces, and very much more considerable trouble has resulted in situations where the concrete is raised by artificial means to high temperature on one side, while the other side is cool, and the conditions cited by our correspondent in which the floor cools down at night no doubt would aggravate the evil. Concrete seems to be about the best material to use in the circumstances, but it must be reinforced against temperature stresses, and the reinforcement would have to be considerable in amount. The best form in which to introduce it would be in a meshwork of rods, wires, or one of the sheet metal reinforcements on the market. In order to ascertain the amount of the reinforcement it would be necessary to know the variations in temperature. It appears as though 1 per cent. of reinforcement would have to be introduced both longitudinally and transversely in the slab.

CONCRETE AND STEEL SECTION
(MONTHLY.)

On Cement Manufacture. At a meeting of the Junior Institution of Engineers on December 15th, 1909, a paper was read by Mr. Harry Horsburgh on "The Design and Running of Modern Cement Works." This was an interesting paper, but it dealt with the manufacture in detail, a subject which has often been referred to in our columns. In the discussion, however, some interesting points were raised, particularly by Mr. D. B. Butler, who referred to the fact that until recently foreign firms seemed to have a monopoly in respect to the manufacture of cement machinery, and the design of cement manufacturing plant, but he held out some hope that the reproach that British firms could not compete in this field was likely to be removed, as a British firm of good repute had at last taken up this most important branch. It is, indeed, remarkable how many industries have been advanced abroad when the pioneer inventions were made in this country. Portland cement is but one instance of a chemical process invented in this country, the manufacture of which has been perfected abroad. The development in cement works construction seems to be advancing on two lines. The Schneider Kiln, which was introduced some years ago to cheapen the cost of production, had a severe setback when the rotatory process of cement making achieved success. But now improvements have been introduced whereby the Schneider kiln can be operated continuously, so that as the chemical action is exactly the same, by proper attention to the burning, as good a cement can be produced by the one process as by the other. There is considerable difference of opinion at the present time among advocates of these two kilns as to which are the cheapest to operate, it being claimed upon the one hand that the rotatory kiln produces the more uniform quality of clinker, and is more economical in operation, while the advocates of the continuously operated Schneider kiln think that the cost of upkeep and repairs is much less than in the other process, while the quality of the clinker is simply a question of care in the burning, and it is claimed that rotatory kilns are not so profitable unless a mill contains several of them, so as to allow for some being stopped by break-downs and for repairs. The consumer, however, is not so much interested in the matter at present, but buys his cement in the cheapest market, and at the present time cement is very cheap, so much so that it seems difficult for firms to make a substantial profit. The cost of fitting up a complete cement factory is large, and the return on the capital outlay is small.

Mr. William Gilbert, M.I.C.E., in the discussion at the Junior Institution of Engineers, also referred to another important matter, the type of store for cement. He pointed out that formerly brick walls were mostly used, but that the lateral pressure of the cement induced a bending moment in the walls, which brickwork was not well adapted to withstand unless heavily reinforced by tie-rods. Consequently, a type of store had been introduced in which a kind of culvert was formed in the ground leading to a passage discharging automatically into a passageway below, like as a hopper. In this case a considerable portion of the cement was against the ground, which resisted the pressure. Now, however, with the advent of reinforced concrete, silos are being built to serve as cement stores. Mr. Butler referred to some which were circular and 40ft. in diameter, and held 1,500 tons of cement each. These silos had conical hopper bottoms, so that they would empty themselves completely, thus doing away with all manual labour, and he cited that a saving of 3d. per ton was effected in this way. Reinforced concrete is a material particularly adapted to the construction of silos for containing materials of all kinds, and cement is not at all a difficult material to deal with. In the United States reinforced concrete stores are built for grain, seed, ore, and cement, while the many water-tanks that are being constructed of the material, are, in a practical sense, silos for the holding of water. As regards the economy effected by automatic hoppers for cement, however, there seems to be more than a little doubt, because both the author of the paper and Mr. G. B. Maxted, in the discussion, thought that perhaps the best store, from all points of view, was simply a shed to protect the cement against the weather. It is much cheaper in first cost, and it was thought that the return on the capital outlay involved in the building of stores and in the automatic packing and loading appliances was not justified by the result of the saving in operating. The cost of shovelling the cement by a gang of men was hard to beat for economy.

Water Tanks. The design of elevated water tanks is by no means so simple as it appears. A number of tanks that have been constructed of the material have shown signs of leakage, and, in a few cases, the leakage has been very considerable, so as to render the tank partly useless or extremely wasteful. In a square tank the pressure of the water induces bending moments, and this causes deflection. At the same time the floor and cover of the tank are deflecting in another direction, and these deflections are also increased possibly by temperature changes, and the net result is that series of complicated internal stresses are set up which results more often than not in cracks, which may or may not be serious. The most approved form of tank seems to be the circular one, in which the pressure of the water, being the same in all directions, and pressing uniformly on all sides, only induces tension in the sustaining members and does not put anw direct bending moment into the construction. There are, however, other difficulties which complicate the problem, because we find that the walls being stressed, must expand, whereas the stresses on the cover and bottom of the tank tend to cause them to contract. This necessitates various precautions being taken in the design, and provision must be made for temperature stresses. These latter, to a great extent, have been ignored by designers in the past, but their great importance has been realised, though in most water-tanks they are not perhaps of so great moment as in some other structures. The cracks in water tanks that are sometimes described to this cause are more often due to complicated internal stresses produced by the deflections inducting contraction and expansion at various parts, tending, as it were, to tear one part from the other. However, success has been obtained in the building of reinforced water towers, and it only requires a close analysis of the problem to obtain equally good results in the future. The problem, as we have said, is not so easy as it may appear at first sight, and the design of such structures should be given into the hands of those who are specialists in such matters, and are prepared to guarantee the efficiency of their constructions.

Responsibility for Public Buildings. Fire-risks at the Royal Albert Hall were under discussion at a recent meeting of the London County Council, when Mr. Stuart Sankey asked the chairman of the Theatres and Music Halls Committee what was being done in the matter of the Albert Hall. It had been referred to that Committee some time ago to report upon the steps taken for the protection of the public from fire when entertainments were being held in that building. In reply, Mr. H. J. Greenwood, the chairman of the Committee, said that the Chief Officer of the Fire Brigade had been instructed to report upon the arrangements, but the secretary of the Albert Hall had declined to afford facilities, on the ground that the hall did not come within the Council's jurisdiction. The Committee was endeavouring to ascertain whether the premises were used for the perforamance of stage plays, and whether action could be taken on that ground. That the enquiry should have been necessary, and that the answer to it should have been so unsatisfactory, is surely a curious reflection on the casual methods of public bodies. The London County Council does not seem to know its position in the matter; and if that is the case with respect to the Albert Hall, the uncertainty may very possibly apply to other buildings that, while certainly within the Council's area, are very doubtfully within its jurisdiction. The sooner these recondite mysteries are cleared up, the sooner will the public feel assured that all necessary steps have been taken to ensure the utmost immunity from fire dangers. Who is responsible for the safeguarding of the Albert Hall? This surely ought not to remain a moot point, and the London County Council should take prompt steps to ascertain quite definitely its responsibilities with respect to this and any other buildings about which there is the least doubt.

Reinforced Concrete Chimneys. On Thursday, January 20th, that young and enterprising society, the Concrete Institute, discussed in lively fashion the question of "Reinforced Concrete Chimney Construction." The paper was read by Mr. E. R. Mathews, and the discussion was carried on by various members who had had very varied experience in the building and in the use of such chimneys. According to the experience of some, no cracks appear on the outside of the shaft, but serious ones develope on the inside. According to others, hair-cracks only can be found on the inside, but those on the outside are 1-16th in. and more wide. The antagonism between the champions of "wet" and "dry" mixing is sturdily maintained. The beliefs concerning the effects of heat are not so decidedly and sharply contrary, because they appear to be all vague and hesitating. The appreciation of the mathematics of reinforced concrete stresses is on the wane, but there still exist those who have faith in, and apply, some portions of these mathematics.

Taking these items in the reverse order, let us in the first place express emphatically our horror of the scrambulous screeds of half-yard-long algebraic formulas, which cover so many pages of the books and pamphlets issued upon reinforced concrete work. May our readers rest assured in the peaceful conviction that these amazing dialectics have no other use than that of frightening customers into the mistaken belief that they cannot use reinforced concrete successfully without them. Such formulæ have no relation with reason, and still less with experience. It should be understood that it is improper to apply mathematics to any branch of engineering before that stage is reached in which we have a fair knowledge of the physical facts. This stage has hardly been reached in the use of reinforced concrete, especially as exposed to high temperatures. The more complex the physical stresses, so long as we have no full experimental knowledge of them, the more simple ought to be the mathematics applied to their

practical calculation, and the more freely should the roughly approximate character of the calculations be acknowledged. From the point of view of rational expression of real physical knowledge, nothing could exceed in extravagant absurdity the long and complicated formulas, which are at present put forward.

Next, as regard the effects of heat. Throughout the above interesting discussion, attention seemed to be wholly concentrated on expansions and contractions following variations of temperature, and on differences of temperature-expansion co-efficients of steel and concrete. We would suggest that the effects of heat are two-fold; firstly, those of drying and baking, and, secondly, those of temporary change of dimensions. The former is evidently the more important, and the accompanying contractions and distortions continue over very prolonged periods. Open air drying at atmospheric temperature is quite as much a heat effect as a baking at high temperatures; and the considerable accumulation of experience over many years of such low-temperature setting, ought to be the guide in newer investigations of the behaviour of the material when exposed to flue and furnace heats. The condition of good setting under low temperature is well known to be quietude, that is, absence of violent alternating changes of condition, whether of heat or of other kinds. Any frequent alteration of extreme conditions cannot but lead to disintegration. If the process of baking to a condition suitable to resist deleterious effects of furnace and chimney temperatures be required to be hurried up, it appears to be essential to exercise extreme and unremitting care to avoid any rapid change of temperature or other external condition during the process.

As to the stresses arising under load, which stresses the reinforced concrete expert heroically perists in calling "strains" (although the use of the word strain in this sense has been banished entirely many ages ago from all scientific engineering phraseology) one of the eccentricities of the normal calculations is the violently impossible "supposition" that all the tensions are taken by the steel while no tension comes on the concrete. When the writer once pointed out the physical impossibility of this, so long as the steel and concrete were well bonded together, the reply of the expert was to the effect that the hair-cracks in the concrete prevented it transmitting any pull. Thus it appears that in order to obey the behests of the experts the concrete must crack itself in innumerable sections! It might be within the limits of reason to "suppose" that the pulls exerted by the concrete are negligible in amount so far as regards their effectiveness in withstanding external loads, although this is not the actual fact within the easily attainable limits of accuracy in calculation; but as regards the safety of the concrete itself against fracture, nothing is more certain than that, if the two be efficiently bonded, the steel and concrete are stretched in the same geometrical ratio and that therefore they are stressed in proportion to their respective moduli of tensive elasticity. The steel must not be stressed more than corresponds to a strains in both, which involves in the concrete a stress safe for that material. Otherwise the concrete will be fractured. If it be fractured, of what use is it? Why not do without it altogether? It is such silly theory as this that is embodied (with frequent algebraic mistakes) in terrifying, if not imposing, pages of theory in the text-books, etc. It ought to be a matter of British pride that all this claptrap is an importation from abroad.

It having been experimentally demonstrated that alternations of temperature reaching as high as 800 degrees or 900 degrees F. act destructively by a disintegrating process upon reinforced concrete, the theorists console themselves by "supposing" that chimney temperatures do not exceed 500 degrees or 600 degrees F. Why not "suppose" the actual act that they seldom fall below this limit, and frequently very greatly exceed it; and, basing upon this reasonable supposition, apply themselves to discovering a quality of reinforced concrete that will not be harmed by exposure to alternations of temperature between 60 degrees and 120 degrees F.?

We will conclude with a suggestion deduced from observation of the history of the use of combinations of steel and concrete in the building of houses. It appears probable that the only satisfactory solution of the chimney problem is to build a properly braced and riveted skeleton chimney in steel bars, and then to fill this in with concrete of such dimensions and of such quality as will ensure that the concrete will in its straining yield to and be governed by the steel framing. If such a structure be possible under the heat conditions, and if it be well designed for its specific duties, it will have many advantages, among which will be less area of surface exposure to wind pressures, superior elasticity in the inevitable swaying under wind pressure, less weight to impose upon its foundation, facility in designing for weight stability (which will depend chiefly upon the amount of concrete), independently of strength (which will depend chiefly upon the steel frame), and great facility in spreading the base (without material increase of wind pressure moment), so as to suit any specified character of the available foundation.

LEGISLATIVE BUILDINGS, SASKATCHEWAN, CANADA.

The Office of Works for the Province of Saskatchewan are busily engaged in completing the details involved in the construction of a new block of Parliament Buildings, at a cost of about £300,000 and some particulars in connection therewith may be of interest. The building, as will be seen from the photograph, is four stories in height, 700ft. long by 70ft. wide, and one of its features is a dome 185ft. in height by 50ft. in diameter. It is of skeleton type, and is constructed throughout in reinforced concrete, Kahn reinforcement being used: the facades are faced with ornamental stone panels. The value of the reinforced concrete work was £60,000, and the contractors, Messrs. P. Lyall and Sons, were congratulated upon the speed of construction. Their work was started in April, 1909, and completed by November, 1909. The American method of construction was followed, and the following illustration shows the towers and elevators lifting the concrete in tubs, which in turn were emptied into two wheeled barrows holding a third of a yard cube. A test was made last month upon one of the beams, having a span of 27ft. and with a load of 40 tons, the deflection was only ⅛ of 1in., which finally went back to 1-16th of 1in. after the test load was removed. The designs were prepared by the Trussed Concrete Steel Co., and the construction supervised by Mr. A. Wilson.

RAPID AND EASY DIAGRAM OF MAXIMUM STRESSES: FAILURE BY SHEAR, PLASTIC AND ELASTIC.

By Professor Robert H. Smith.

(Concluded.)

Again, the commonest notion of perfect elasticity is the maintenance of constant linear proportion between stress and strain, the modulus or ratio being called E. But every one who has made engineering tests of material knows that if a bar is pulled out a little beyond the yield point and then relieved of the pull, its recoil will be represented by a straight line on the diagram, as in Fig. 5, and that, if load be again applied, it will go up again along this same straight

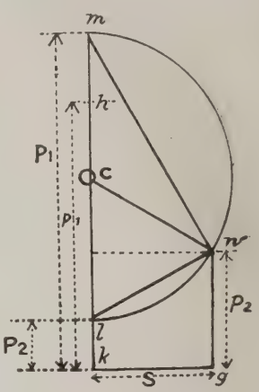

Fig. 4.—Professor Smith has detected a slight error in this figure as given in our issue for January 5th: the diagram, amended, is here repeated.

line. It has been strained beyond the elastic limit, and yet it is still "perfectly elastic." It has attained to a new "perfect elasticity," which is, indeed, more "perfect" than the last, because the new yield point is now considerably higher than the old one. Moreover, it has very commonly now a higher modulus, E, the new straight line being steeper than the previous one. Surely these results are anomalous according to the orthodox theory of elasticity. With most of our materials this process can be repeated many times, each repetition raising the yield point, and often raising the modulus E. We are all familiar with many other ways of raising both E and the yield point, all depending upon some mode of "overstraining."

Thermal Elastic Conditions.

Again, compare this "solid" modulus E with those we invariably use for gases. The one is for linear strain and the other is for bulk strain, but this is not the contrast to

LEGISLATIVE BUILDINGS, SASKATCHEWAN, CANADA: VIEW OF ONE OF THE FLOORS.

General view.

Detail view of centre portion, showing towers for elevating material.

LEGISLATIVE BUILDINGS, SASKATCHEWAN, CANADA.

be now referred to: there is a "Bulk Modulus B" for elastic solids which can easily be calculated in terms of E and η. But the gas elastic modulus entirely depends upon the thermal conditions of expansion: there are an "isothermal," and an "adiabatic," and an "isodynamic" modulus, and, in fact, as many moduli as there may be different expansion curves determined by the infinitely variable surrounding thermal conditions. Yet in the elastic theory of solids no account whatever is taken of the thermal conditions regulating heating or cooling during the process of straining. Everyone knows that if a piece of metal is much strained quickly it becomes heated, while if the straining is so slow as to give opportunity for the dissipation of the heat, it may remain uniformly at atmospheric temperature. Is it not irrational to expect to find the same solid modulus E under such different conditions? The heat generated by the straining of solids has never been measured in any set of published experiments. Not even any proposal to measure it has been publicly made.

It may be instructive to compare solids with fluids in this respect. Heat is developed in both solids and gases during compression, and during expansion from the compressed condition heat is lost by both. In both mechanical work is done by external bodies upon the body being compressed, and during release from compression the body does work upon external bodies. In a gas, so long as it remains gas, and is not frozen to the solid state, no tension is possible; but in solids heat is generated by extension, and given out again during recovery from the extension. Whether solid or liquid or gas, heat is generated by forcible departure from the unstrained condition, i.e., when external mechanical work is done on the strained material. There is here no contrast between the thermodynamic laws of solids and fluids. Thus the contrast in their behaviour arises solely from the absence of rigidity, that is, absence of possibility of shear stress in the one case, and its presence in the other. It might be objected that in fluids we have necessarily three *equal* principal stresses, while in solids these principal stresses may be unequal. But this means exactly the same thing as above: there is no shear stress because the principal stresses are equal. When the principal stresses are unequal there is necessarily shear stress.

Viscosity and Plasticity.

Intermediate between gases and solids we have viscous liquids. Here we have viscous resistance to *differences of velocity of flow*, and the co-efficient of viscosity corresponds in certain respects to the modulus G of shear elasticity. The contrast between the two is that the viscous modulus refers to differences of *velocity*; while G refers to differences of *position*. In other words, the former takes into account the *time* element, while the latter does not. All theoretical and practical calculations about viscous flow are based upon *time-rates*. In ordinary elastic theory time-rates count for nothing.

Now there exists no sharp line of demarcation between viscous fluids and plastic solids. Clay and mud belong to the one or the other class, according to the percentage of water in them. The theoretical demarcation between the two lies in the definition of a viscous fluid as one in which a shear stress of however small amount will produce fluid flow. But there are some clays and muds and soft metals which quite certainly belong to this class of viscous liquids, but which would require twenty years of careful watching and exact measurement to enable us to detect the flow. Therefore, it is probably correct to say that there is actually no practical distinction except one of degree between viscous fluids and plastic solids.

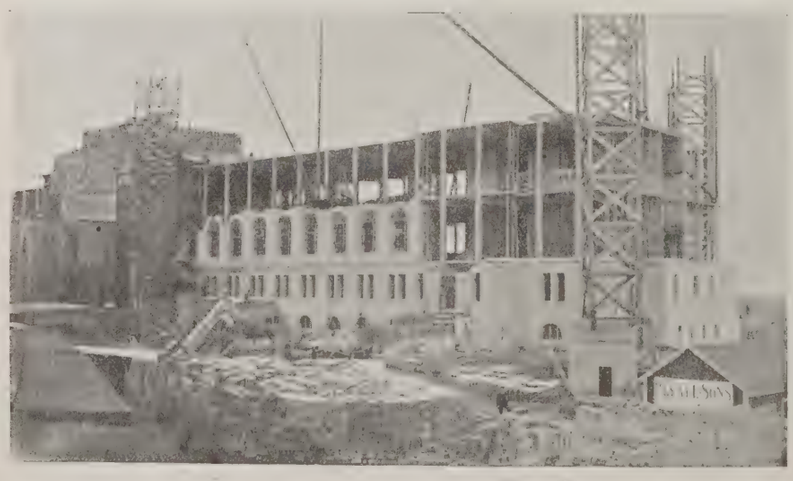
Again, nearly all our engineering materials, except glass and hard cast iron, have various small and large degrees of plasticity under sufficient stress.

Detail view of floor test. Load 40 tons.

LEGISLATIVE BUILDINGS, SASKATCHEWAN, CANADA.

Limit Constituting Failure.

Now the important debate that is attracting just now the serious attention of scientific engineers is as to *failure* under shear and other stresses. The limit constituting failure is variously defined. Sometimes the "yield point" is taken, sometimes the "elastic limit," sometimes total fracture, to determine failure. Those who insist most strongly on distinction between yield point and elastic limit are also most careful to avoid explaining what they mean by elastic limit; and we have shown above that the yield point of each specimen may be low or high, according to the past history of the treatment of the piece. In every case it is quite clear that the "failure" dealt with occurs in a condition in which the plastic qualities of the material have already begun to play an important part, and in which its elastic qualities no longer govern the result.



The Time Element Essential.

This being so, the present writer maintains that no really scientific solution of this problem is possible without taking into account the *time-element*, and also the thermal conditions. Unfortunately the thermodynamics of solids have been completely neglected by the writers of thermodynamic treatises. No completely satisfactory theory of the failure and safety of ordinary constructional engineering materials can ever be framed without basing it on the rational thermodynamics of semi-elastic, semi-plastic substance. It is no part of our proposal to attempt this task in this article. It would need a long and learned treatise to do so successfully, and before this could be written much further experimental work is required. Our object is limited to the demonstration that this subject cannot be fully understood without applying to it the consideration of *time rates*.

'Past History" of Materials.

There is no practical man who has had much to do with the skilled use of metals, who will not freely admit that the quality of any piece of metal depends largely upon its "*past history*." What is history? It is the succession in *time* of past events.

The ordinary patterns of testing machine, and the ordinary methods of test, are altogether unsuited to render visible the time-effects of stress. Since extensive specification-tests have become the fashion, it has been commercially necessary to reduce to the lowest limit the cost of testing each sample.

View showing building of masonry walls.

LEGISLATIVE BUILDINGS, SASKATCHEWAN, CANADA.

Since the testing machine used is expensive, and the personnel of the testing-room must be high-class, it becomes necessary to spend the minimum of time over each test. Even in the college-laboratory there are so many students who have the right to the opportunity of making tests that each test must not occupy much time.

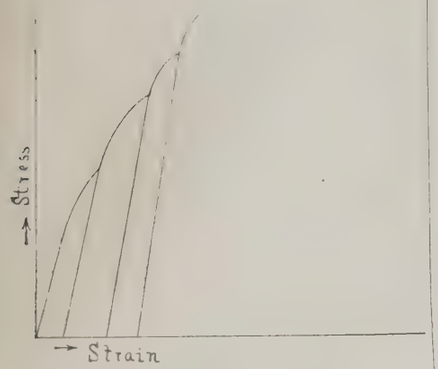


Fig. 5.

The Time Rate in Tests.

The "rule" which governs the "time-rate" in the ordinary test is to "set the pump going, and to keep the lever floating." This produces an entirely artificial time-rate of increase of strain, and increase of load which depends mostly upon the speed and capacity of the pump, the "give" of its connections with the ram and its barrel, and the leakage at the various joints, and to a less but still quite arbitrary, extent upon the section and quality of the test specimen.

The present writer was for several years in charge of a small, slow-working testing-machine in which the straining was operated by a screw and worm gearing, the speed being under control, and in which the load was measured by a set of powerful springs, there being no need to keep any lever floating in order to obtain a continuous true reading of the load. The tests were necessarily tedious, but they gave a surprising amount of generally unknown information upon the time-effects. For extremely small stresses, no doubt there is a definite constant ratio between stress and strain, and on total removal of the stress there is a total disappearance of the strain. But if the straining be very slow the limit beyond which the strain does not wholly disappear when the specimen is relieved of load, is very low; and moreover, this strain disappears quite slowly. Again, under any considerable stress, but far below the "yield point" as revealed by the ordinary testing machines, the ratio of stress to strain depends upon the time-rate of straining; if this ratio be called E, then E is less with slower straining. Moreover, the full strain develops slowly. The stress-strain curve starts up a straight line, and soon deviates from this in the direction of greater proportion of strain to stress; but *the initial straight line is steeper the greater the speed of straining*, and the curving away from the straight line is gradual, and does not indicate any sudden definite yield point, such as is indicated by the sudden break in the diagram taken from any ordinary lever-testing machine worked at the ordinary high speed.

An Instructive Experiment.

One instructive form of experiment which shows the time-effect very clearly, is to run up to a considerable stress, and then leave the test-piece under load for a long time. In a rough way this experiment is often made with a lever machine; in a very short time the lever falls on its lower stop, and, unless the weight is rolled back on the lever, so as to reduce the load and keep the lever floating, no further record is obtainable. With the above-mentioned machine, the apparatus could be left alone for 24 hours, or for several days (in some cases it was left over a whole

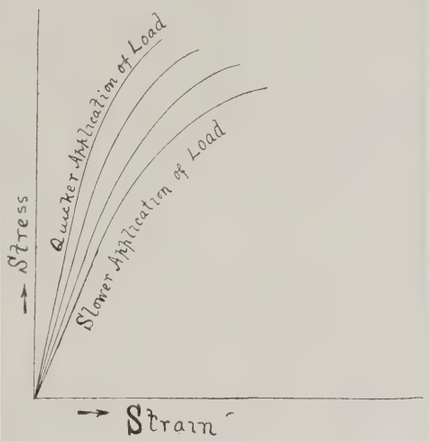

Fig. 6.

week, in order to complete the observation) with the loading automatically maintained—not at the first sustained load, but at a gradually decreasing load as the stretching progressed in time.

The character of these results is shown in Figs. 6 and 7. In these the strain differences between the curves is exaggerated, in order to make them easily visible on small scale diagrams.

The Outcome of these Observations

is to show very clearly that in all forms of rolled iron and steel, and probably in all metals used in engineering, except hard cast iron and glass, the total strain under any but extremely light loads is the sum of two parts; one which develops very quickly in linear proportion to the increasing load, and a second which takes considerable time to develop its full amount.

A fact that few would expect beforehand is that most timbers exhibit the same kinds of time-effects as do these metals. No testing machine, and no process of actual construction or building, ever puts the full load on *instantaneously*. We can, therefore, never have the opportunity of finding out whether the first part of the strain follows *instantaneously* the increase of the load. If it does, it would probably be fully entitled to the description of a "perfectly elastic" strain. The present writer cannot conceive of any experimental method by which this question could be definitely settled. Heavy loads can be applied with great suddenness both by impact, and by explosion in enclosed vessels; and it is easily conceivable that with sufficient refinement of strain-measuring apparatus the momentary strains accompanying such sudden application of load could be ascertained without very large error. But all such applications of load are inevitably accompanied by *dynamic effects*, which completely alter the distribution of stress and strain from that postulated in the theory of *static* elasticity.

Time Stretching.

In the experiments indicated in Fig. 7, the continued time-stretching of the specimens involved shortening of the springs whereby the load was applied and, therefore, time-decrease of load.

In each case represented, the curve stops short at a definite point, showing a final equilibrium between the lessening load and the increasing strain, an equilibrium not disturbed by any prolongation, however great, of the application of the load.

But if the first load be above a certain limit this equilibrium is never reached. The plastic strain increases at first very slowly; then still more slowly; then, after the time has reached a certain limit, at an increasing time-rate, which eventually becomes rapid and leads to total failure, either by fracture, or by excessive permanent elongation. The higher the first load, the sooner will be reached the turning point from slow primitive stretching to rapid final stretching.

Fig. 8 exhibits, essentially the same phenomenon under another form of experimental procedure. Here the series of curves correspond to successively higher loads applied so that there is no drop in the load before the end of the curve is reached. In these diagrams the vertical ordinate is strain, and the horizontal *time*. Prof. Perry has suggested that these curves have mathematically a logarithmic form, and has compared them to the leakage curves through an electric insulator. In each curve the load is increased at a moderate rate, until plastic strain is evidenced, after

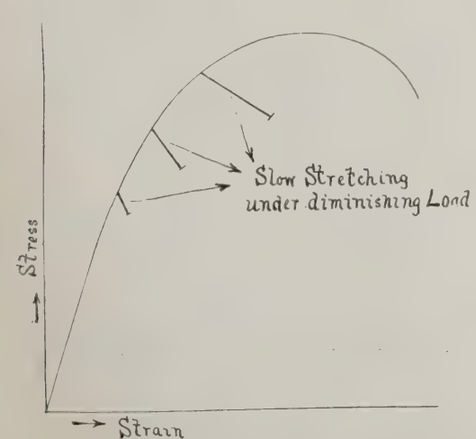

Fig. 7.

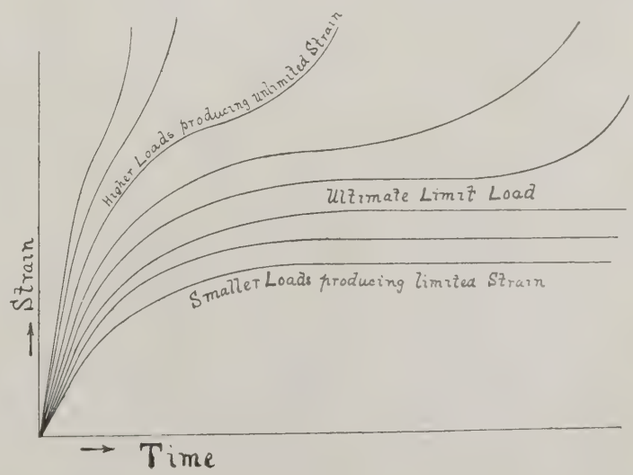

Fig. 8.

which the load is kept constant (wherein the conditions differ from those of Fig. 6). Under this constant load the strain increases at a time-rate which gradually slows down until it reaches zero, beyond which the remainder of the curve is a horizontal straight line, no further increase of strain occurring. This horizontal line lies higher for each greater load. The reason of this slowing down of the progress of plastic straining and its eventual stoppage is that the *time-effect* of the long-continued stress (possibly really the re-arrangement of molecular structure under plastic straining) is the gradual *hardening* of the material: its further plasticity is eliminated. But at a certain limit of load, after continuing along the horizontal line for some considerable time, *which may be several weeks or even months*, the diagram again begins to move upwards in a curve that becomes steeper and steeper as time elapses, until it eventually ends in complete failure by fracture. With still higher load the diagram has a shorter length of horizontal line (shorter time); it turns up at an earlier date. But no load which shows at any period this upturning, fails to lead to ultimate failure if the material be homogeneous. The writer has observed a few cases in which there has occurred a second stoppage of increase of strain; but he has always thought that this indicates want of homogeneity. This occurs frequently in tests of timber. With still higher loads the horizontal part disappears entirely, leaving a curious S-shaped curve. As the load applied is made higher and higher, this S-shaped curve becomes flatter, until eventually it straightens out into an approximately straight line, the line becoming steeper with further increase of load.

The limit between the load which gives the highest horizontal line which *never* turns up and the lowest load which eventually results in such up-turning, is clearly a limit of immense physical importance as regards this class of material. It is to be desired that numerous experiments should be made to discover this limit for various qualities of our different structural materials. Below that limit the material is of practical use, although it may be unsuitable (so loaded) for very many purposes. Above it the material can be of no structural use.

Elastic-Plastic Solids and Viscous Fluid.

The phenomenon of this limit is also of great physical interest as showing the difference between an elastic-plastic solid and a viscous fluid. With a viscous fluid there is no such limiting strain, however small the load. For viscous fluids, according to the common belief of physicists, the time-strain diagram is always a straight line without limit, the slope of the line being proportional to the load or stress, which is here a simple shear stress. The greatest load for a solid which yields a horizontal straight line that never turns up, may be taken as a measure of the distance in point of quality from the condition of fluidity; that is, a measure of the solidity as contrasted with fluidity. In the viscous fluid no shear stress can ever exist which is not determined by a *time-rate*: in a solid there still remains static and permanent shear stress independent of time, after all its plasticity has been exhausted and eliminated.

The initial part of this limiting diagram for a solid is evidently largely influenced by the elastic quality. The latter part is chiefly determined by the plastic quality of the test-piece; that is by the break down of its *Rigidity*. The Rigidity, as is well known, depends upon shear stress and strain; in fact, the modulus of shear elasticity G is generally called by scientists the Modulus of Rigidity.

The flow of a viscous fluid does not necessarily result in rupture of any part of the fluid; it does so only when the cross-sectional variation of velocity is so great as to produce eddies or spraying. A close examination of the physical reasons why it does not so, and comparison with those why excessive shear strain in solids does result in rupture, may lead to an understanding of the conditions under which solids fail by shear and those under which they fail by tension or compression. The writer's idea is that under certain limits of ratio of normal strain to shear strain the failure is by shear, and that beyond these limits the failure is by normal stress; and that this limiting ratio depends in some way upon the *degree of solidity* defined as above suggested. But so far this opinion is speculation unconfirmed by direct experimental evidence. Very probably also there is no abrupt passage from the one to the other condition.

Finally, it is instructive to note that normal stresses such as produce no shear do not change the molecular arrangement or pattern of the material; they change only the linear scale of this pattern, enlarging or contracting it. Change of molecular pattern is produced solely by shear strain.

Note.—This article will be followed at an early date by one giving the application of the new shear-failure theory to the Design of Beams; and giving also the the 3-dimensional or solid diagram for calculation of principal stresses and maximum shears.

ADJUSTABLE CENTERING.

We have before called attention in these columns to the great expense there is in centering work in the building trade, particularly in connection with reinforced concrete, and we have suggested that inventors should turn their attention to this subject, feeling sure that there are many improvements that might be made upon existing methods. We are therefore pleased to welcome an invention in connection with centering generally that holds out great promise. Though it may not be of universal application, it can be used for most purposes, and undoubtedly overcomes the considerable difficulties in connection with arched centers. This invention is the patent of Mr. H. E. Harwood, of Hay Green, Stourbridge.

We all know that the construction of centers is an important item in every-day building construction, chiefly indeed, for stone and brick. They are also required constantly in connection with reinforced concrete and plain concrete construction, such as in sewers, culverts, bridges, etc. Some attempts have been made to devise centers for such purposes, in which steel sheets could be bent so as to alter their curvature, but, such means did not provide sufficient latitude, nor did it give a true curvature. This invention of Mr. Harwood, however, seems to provide theoretically true centers with practical efficiency. His center consists briefly of a series of bars that can be bolted together to give roughly the outline desired, together with a number of lagging pieces that can be adjusted within the bars to take the exact curvature desired, and can be fixed roughly in position by being clamped by the before-mentioned bars by means of bolts passing through same. The lagging pieces are indeed pushed in or out of these clamping irons; that, in short, is the secret of the construction, and it is obvious that it possesses the advantages of wide adaptability and gives the exact curvature required. To increase the span is simply a matter of adding sections of the bars and laggings. In centers of wide span tie-bars are necessary to strengthen the centering against spreading.

Fig. 1.

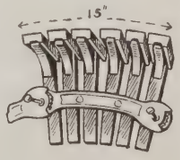

Fig. 2.

We may now proceed to a more detailed description of the centering. The binding bars or plates can be attached at the ends to foot pieces, these latter being shown in Fig. 1. These bars have toothed clutch joints at their ends, which hold them in position. Within the bars or plates are inserted the laggings, which have heads measuring 3½ ins. or 7 ins. The shape of the lagging is a T. The 3½ in. lagging is suitable for 4½ in. and 9 in. brickwork, and a 7 in. lagging is suitable for 9 in. and 14 in. brickwork. If a greater width of soffit is required, two or more centers may be connected side by side with bolts and distance pieces.

The means of giving the centering its exact contour is to set out the outline of the intended arch upon a boarded floor, and mark another line 5 ins. inside the arch line. The plates or bars (Fig. 2) are then arranged roughly round the inner line, and the laggings pushed down below the line of the intended arch. A special flexible strip of steel with pins on it, as shown in Fig. 3, is then stuck in the boarded floor to the exact curve of the arch. This provides a stop to which the laggings are pushed with the hand. When they are all exactly touching the nuts on the 2 in. bolts inserted in the joints of the bars are then screwed down tightly. If there is a key-stone in the arch just one or two laggings where these occur are pushed down to allow for it. The centering is now ready for use, but if it is of rather a wide span, then a tie is added, as shown in Figs. 4 and 5. Arches in reveal will require two centers with laggings corresponding to the soffits.

It will be obvious that such a centering cannot be so cheap to construct as ordinary centers, but, though it is more expensive in first cost, amounting to perhaps five or seven times as much as an ordinary center for any particular span, these centers of Mr. Harwood can be coupled up to make any span and any curve, and can be thus used over and over again; indeed, it is computed by their inventor that their life would be about 10 years of frequent use, that is to say, they could be used over a thousand times, and that such service could well be expected in an ordinary builder's practice. It is clearly to be seen that the initial outlay could easily be saved on a single contract. Such centers might always be kept in stock by all builders, as they should effect considerable economy in the execution of work.

Among the advantages of this form of centering we may mention that these centers take up very little room. For instance, a 10 ft. semicircular center when it leaves the works is packed in a case measuring 3 ft. 7in. long by 2ft. 4in. wide by 1ft. 4in. high, these being the outside dimensions of the case.

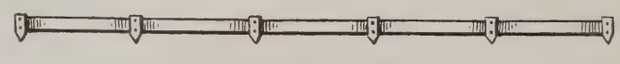

Fig. 3.

Fig. 4.

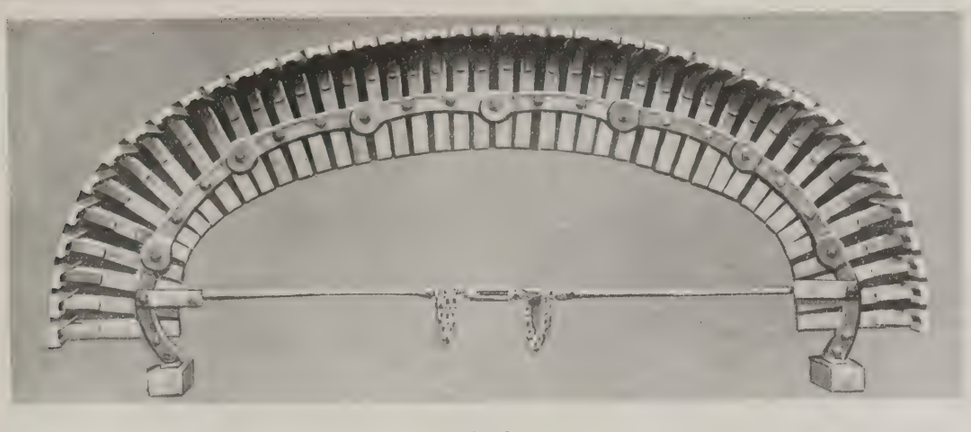

Fig. 5.

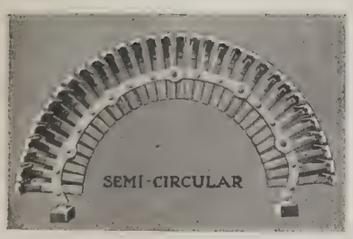

Fig. 6.

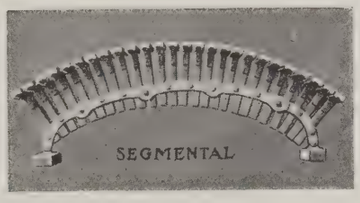

Fig. 7.

Fig. 8.

Figures 6 to 9 show how Mr. Harwood's centering may be adapted to arches of any form, either semicircular, segmental, elliptical, Gothic, or other curvature. The manner in which these are applied to the construction of fire-proof flooring with brick arches between arched steel joists is shown in Fig. 10. In this case some special hangers are used of the form shown. When used in conjunction with the hangers the height of the centering from the underside of the foot to the springing should be arranged so that no packing is necessary. In order to collapse such a centering it is only necessary to take out the bolt that secures the foot, and to withdraw the foot-piece. The centers in such a situation can be spaced about 5 ft. apart, and boards, as shown, are placed to the span between. In such a case the laggings, with 3½in. heads are as suitable as those of a larger size.

The before-mentioned illustration shows these same hangers being used for flat concrete floors. There is nothing very special about this arrangement, but it just shows that they can be used for other purposes than merely sustaining the arch centers, so that it is not necessary to have two stocks of hangers for these two purposes. These hangers are made of steel, and fit any flange of joist that may be used in practice. To draw these hangers when the concrete is properly set, it is only necessary to cut away just a little of the concrete, so as to allow one-half of the hanger to slide out. This would be facilitated considerably by placing a small piece of paper over the part of the hanger that is embedded in the concrete, or the hanger may be greased, either of which methods would prevent the concrete adhering to the steel. In the case of a brick arch, the removal of the hanger is simple, as the brick has only to be cut at the bearing on the flange of the joist over the hanger. It will be seen that Mr. Harwood's centering can easily be adapted to the construction of sewers, culverts, arches in reinforced concrete. The laggings are adjusted to the curve, and boards placed on them, as shown in Fig. 10, to retain the concrete.

The centering has been adapted to forming casings for concrete columns, also for the use of fibrous plaster manufacturers.

Fig. 9.

At the annual meeting of the British Uralite Company the chairman announced that the sales of the company's materials had increased by 21 per cent. during the period July 1st to December 31st, 1909.

* * *

Mr. R. A. Briggs, F.R.I.B.A., has taken into partnership Mr. Harry Le C. Browning, a former pupil. The style of the firm is "R. A. Briggs and Browning," and the practice will be carried on as heretofore at Amberley House, 12, Norfolk Street, Strand, W.C. Telephone, 813 Central. Telegrams, "Ambling, London."

The additions to the Commercial Travellers' Schools, Pinner, are being warmed and ventilated by means of Shorland's patent Manchester stoves, and Manchester grates, supplied by Messrs. E. H. Shorland and Brother, of Failsworth, Manchester.

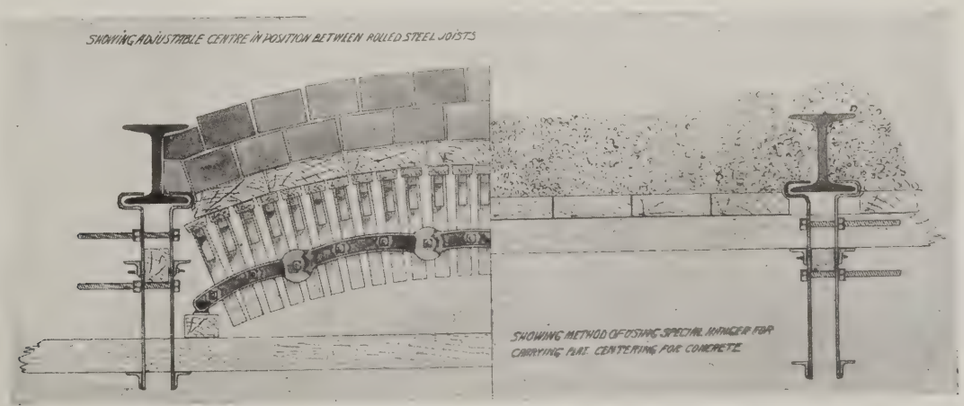

Fig. 10.

THE GUILD OF ARCHITECTS' ASSISTANTS.

A year ago an informal meeting of architects' assistants was held in London to discuss the possibility of forming a guild of assistant architects for the purpose of promoting and maintaining the interests of assistants. A provisional committee was appointed to draw up a scheme and report on the matter. This was done, and a meeting was held on Tuesday evening, January 25th, at the Bedford Hotel, Tottenham Court Road, London, to receive that report, and to form a central body of the guild, etc. Mr. R. Weir Schultz occupied the chair, and among others present were: Messrs. A. J. Penty, Herbert Cox, W. Fullerton, E. J. Dixon (hon. secretary), H. C. Bishop, A.R.I.B.A., F. F. Monro Wilson, M.S.A., Gerald Large, P.A.S.I., T. H. B. Scott, and others.

The Chairman having opened the meeting.

The Hon. Secretary read letters of regret at absence from Mr Smith, Mr Max Clarke, etc. Continuing, he stated that on February 25th of last year the provisional committee was appointed to consider certain proposals in relation to the Guild. They had made their report which he would read to the meeting. A branch of the Guild had been formed at Cardiff with some 45 members, and had proved most successful. A number of leaflets had been issued setting out the objects of the Guild, and some criticisms had been received on the grounds that the principles of the organisation were somewhat too closely allied to those of trade unionism, also objections had been taken to the amount of the subscriptions, etc. As to the subscription, remarked Mr. Dixon, the committee had seen the necessity of reducing it to 5s., which they believed was the absolute minimum. The committee had made considerable inquiry into the question of unemployment insurance, and it was hoped that every assistant would fill up the forms which had been issued by the Guild with a view of getting definite information as to the risk of unemployment, and securing the formation of a practical scheme of insurance against that risk. (Hear, hear.) He then proceeded to read the report of the Provisional Committee, which outlined the objects of the Guild as an organisation to unite all sections of the profession for mutual aid and for consideration of all questions dealing with the relationship of assistant and principal; to assist members in the matter of improvement in their professional education, and in maintaining and improving their professional status. Lastly, to organise and maintain a system of insurance. Dealing with the constitution of the Guild, the report recommended that it should consist of a central body in London and branches, governed by an Executive Council in London and branch committees. The Council was to appoint finance, legal and general committees, and a special committee was to be elected by full members to manage the insurance scheme. Further it recommended that members should be divided into two classes, ordinary members with no insurance benefits, and full members with insurance benefits. Any assistant who had held his present position, or who had been in employment continuously for 12 months previous to entry, under 40 years of age, and could produce a certificate of good health from a medical officer appointed by the Guild, and could show good testimonials as to his professional ability should be eligible for insurance benefits. The employment bureau to be managed by the secretary, who will keep lists of members (their description and qualifications) requiring employment (registered and guaranteed by local or central committee), and of employers), salary, hours, and office conditions) requiring assistants, also to reply to any local advertisements or enquiries for assistants and to obtain all necessary information concerning unemployment and situations vacant through members of the Guild or by technical journals. Fares to be advanced in special cases to established members if finance will allow. To maintain a scheme of unemployed insurance and payment of lump sums. Assistance in special cases to members approved by branch and Executive Council through a contingent fund. Employment bureaux to be open to all assistants, members and non-members, providing the latter pay a fee of 5s. if successful in obtaining an appointment. To receive all complaints relating to professional grievances, addressed either orally at a general meeting, or by letter to the secretary, and to deal with such cases either legally or otherwise. To keep the Press well informed as to the conditions of architectural practice and employment. To found scholarships or prize-money or payment of nomination fees for deserving students showing themselves capable. Among other things the scheme recommended that monthly meetings should be held, when lectures should be given on all phases of architectural practice and education. Further, it was suggested that the Guild should find scholarships or prize-money, or payment of nomination fees for deserving students showing themselves capable.

Mr. H. Cox proposed that the Provisional Committee's report should be adopted, and that the central body of the Guild of Architects' Assistants be formed, an Executive Council elected, subscriptions for the ensuing year taken, and subscriptions already made be credited. In moving the resolution, he emphasised the somewhat precarious nature of their profession, and the tendency to place architectural work in the hands of a certain commercial class of people, which did not tend to an improvement in the position of the architects' assistant. Both these things eloquently pointed to the necessity of the formation of a Guild such as was now suggested. He tabooed the idea put forward that any organisation run on trade union ideas would be derogatory to their profession and also a further criticism that the Guild would be supported by capable assistants for the benefit of incapable assistants. That event, he said, was an impossibility, and would prove a financial fiasco in a very short time. (Hear, hear.)

Mr. Penty formally seconded the motion, which was unanimously carried.

Nominations for the Executive Council were next received, and the Council was elected with the following membership: Mr. Alwyn Lloyd, Mr. H. L. Pridmore, Mr. J. V. Hibbert, F.S.I., Mr. A. J. Penty, Mr. H. C. Bishop, A.R.I.B.A., Mr. Herbert Cox, Mr. Monro Wilson, M.S.A., Mr. Barry Parker, Mr. and T. H. B. Scott. Power was reserved to co-operate others as might be deemed necessary. Mr. Gerald Large was appointed hon. treasurer, and Mr. E. J. Dixon's appointment as hon. secretary was confirmed.

The Chairman, in addressing the meeting, said that, having constituted their society, they must leave matters in the hands of the Executive Council to arrange what were the best steps to be taken next. Their programme was a very extensive one, and if it were to be realised, they must secure the support of practically the great bulk of architects' assistants. He was glad to see that the scheme had met with generous support in the provinces, especially in Cardiff, but there was still much to be done in the direction of increasing the membership. There were the architects' department of the L.C.C., of the Office of Works, and of other large public bodies. He did not know whether they had got any statistics of the numbers of assistant architects engaged in connection with these bodies, but it was important that the Guild should secure the support of these men. From the report submitted, a very comprehensive scheme was aimed at, but he should advise them to be careful to ascertain that a great deal of the work they proposed to do was not already being carried out in different ways by other existing societies. It was quite obvious that the architects' assistants as a body had not got any organisation representing their aims and aspirations, and there was much to be said in favour of the new society they were forming. He agreed there was little in the trade union objection, but with regard to the subscription, whilst on one hand it was necessary, having regard to the remuneration of members, that the subscription should be as low as possible, yet on the other hand they must bear in mind that considerable funds were necessary if they were going to carry the objects of Guild through successfully. (Hear, hear). Especially was the scheme of unemployed insurance a big one, which would require funds and would need to be run on thoroughly business lines. The very best help and suggestions they could get on that scheme were from the trade unions, who had been extraordinarily successful in this direction, and he only wished to goodness that the Government would conduct its business on equally good lines. (Laughter.) In conclusion, he urged the necessity of greater opportunities being afforded assistant architects to see and study the practical results of their work, by watching progress of buildings in construction from the architect's plans. This was a matter which might well engage the attention of the Guild. He wished the organisation every success.

Mr. Penty, in the course of a few remarks, expressed the opinion that the question of unemployment insurance would prove the whole basis upon which the society would be organised. All its activities must ultimately range round that scheme. (Hear, hear.)

Mr. Dixon said he felt sure that when the objects of the Guild became generally known, it would prove a success.

The Chairman suggested that at the beginning the Executive Council should simplify their aims as much as possible. If they showed too ambitious a programme, it might make many fight rather shy of it.

A vote of thanks to the Chairman, proposed by the Hon. Secretary, and seconded by Mr. Bishop, concluded the proceedings.

REINFORCED CONCRETE WALLS CONSTRUCTED WITHOUT CENTERING.

Reinforced concrete walls have been constructed for numerous purposes, but up to the present their chief application seems to have been in engineering structures where they are called upon to sustain considerable stresses. They would have been used to much greater extent in building construction generally if they had to sustain the same severe influences as are at work in other structures. As a general rule, walls in buildings are not subjected to much side thrust, they have perhaps to stand a small amount of wind pressure, but their chief function is to keep out the weather, and brickwork is quite suitable for the purpose. Where the walls are called upon to sustain any loads, of course, they may have to be made fairly thick. In such circumstances reinforced concrete columns can be employed to take the loads, and the wall reduced in thickness, this method resulting in panel construction, but it does not follow that these panels would be constructed of reinforced concrete with advantage; indeed, they are not, as a rule, for it has been found that the mere cost of centering or shuttering the two sides of a wall off-sets the economy of materials comprised in the reinforced concrete wall. The latter may, indeed, be built as thin as three or four inches, and be as serviceable as a nine inch brick wall, and, indeed, stronger, especially against side thrust, but it cannot compete in ordinary circumstances in England, with the nine-inch brick wall, and this, as we have said, is all that is required in most situations to keep out the weather. If, however, it is not considered quite satisfactory, we now have the opportunity of building a double wall, of, say, two, three-inch thicknesses, or 4½ inch thicknesses, namely,

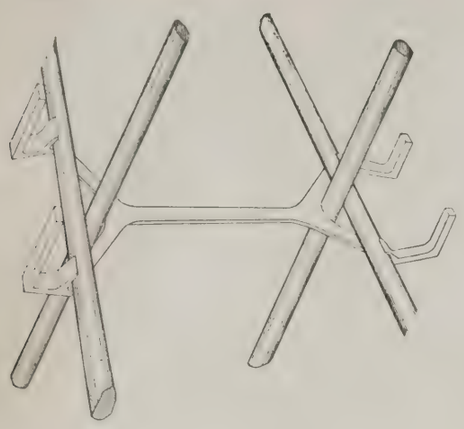

Fig. 1.

"APT" CONCRETE WALLS.

Fig. 2.

double brick-on-edge, or half-brick walls, and such construction works out as cheap, and often cheaper, than the thin reinforced concrete walls.

Concrete blocks do not offer much advantage, neither, in some situations, although they are more economical than a reinforced concrete wall built *in situ*, and are sometimes cheaper for walls than brickwork. Concrete blocks, it is true, have been moulded in various ways so as to give the appearance of stone-work, and colours have also been introduced into the facing. However, their appearance is not always favoured by architects, and, indeed, it will be readily admitted that they are not suitable in all situations. A greater variety of texture may be desired than can be obtained in concrete, unless we go to great pains and trouble with the material, which only increases its cost to a point perhaps at which we can obtain as good results, or better, in another way.

The monolithic solid reinforced concrete wall does, however, possess much strength, and could be employed far more extensively if it were not for the cost of shuttering and its appearance. Now, a new invention has recently been put forward which meets the difficulties before mentioned, and enables us to build at a low cost a monolithic reinforced concrete wall that has a good appearance. This is the "Apt" system, in which slabs or tiles are employed as a permanent centering. They are placed on both sides of the walls, and are bonded together with special ties, as shown in Fig. 1. The slabs may be of terra cotta, glazed or unglazed, or may be moulded concrete, and either material may be made with the most delicate and elaborate detail. These slabs or tiles are inter-locking, and provided with undercut ribs at the back, and they are bedded one upon the other. The metal bonders, shown in Fig. 1 are attached to rigid reinforcing members so that the whole structure forms a fixed mould into which the concrete may be tamped without disturbance. These slabs or tiles can be made in any desired texture, and any colour, and can be treated with the best decorative effect. The bonders or ties reinforce the walls also in a transverse direction, serving to make the walls monolithic, and adding to its strength against lateral pressure, and also, though perhaps not so noticeable, to its strength for sustaining vertically applied loads. The filling-in of the concrete is done in full view as the work proceeds, and the main vertical and horizontal members being locked by the bonders cannot be displaced, so that one knows that the steel is placed exactly as designed. The filling-in is done much in the same way as would be the case with timber centering, by raising the wall a short distance horizontally at a time, the slabs being fixed as the work proceeds. This system might not only be employed with advantage for walls of buildings and decorative and architectural work generally, but it offers suggestions of advantages to be obtained by its use for quays, harbour defence work, and military requirements. Bonders or ties can, of course, be made of any length or size, so as to be applicable to walls of any thickness. Its possibilities appear, however, to be chiefly in the direction of architectural work, and it affords one solution to the difficulty met with by architects in knowing how to treat surfaces of reinforced concrete walls. The address of the "Apt" Syndicate, is Bentley House, St. Mary's Road, Highbury, London, N.

THE CONCRETE INSTITUTE.

The seventh general meeting was held at the Royal United Service Institution on January 20th, when a paper on "Reinforced Concrete Chimney Construction" was read by Mr. Ernest R. Matthews, A.M.Inst.C.E. (borough engineer of Bridlington), of which the following is a summary.

Introduction.

That reinforced concrete was considered by American engineers and architects to be suitable for the construction of chimneys, the author suggested, might be gathered from the fact that during the past seven years one firm alone had erected nearly a thousand such chimneys in America, under the direction of some of the most able engineers and architects in that continent.

The subject-matter of this paper he divided into— (*a*) the advantages of using reinforced concrete for the construction of chimneys, (*b*) the erection of reinforced concrete chimneys in Great Britain, (*c*) a tabulated statement giving particulars of a number of these chimneys constructed in the United States, (*d*) the methods of calculating the stresses and strains in such chimneys, and reason for the recent failure of a shaft in the United States, (*e*) the effect of excessive heat upon concrete and reinforcement, (*f*) general notes with respect to reinforced concrete chimneys.

Economy in Cost.—It had been found in America that reinforced concrete chimneys could be built by a well-organised firm at less than one-half the cost of a brick shaft, and that the larger the shaft the greater the saving, since a large brick chimney of considerable height must have brickwork of great thickness at its base to prevent overturning.

It was also usually found that in districts where brickwork was expensive concrete was also costly, so that there was no difference in the ratio of their respective cost. It would appear, therefore, that on the ground of economy reinforced concrete had much to recommend it as a material for the construction of chimneys.

Saving of space was often a great consideration. In a shaft 300ft. in height, for example, the brickwork at the base, according to the building regulations of our English cities and boroughs, would be about 4ft. 10ins., whereas the thickness of the walls at the base of a reinforced concrete chimney would probably be as follows: outer wall 9ins., inner wall 5ins., with a space of 4ins. between the two walls. Therefore considerable economy of space was attainable by the employment of reinforced concrete for chimney construction.

Less Weight Than Brick Shaft.—This naturally arose out of the foregoing, and was a matter of the greatest importance where a treacherous soil had to be built upon.

Stability.—Reinforced concrete chimneys had been erected in the United States for some years past, and the author knew of only one failure. Reinforced concrete lent itself admirably to chimney construction, a recommendation which could not be so confidently asserted with regard to brickwork. The author considered that a reinforced concrete chimney, if properly designed, was of greater stability than one built of brick, since the former had no joints, whereas in a brick shaft failure might occur at any of the joints.

Freedom from Repairs.—Once erected, reinforced concrete chimney shafts required practically no repairs, while steel-plate chimneys required painting about every four years, and brick chimneys occasionally required repairing.

Rapidity of Execution of Work.—This was well known; a reinforced concrete chimney could be erected in half the time that it took to build a brick shaft.

These were some of the advantages which the author claimed for the use of this material in chimney construction.

Typical Examples of Reinforced Concrete Chimneys in Great Britain.

The author then referred very briefly, before giving American examples to one or two of the reinforced concrete chimneys which had been erected during the past few years in this country. Several of such chimneys might be referred to, but the object of the paper was to deal chiefly with those erected in the United States, so that only a few were mentioned.

Chimney at Messrs. Lyle and Sons' Works, London, E.—The shaft erected a short time ago at the works of Messrs. Abraham Lyle and Sons, Ltd., of London, E., was a good example of what could be done in reinforced concrete. This chimney was 261ft. in height, and 20ft in diameter. The walls, for the upper two-thirds, were 8ins. in thickness, double walls being built in the lower third. The reinforcement consisted of vertical bars consisting of 1¼ins. × 1¼ins. × $\frac{3}{16}$ ins. T's and horizontal rings of $\frac{5}{8}$in. steel rods spaced at 18-in. centres, vertical bars extending into the concrete foundations.

Chimneys at Briton Ferry, Glamorgan, and at Belfast The chimneys recently

erected for the Cape Copper Co., Briton Ferry, Glamorgan, and for Messrs. J. and S. M. Greeves, Ltd., of Belfast, were also good examples. The dimensions were as follows: heights, 150ft. and 200ft.; diameters of outer shells, 13ft. and 8ft. 6ins. respectively.

Large Chimney at Northfleet.—This had recently been erected; it was 8ft. 6ins. inside diameter, and 247ft. in height above bottom of foundations, and was a fine example of reinforced concrete construction. The foundations, the bottom of which was 35ft. below ground-level, were remarkably shallow, being only 2ft. tapering to 4ft. in thickness, and 18ft. × 18ft. in area. A 6-in. baffle wall was constructed across the lower portion of the shaft, and the thickness of the shell up to 62ft. above the ground-level was as follows: outer shell, 12ins.; cavity, 4ins.; inner shell, 4ins. Above this the chimney consisted of a single shell 9ins. in thickness. The reinforcement in the foundations consisted of 1¼ins. × 1¼ins. × $\frac{3}{16}$ins. T's, and in the shell of horizontal rings of steel ⅝in. diameter, spaced 18ins. apart, and vertical bars formed of 1¼ins. × 1¼ins. × $\frac{3}{16}$ in T's.

Smaller Chimney at Northfleet.—Although a smaller chimney, 130ft. high, the one recently erected at the "Bevan's Works," Northfleet, was of much interest. The shallow depth of the foundation was rather remarkable. While this was 15ft. 6ins. square in area, the depth was only 3ft. tapering to 2ft. The inside diameter of the chimney was 5ft. The bottom of the foundation was 16ft. below ground-level, and this was reinforced by 1¼ins. × 1¼ins. × $\frac{3}{16}$ in. bars. For a height of 41ft. above ground-level the outer shell was 6ins., the inner 4ins. in thickness with a 4-in. cavity between; 9-in. diameter air inlets occurred at intervals; above this the chimney consisted of a single shell only 5ins. in thickness. The shell was reinforced by means of vertical bars and horizontal rings, the former being deflected around smoke flues. The vertical bars consisted of 1¼ins. × 1¼ins. × $\frac{3}{16}$ in. T's, the rings being ⅝in. diameter steel rods placed 18ins. apart. At the bottom of the offset flat rings 3ins. × ½in. were inserted.

The two foregoing shafts had been erected for the Associated Portland Cement Manufacturers, Ltd., at their works at Northfleet.

Methods of Calculating Stresses in Reinforced Concrete Chimneys.

An excellent article, entitled "The Design of Ferro-Concrete Chimneys," appeared in "Engineering" for March 31st, 1908. In this the authors—Messrs. Taylor, Glenday, and Faber—describe in detail the methods of calculating the stresses in chimneys of this material. There was not sufficient space in the paper in which to deal with this part of the subject, and the author therefore referred members to the before-mentioned article.

With regard to the recent failure of a chimney in the United States the conclusions arrived at by the authors before named were interesting and instructive. They said:—

"It would appear, therefore, that while the thickness of concrete was ample, there was not nearly enough steel to ensure safety, and, of course, this deficiency in steel greatly increased the pressure on the concrete by throwing the line of zero stress away from the centre of the chimney, and thus leaving a very small proportion of the section in compression. . . . The failure of this chimney cannot be said to cast any reflection upon the use of properly designed reinforced concrete for such structures."

Effect of High Temperatures.

In order to obtain some reliable data regarding this important matter the author determined to carry out series of tests, and he gave detailed particulars.

The author determined to obtain some information regarding the condition of the concrete and reinforcement in an existing reinforced concrete chimney, and he acknowledged his indebtedness to Mr. H. K. G. Bamber, F.I.C., of the Associated Portland Cement Manufacturers, Ltd., who kindly supplied him with some most useful information on this subject.

Mr. Bamber informed the author that in order to ascertain if concrete deteriorated through the effects of heat, he inspected on several occasions the face of the concrete shell inside the reinforced-concrete chimney at the works of his firm at Northfleet, and he failed to observe any signs of deterioration. Not contenting himself with this, he subjected the ash in this chimney, on various dates, to an analysis, and compared this with an analysis of the ash taken from the base of a brick Custodis shaft, also at his firm's works at Northfleet. The comparison was most interesting; there was very little difference in the percentage of insoluble residue present, which residue would, of course, include any portions of sand that might, from deterioration, be coming away from the inside of the inner shell of the concrete chimney.

Mr. Bamber kindly had a small hole cut out for the author in the base of the inner and outer shells of the reinforced-concrete chimney at Northfleet for the purpose of exposing a portion of the reinforcement. These were made just over the flue opening where the heat would be most likely to affect the concrete. The result was most satisfactory, the steel being in as good condition as when first inserted in the concrete.

The author's experiments led him to the following conclusions:—

(1) That neat cement behaved better under great heat than out of it. The average compressive strength of 2¾-in. cubes placed in flue for 28 days, after having remained in air for 14 days, was 52.6 tons on the cube compared with 33.6 tons when placed in water for a similar period; the tensile strength per sq. in. of the briquettes being 1,008 lbs., compared with 850 lbs. in the water test.

(2) That concrete (3 parts standard sand to 1 part Portland cement) if not well set behaved very badly under heat. The average tensile strength of briquettes 1-in. section (3 to 1) placed in flue for 28 days, after being in air for 14 days, was 105 lbs., compared with 310 lbs. at 7 days, and 460 lbs. at 28 days in water.

(3) That if the concrete had had at least a two-months' set before heat was applied a temperature of 900 degs. Fahr. would not affect it in the least. This might be taken as the safe temperature in reinforced-concrete chimneys.

(4) That the 3 to 1 specimens in these tests giving such poor results pointed to the necessity of having no voids whatever in any concrete work, it being well known that 3 to 1 briquettes made of standard sand contained a considerable quanitity of air spaces.

(5) That only allowing the specimens 14 days before subjecting them to the heat was far too short a period in actual work. The greatest advantage was obtained by letting the heat get at the concrete after the longest time had been given for the cement to set.

(6) Concrete mixed with 10 per cent. of water (which should be the maximum in work of this class) would contain only about 1 per cent. of free water after a two-months' set. Heat should not be applied to concrete until the latter had had a two-months' set, a longer set than, say, three months would be preferable.

Notes in General.

Reinforced-concrete chimneys had been objected to on the following grounds: (1) because occasionally during the hardening of the concrete hair cracks have been noticed on the concrete surface, and it had been thought that these might affect the temperature in the chimney and consequently the draught; (2) because chimneys constructed of this material were, in the opinion of some, unsightly.

With regard to the first objection, the author admitted that hair cracks did frequently occur when a large concrete surface was setting, but these were only skin deep, and in the case of a chimney could not possibly affect the internal temperature. As to the second objection, there was no reason why a reinforced-concrete chimney should be unsightly; it could be made ornamental if required so, and at no great extra cost.

The aggregate in the concrete in the case of chimneys was fine, but coarser material was used in the foundations. All concrete was well tamped. The factor of safety used by well-known chimney builders in America was between 4 and 5, and provision was frequently made for stresses which would be set up by a maximum wind velocity of 100 miles an hour, a velocity which was practically unknown.

In this country it is not at all likely that a chimney would ever be subjected to such a test, but in America there was a likelihood that it might be. During the Galveston (Tex.) tornado, for example, which occurred in September, 1900, the force of the wind was registered at 50 lbs. per sq. ft. on a surface at right angles to the direction of the wind. It had been the custom both in Great Britain and America to take the maximum wind pressure at 50 lbs. per sq. ft. on a square shaft, and half this on a circular shaft.

No tensile stresses on the concrete were allowed for. The chimneys were well anchored by continuing the vertical steel bars into the foundation and then bending them through 90 degrees. The large number of vertical bars in the outer shell was divided into two portions, one-half of which were bent to reinforce the upper part of the foundation slab, and the other half, which alternated around the chimney, were bent at the bottom of the slab. All of the vertical bars in the inner or expansion shell were carried down into the foundations and bent over. Continuity in the steel was provided by overlapping the ends of the bars at least 30 diameters. All wind stresses were provided for by the vertical steel reinforcement, and temperature stresses by the horizontal rings of plain round rods (as already described) bent to a true circle. These latter were spaced not more than 18ins. apart vertically, and, as in the case of joints in the vertical steel, the breaks in the bars were staggered so as to occur unevenly and form no plane of cleavage. Additional ring steel was placed at any bends in the vertical steel, as at the offset and foundation. In designing a chimney the stresses were computed at several sections

The foundations were frequently reinforced by two meshes of steel bars as already explained, the top mesh running at right angles to the side of the foundation for its full width, the bottom mesh consisting of bars laid diagonally in each direction at an angle of 45 degrees from the side of the foundation. Additional vertical bars should be placed on the sides of the smoke opening to take the place of those omitted in that opening, and additional bars placed above and below the smoke opening to furnish lintel and sill reinforcement.

The forms used in the construction of reinforced chimneys were necessarily somewhat complicated and intricate.

(To be concluded).

Mr. Eustace L. Haynes, architect and surveyor, has removed his offices to more commodious premises at 120, Newgate Street. Telephone Number as before: Holborn, 2390.

* * *

Mr. Goode, "Our Man" of the "Evening News," whose recent doings have created such widespread interest, devoted Tuesday, January 18th, to visiting the works of the British Uralite Co., at Higham, where he was much impressed by a test demonstrating the remarkable fire-proof qualities of uralite. Various chemicals affected at temperatures from 100 degs. to 170 degs. Fahr. were placed together with sundry papers in a wooden box lined inside and outside with uralite. The box was then placed in a furnace, the maximum temperature recorded by pyrometer being 1,750 degs. Fahr. After being subjected to this fierce heat for an hour, the box was withdrawn uninjured, and its contents were found unaffected.

My Wages ARE 20% HIGHER

Salaries or Wages have a way of growing larger or smaller in these days. It was never easier than now to find them dwindling to nothing. Nor was it ever so easy to keep on increasing both your remune ation and standing.

As the following letter shows, the system of instruction and "help to employment" provided by the International Correspondence Schools, enables you to obtain **practical technical training** in **any** occupation you choose, and to raise **yourself** from **one post to another**—no ma ter what your **present** position or occupation —without leaving home or loss of time from present employment.

"Just a line to let you know that I started work on Monday the 7th, at the situation which I secured through the Birmingham Branch of your 'Students' Aid Department.'"

"I cannot fully express my thanks in these few lines for so great a change in my working conditions after so short a period of study as seven months. **My wages are 20 per cent. higher; my hours much shorter, and the work altogether more congenial.**"

LET US REFER YOU TO SUCCESSFUL I.C.S. STUDENTS in YOUR own DISTRICT.

Send a postcard mentioning the line of work in which you are interested. We will forward, free, by return, full details of the I.C.S. Course, and the names of neighbouring students to whom you can refer.

You'll not be obliged to go a step farther, but you'll want to.

PARTIAL LIST OF I.C.S. COURSES.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about **five days** or longer after the date of this issue.
Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders.
The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the Contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Jan. 28—Feb. 7. **DEVONPORT.**—Erection of nursing staff quarters and reconstruction of the military families hospital, at the Raglan Barracks, Devonport, in the Southern Command, for the Secretary of State for War. Plans, specification, and conditions of contract may be inspected at the office of the Director of Barrack Construction, 80, Pall Mall, London, S.W., or at the Barrack Construction Office, Old Granby Barracks, Devonport, up to Jan. 26. Those desiring to tender and to receive a copy of the bills of quantities must apply to the Director of Barrack Construction not later than Jan. 28. The application must be accompanied by a deposit of 10s. Cheques or orders to be made payable to the Assistant Financial Secretary and crossed "Bank of England for credit to Army Funds." Tenders must be delivered to H. De la Bere, Director of Army Contracts, War Office, Whitehall, London, S.W.

Jan. 28—Feb. 7. **DUBLIN.**—Erection of mortuary and disinfecting establishment, Arbor Hill Hospital, Dublin, in the Irish Command, for the Secretary of State for War. Plans, specification, and conditions of contract may be inspected at the office of the Director of Barrack Construction, 80, Pall Mall, London, S.W., or at the Barrack Construction Office, Arbor Hill Hospital, Dublin, on Jan. 24, 25, and 26. Those desiring to tender and to receive a copy of the bills of quantities must apply to the Director of Barrack Construction not later than Jan. 28. The application must be accompanied by a deposit of 10s. Cheques or orders to be made payable to the Assistant Financial Secretary and crossed "Bank of England for credit to Army Funds." Tenders must be delivered to H. De la Bere, Director of Army Contracts, War Office, Whitehall, London, S.W. The bills of quantities should accompany tender in a separate sealed envelope, similarly addressed.

Jan. 28—Feb. 7. **ABERDEEN.**—Execution of mason, carpenter, slater, and plaster works of the following buildings:—Tarves:—1, James Lewis, Oldmill of Schivas, dwelling house; 2, John Bruce, Hunkerhill, dwelling house; 3, Mrs. Scorgie, Courtstone, additions to dwelling house; 4, W. G. Smith, Upper Kirton, dwelling house. Methlick:—5, John Beaton, Brownhill, dwelling house; 6, George Gibb, Newton, dwelling house; 7, James Coutts, Cairnorrie, dwelling house; 8, George Simpson, Belnagoak, dwelling house. Fyvie:—9, John P. Sleigh, St. John's Well, cottage; 10, Alexr. Chalmers, Swanford, dwelling house; 11, George Young, Little Gight, dwelling house; 12, James Taylor, Blackhillock, dwelling house; 13, Peter Castle, Clovery, dwelling house; 14, John Forsyth, Blackpool, dwelling house. New Deer:—15, James Ironside, Myre of Bedlam, additions to house. Contractors for Swanford should meet the architect there on 28th inst., at 1 p.m. Plans and specifications may be seen with the tenants and at the estate office. Sealed tenders to be lodged with Charles G. Smith, Factor, Haddo House.

Jan. 29—Feb. 9. **REDFORD.**—Execution of the following work, for the Secretary of State for War:—Foundation work for barrack block, excavating and levelling site for new cavalry barracks, Redford, in the Scottish Command. Plans, specification, and conditions of contract may be inspected at the Office of the Director of Barrack Construction, 80, Pall Mall, London, S.W.; or at the Temporary Barrack Construction Office, Colinton, on Jan. 27. Those desiring to tender and to receive a copy of the bills of quantities must apply to the Director of Barrack Construction not later than Feb. 1, accompanied by a deposit of 10s. Cheques or orders to be made payable to the Assistant Financial Secretary, and crossed "Bank of England for credit to Army funds." Tenders must be delivered, addressed to the Director of Army Contracts, War Office, Whitehall, London, S.W.

Jan. 31—Feb. 19. **PAULTON (near Bristol).**—Erection of church house, for the Committee. Builders desirous of tendering should, before the 31st inst., send their names to the Rev. S. Herbert, The Vicarage, Paulton. Plans and specifications may be seen at the Rev. S. Herbert's, or Melhuish and Sons, on and after Feb. 4. Bills of quantities may be obtained on deposit of £1 1s. Tenders are to be delivered to the Rev. S. Herbert.

Feb. 2—9. **MITCHAM (Surrey).**—Erection of additions to the schools at Mitcham, Surrey, for the Holborn Union. Specification, form of tender, and a copy of the drawings, up to Feb. 2, upon application to the Guardians' Architect, A. Saxon Snell, F.R.I.B.A., 22, Southampton Buildings, Chancery Lane, W.C., and depositing with him a £5 Bank of England note. Tenders to be delivered to J. Allan Battersby, Clerk to the Guardians, Guardians' Offices, 53, Clerkenwell Road, E.C.

Feb. 3. **HARTSHILL.**—Builders desirous of tendering for alterations and additions to the laundry block at the N.S. Infirmary, Hartshill, should send their names to R. Scrivener and Sons, Architects, Hanley, by above date.

Feb. 3—15. **ERDINGTON.**—Erection of a house for the Master of the Workhouse at Erdington, for Aston Union. Persons desirous to tender are invited to send their names and addresses by 3rd instant to John North, Clerk to the Guardians, Union Offices, Vauxhall Road, Birmingham, to whom tenders are to be sent. Drawings and specification can be inspected at the office of Whitwell and Son, Architects, 3, Newhall Street, Birmingham. Copies of quantities and forms of tender will be sent to applicants on deposit of £5 with the Architects. Fair wages clause.

Feb. 4—7. **ASHBY (Lincs.).**—Erection of an elementary school at Ashby, near Scunthorpe, Lincoln, for the Lindsey County Council Education Committee. Bills of quantities and form of tender may be had on application to Scorer and Gamble, Architects, Bank Street Chambers, Lincoln, on or before Feb. 4, and on deposit of £2 2s. Drawings and conditions of contract may be inspected at the offices of the Architects. Tenders must be delivered to S. Maudson Grant, Secretary, 286, High Street, Lincoln.

Feb. 4—25. **BELLSHILL (Lanark).**—Erection of buildings to contain refuse destructor; also steel chimney stack; provision of water supply and drainage, and formation of access road and other relative works at Boggs Brae, near Bellshill, for the C.C. Plans may be seen, and copies of specification and schedule of measurement obtained at the office of W. L. Douglass, C.E., District Engineer, District Offices, Hamilton, on deposit of £1. An assistant engineer will meet intending contractors at Bothwell Bridge at 10.20 a.m., on Feb. 4. Tenders must be lodged with the Clerk to the Local Sub-Committee, James Forsyth, the Cross, Bellshill.

Feb. 7. **MARGATE.**—Alterations to cottages at the Wingham pumping station, and the redecoration of the interiors. Plan and specification can be seen and all further particulars obtained on application to E. A. Borg, Borough Surveyor, 13, Grosvenor Place, Margate. Tenders should be sent to Edward Brooke, Town Clerk, Margate.

Feb. 7. **HALIFAX.**—Masons', joiners', plumbers', and glaziers' work required in the conversion of old engine house into workshops at Woodside Mills, Haley Hill. Plans and specifications may be seen and bills of quantities obtained from Joseph F. Walsh, F.S.I., Graham Nicholas, F.R.I.B.A., Architects and Surveyors, Museum Chambers, Halifax.

Feb. 7. **PETTAUGH (near Stowmarket).**—Erection of a new school for about 60 children at Pettaugh, near Stowmarket, for the East Suffolk County Education Committee. Builders who desire to tender should send in their names, accompanied by a deposit of £1 1s. (cheques to be made payable to W. E. Watkins), by 8th inst., to W. E. Watkins, Secretary, Education Office, County Hall, Ipswich, to whom tenders are to be sent.

Feb. 7. **CARDIFF.**—Erection of proposed riding school and stabling, on the Barracks Field, Cardiff, for the Glamorgan County Territorial Force Association. Plans and specification to be inspected at the office of the Architect, W. H. Dashwood Caple, F.R.I.B.A., 2, Church Street, Cardiff. Copies of the bills of quantities may be obtained on deposit of £1 1s. Tenders to be delivered to Capt. C. J. Wilkie, Secretary, 20, Dumfries Place, Cardiff.

Feb. 7. **CARDIFF.**—Partial reconstruction, restoration, and renovation of the following blocks of houses:—1, six houses, Beresford Road, southwest side; 2, three houses, Beresford Road, northeast side; 3, two houses, Moorland Road, for the Corporation. Plan, specification, and form of tender, may be obtained at the office of Wm. Coming Events.

Wednesday, February 2.

ROYAL ARCHÆOLOGICAL INSTITUTION, 20, Hanover Square, W.—Mr. Andrew Oliver, Exhibition of "Two Alabaster Tables," Mr. P. M. Johnston, "Discovery of Early Wall Paintings in Kingsdown Church, Farningham," 4 p.m.

Thursday, February 3.

SOCIETY OF ANTIQUARIES, Burlington House, W.—Meeting, 8 p.m.

CARPENTERS' COMPANY LECTURES. — Sir Brumwell Thomas, on "The Joiners' Craft," Carpenters' Hall, 7.30 p.m.

Friday, February 4.

INSTITUTION OF CIVIL ENGINEERS.—Students' meeting. Mr. L. T. Wilson on "The construction and setting out of a low level sewer," 8 p.m.

ARCHITECTURAL ASSOCIATION.—Mr. W. H. Ward, on "Renaissance Church Architecture in France during the 16th Century," 7.30 p.m.

LEICESTER AND LEICESTERSHIRE SOCIETY OF ARCHITECTS.—Mr. Arthur Marshall on "Some Spanish Places and People," 8 p.m., at 5, St. Martins East.

Saturday, February 5.

ABERDEEN ARCHITECTURAL ASSOCIATION.—Discussion meeting. Mr. H. F. David, on "Alfred Stevens: his life and work," 7.30 p.m.

Monday, February 7.

BIRMINGHAM MUNICIPAL SCHOOL OF ART.—Exhibition of Students' Work opens at Rooms of Royal Society of Artists, New Street, and continues until February 19th inst., 10 to 10 each day.

THE SOCIETY OF ENGINEERS AND CIVIL AND MECANICAL ENGINEERS' SOCIETY (amalgamated Jan., 1910, under title of first named).—First ordinary meeting of the new society, Room 18, Caxton Hall, Westminster. Presidential address by Mr. D. A. Symons, M.Inst.C.E., 7.30 p.m.

THE ROYAL SANITARY INSTITUTE LECTURES.—Dr. Charles Porter on "Sanitary Law," 7 p.m.

THE SURVEYORS' INSTITUTION.—Mr. T. A. Dickson's paper on "The Report of the Royal Commission on the Poor Laws," is postponed. Adjourned discussion on Mr. Davidge's paper on "Town Planning Systems," and Mr. J. Willmott's paper on "The Housing, Town Planning, etc., Act, 1909," 8 p.m.

Tuesday, February 8.

UNIVERSITY EXTENSION LECTURES ON ANCIENT ARCHITECTURE. — Mr. Banister Fletcher on "Roman Circi, Triumphal Arches and Town Gateways," British Museum, 4.30 p.m.

Wednesday, February 9.

CARPENTERS' HALL LECTURES. — Mr. Arthur Stratton on "Native Craftsmanship in Timber, Brick, and Stone, before the 18th Century," 7.30 p.m.

THE ROYAL SANITARY INSTITUTE LECTURES.—Dr. Charles Porter on "Sanitary Law," 7 p.m. *At Sessional Meeting*, Rev. J. B. Lock on "The Ventilation of the Large Examination Hall, Cambridge," 8 p.m.

Thursday, February 10.

PAINT AND VARNISH SOCIETY.—Mr. J. W. Lovibond on "Colour Nomenclature," 8 p.m., at the St. Bride's Institute, Bride Lane, E.C.

Friday, February 11.

THE ARCHITECTURAL ASSOCIATION DEBATING SOCIETY.—(Joint Meeting with the Junior Institution of Civil Engineers). Mr. F. R. Durham, A.M.Inst.C.E., on "Architectural and Engineering Consideration Town Planning," 7 p.m.

THE ROYAL SANITARY INSTITUTE LECTURES.—Dr. Charles Porter on "Sanitary Law," 7 p.m.

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS (Southampton Row, W.C.).—Mr. E. F. Strange on "Lettering," 8 p.m.

Monday, February 14.

THE ROYAL SANITARY INSTITUTE LECTURES.—Mr. Wellesley Harris on "The Duties of a Sanitary Inspector," 7 p.m.

Tuesday, February 15.

UNIVERSITY EXTENSION LECTURES ON ANCIENT ARCHITECTURE. — Mr. Banister Fletcher on "Roman Tombs, Pillars of Victory, Aqueducts, and Bridges," British Museum, 4.30 p.m.

ILLUMINATING ENGINEERING SOCIETY.—Resumed discussion on Dr. J. H. Parson's paper, "Glare, its causes and effects." 8 p.m. at Society of Arts, John Street, Adelphi.

Wednesday, February 16.

CARPENTERS' HALL LECTURES. — Mr. Lawrence Weaver on "The Art of the Leadworker," 7.30 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION.—Students' Meeting. Mr. W. Milburn, jun., on "Notes on Continental Hospitals," 7.30 p.m.

Appointments Wanted.

The charge for Advertisements under this heading is 1s. 6d. per insertion for the first four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two. Advertisements can be received up to 5 o'clock on Monday evening.

ACCURATE QUANTITIES prepared by London Surveyor of experience, in shortest possible time; reasonable terms; provincial work undertaken; jobs measured and settled anywhere.—Surveyor, 34, Chambers Lane, Willesden, London, N.W. 'Phone, 553 P.O. Willesden.

ARCHITECT'S Assistant (28), skilful draughtsman, design, contract drawings, details, perspectives, surveys, etc.; travelling studentship winner; moderate salary.—Box 5477, BUILDERS' JOURNAL Office.

ARCHITECT and Surveyor's Junior Assistant, 5 years' experience, details, working drawings, surveying and levelling, or would represent first-class firm to call on architects, etc.—W. Waller, Kensington Road, Barnsley. 5505

ARCHITECT'S Junior Assistant, 5 year's experience; quantities, specifications, levelling, domestic, church work, working drawings, neat draughtsman; excellent references; moderate salary.—Box 5503, BUILDERS' JOURNAL Office.

ARCHITECT'S Assistant (24), with excellent references, urgently asks appointment with architect, builder, or manufacturer. Travelling Studentship winner.—Please reply Box 5482, BUILDERS' JOURNAL Office.

ARCHITECT'S Assistant (31), 15 years' experience; estate work, reinforced and steel frame buildings; 4 years in U.S.A.; working drawings, details, perspectives, specifications, quantities, etc.—Apply Box 5465, BUILDERS' JOURNAL Office.

ARCHITECT'S Junior Assistant (21), desires change, London office; Inter R.I.B.A., competitor measured drawings medal R.I.B.A.; 6 years provincial and London experience; good draughtsman; working drawings; assist quantities, perspectives, construction certificates.—Box 5472, BUILDERS' JOURNAL Office.

ARCHITECT, or Builder's Assistant, six years' experience; good draughtsman, working drawings, details, tracing, colouring, specifications, surveying, etc.; typewriting, general office routine.—A. L. "Homelea," Wokingham, Berks. 5476

ARCHITECT'S Assistant; 11 years' experience; design, details, specifications, quantities, surveying, levelling, estate work; reliable worker; excellent testimonials; state salary.—Box 5492, BUILDERS' JOURNAL Office.

ARCHITECT'S Assistant (22), just completed 5 years' articles in good provincial office, seeks engagement to generally assist in architect's or builder's office; varied experience; good draughtsman; excellent reference; salary £1 per week to begin.—Box 5490, BUILDERS' JOURNAL Office.

ARCHITECT'S Assistant (33), recently earning four guineas a week, desires situation three or four days per week; would accept 9s. per day. First-class draughtsman, quantity surveyor and measurer.—Allen Hart, 50, Copthall Avenue, E.C. 5508

BRICKLAYER; general; sound experience; recent engagement, Welbeck Hotel, W.; age 40.—A., 157, Brondesbury Villas, Kilburn, N.W. 5494

BUILDER'S situation required with good firm; 10 years with architect; plans, details, specifications, survey, and level; superintend work; could invest capital if desired.—Box 5488, BUILDERS' JOURNAL Office.

ESTATE Clerk of Works desires engagement; over 20 years' practical experience developing large estates for London Company; exceptional testimonials.—Box 5497, BUILDERS' JOURNAL Office.

EVENING assistance rendered in preparation of plans, working drawings, specifications; some experience of theatres; in or out of office; moderate terms.—Box 5495, BUILDERS' JOURNAL Office.

GENERAL Foreman or outside Manager seeks re-engagement; age 27; ten years' experience; able to take charge of building estates, etc.; well up in all trades; setting out, preparing drawings, measuring up and usual office routine.—Box 5483, BUILDERS' JOURNAL Office.

GENERAL Foreman (35), disengaged; competent all branches of the trade, trustworthy, reliable; good references and a good timekeeper.—Apply, Rashleigh, 41, Palace Road, Crouch End, N. 5506

JUNIOR Assistant (5 years' experience, London) desires engagement; moderate salary. — Apply, J. C., 10, John Street, Adelphi, W.C. 5504

PLUMBER desires engagement as Foreman; job or constancy; can prepare and execute schemes for heating and sanitary engineering; wide experience; good references.—Box No. 5475, BUILDERS' JOURNAL Office.

QUANTITIES and specifications prepared by experienced surveyor, quick and accurate; reasonable terms.—Box 5484, BUILDERS' JOURNAL Office.

REINFORCED Concrete.—A specialist is prepared to give instruction in practical applications of structural design to reinforced concrete. — Apply, A.M.I.C.E., Box 5453, BUILDERS' JOURNAL Office.

REINFORCED Concrete.—Experienced estimator and Surveyor seeks engagement with firm of contractors; designs, quantities, estimates, supervision, good organiser and manager; age 31.—Box 5496, BUILDERS' JOURNAL Office.

REINFORCED Concrete Expert to Jamaican Government for re-building Kingston, has controlled since December, 1907, design and erection work representing expenditure several hundred thousand pounds, seeks an appointment.—Box 5507, BUILDERS' JOURNAL Office.

TIMEKEEPER, Storekeeper, or Yard Foreman seeks re-engagement; town or country; well up in materials and plant; good references.—R. C., Upton Cottage, Carlyle Road, South Ealing. 5467

TYPEWRITING Architect's Specifications and Reports, a speciality; sketches inserted; all work cheaply and promptly executed; estimates given. —Address, "Typist," 2, Marsham Street, Westminster. 5489

Appointments Vacant.

AN Architect and Surveyor has a Vacancy in busy city office for a well-educated youth as Articled Pupil; good opportunity for obtaining general experience; moderate premium, returnable in salary. —Write, Z., care of Burbidge's, 62, Moorgate Street, E.C. 5502

APPLICATIONS for Appointments arranged effectively; appreciated by recipients; numerous unsolicited testimonials. — Write now, Herbert Greatorex, Hackney, Matlock.

BUILDER'S Clerk wanted; experienced in prime cost and general office routine; should be able to make drawings of plain buildings and take off quantities; state age, salary required, and particulars of previous engagements; shorthand and typist preferred. — C. Hensman and Son, Horncastle.

GOOD, smart, energetic Traveller wanted to represent a joinery firm in West Middlesex. Must be thoroughly conversant with the trade.—Apply by letter only, stating age, experience, and salary required, to Avery and Vincent, Southall, W.

SARUM Wrought Iron Works.—Smith wanted for about three months; must be good at ornamental foliage work.—Apply, stating wages and particulars, Miss Purvis, The Close, Salisbury.

STEADY Working Foreman wanted, accustomed to managing men and estimating for decorations and general interior work; West-end experience; good references necessary.—Apply by letter only, Storey and Co., Kensington High Street, W.

Reinforced Concrete.

Designs, plans, etc., prepared by a specialist, for any kind of construction, according to client's requirements, and not necessarily on any particular system.—Apply, Box 5460, BUILDERS' JOURNAL Office.

Miscellaneous.

BRICKS, best Belgian, three sizes, strong and well made, pretty colourings, absolutely water and fire proof; also **TILES;** also **CEMENT BRICKS;** prices upon application to P. Rapaert de Grass, Santa Koro, Shanklin, I.W.

For **ELECTRIC COPIERS** and Daylight Printing Frames, Try B. J. HALL AND CO., LTD., 39, Victoria Street, Westminster.

"JOHN BULL" BRAND.—Duplicators, Carbon Papers, Ribbons, Printing, Stationery, and complete office outfits.—Write, Read Manufacturing Co., 63, Finsbury Pavement.

SECOND-HAND Optical Mart. For the Purchase and Sale of LEVELS, THEODOLITES, DRAWING INSTRS. —Clarkson's, 338, High Holborn, London, W.C. (Opposite Gray's Inn Road).

WHAT Offers? 239 copies of "Builders' Journal," good condition, 1905 to 1909.—Apply, M. Ferguson, Builder, Harrington, Cumberland. 5501

Property to be Let or For Sale.

By order of the Owners, on account of completion of estate development.

UXBRIDGE ROAD, SHEPHERD'S BUSH, W.

The capital BUILDERS' and CONTRACTORS' STOCK, PLANT, and MACHINERY, including an 8-h.p. Campbell's gas engine, and 8-h.p. ditto oil engine, 2 7ft. mortar mills, the remaining stock of timber, 150 pedestal closet seats, new doors, sashes and frames, hall screens, overdoors, mirrors, panelling, pilasters, and prepared joinery work, high-class chimneypieces and overmantels in Elizabethan, Adam, Georgian, and other styles; 3,000 pieces of modern paper-hangings, about 150 gallons of assorted varnishes, 20 gallons of engine-oil, etc., glass, leaded lights, a general assortment of builder's ironmongery and brass foundry, plumber's and gasfitter's brass work, r.w. goods and general castings, ranges and stoves, gas and electric light fittings, 70 Doulton's white enamelled and other sinks, lavatory basins and stands, stoneware sanitary goods, 3,000 wall, stove, hearth, and paving tiles, 12,000 Fletton, blue Staffordshire, and other bricks, 3,000 roofing tiles, roofing slates, chimney pots, etc., scaffold boards, poles, put logs, and ladders, 4 portable offices, and portable cement shed, scaffold cords, rope falls, navvy barrows, portable forge, and a general assortment of builder's tools and stores, together with the capital timber and corrugated iron buildings, which will be SOLD by AUCTION by

MESSRS J. T. SKELDING AND HOLLAND, at the Works Yard, OLD OAK ROAD, Uxbridge Road, W., on THURSDAY, FEBRUARY 10th, at 11.30 o'clock.

Auction Offices, 48, Gresham Street, Guildhall, E.C.

To Clear the Site for Building Operations.

KNOLLYS CROFT, Leigham Court Road, Streatham, S.W. (about five minutes from Streatham Hill Station).

MESSRS. HOOKER AND WEBB have received instruction to SELL by AUCTION, on the SITE as above, on WEDNESDAY, FEBRUARY 2nd, 1910, at 1 o'clock, the valuable BUILDING MATERIALS, comprising:—

50,000ft. boards, joists, quartering, 12,000 old plain tiles, 3,000 nib tiles, doors and frames, sashes and frames, York stone paving, marble paving, stable fittings, Staffordshire blue bricks, stackpipe, chimney-pots, ledge doors, coach-house gates, paving tiles, w.c. fittings, galvanised iron tanks, stacks of firewood, and numerous other items.

On view day before and morning of sale; and catalogues may be had at the Place of Sale; and of the Auctioneers, 4, High Street, Croydon. Tel.: 122 Croydon.

TO ARCHITECTS, BUILDERS AND OTHERS.

MESSRS. JONES, LANG AND CO., of 3, King Street, Cheapside, London, E.C., have the following Building Sites for disposal:—

1.—By order of the Trustees of the London Parochial Charities.—A very important site, having an area of 6,400 feet super, situate in Garlick Hill, Queen Victoria Street, City, with two frontages, well adapted for the erection of several modern warehouses.

2.—By order of Trustees.—Nos. 131-134a, Great Suffolk Street, Borough High Street, S.E.; to be let on 99 years' lease, or to be sold, a Freehold Property, having a ground area of about 13,250 feet super, suitable for the erection of commodious warehouses.

3.—City of London.—By order of the St. Bartholomew's Hospital.—A central Building Site, Nos. 9 and 10, Monkwell Street, close to Wood Street; area 1,400ft. super.

For plans and full particulars apply to Messrs. Jones, Lang and Co., No. 3, King Street, Cheapside, London, E.C. Telephone: 830 Central.

Contracts Open.

TO BUILDERS.

CHURCH HOUSE, PAULTON, NEAR BRISTOL.

The Building Committee invite TENDERS from responsible builders for the erection of the abovementioned Building.

Builders desirous of tendering should, before the 31st inst., send their names to the Rev. S. Hebert, The Vicarage, Paulton. Plans and specifications may be seen at the Rev. S. Hebert's or Messrs. Melhuish and Sons, Paulton, on and after February 4th. Bills of quantities may be obtained on payment of a fee of one guinea (which will be returned to persons sending in a bona-fide tender in accordance with the conditions), Sealed tenders, duly endorsed, are to be delivered to the Rev. S. Hebert before 12 noon, February 19. The committee give no pledge to accept the lowest or any tender, and in the event of the number of applications being numerous, eleven will be selected from among them.

Paulton, January 15, 1910.

Owing to pressure on our advertisement space we are obliged to hold over the Employment Register till next week.

February 9, 1910. Volume 31, No. 784.

THE BUILDERS' JOURNAL

AND ARCHITECTURAL ENGINEER.

This Issue contains articles of special interest to Builders and Contractors.

Caxton House, **Westminster.**

L.C.C.'s Coming of Age.

The "coming of age" of the London County Council has been allowed to pass almost unnoticed, probably because the public were so completely absorbed in calculating majorities of a momentarily more interesting character. Thus an occasion has been lost of studying at length and at leisure the history of "the highest unit of local government." The Council would have done well to issue a carefully compiled history of what it has achieved during its twenty-one years of existence. Such an account, distributed in pamphlet form, would afford a valuable contribution towards the much-needed education of the citizen in his rights and duties, and it would not be destitute of importance for the more earnest student of civics, whom it would furnish with an instructive record of the use that the Council has made of its enormous powers, and, inferentially, of the extent to which those powers may have been maladministered. A matter-of-fact chronicle of acts and deeds would be particularly welcome, because it would enable the public to see the Council as it really is, and not as the distorting mirrors of rival political newspapers represent it to be. Although the Council is apparently so young—it was, of course, one of the so-called creations of the Local Government Act of 1888—its genesis may be traced at least as far back as the Act of Queen Elizabeth forbidding any further increase of buildings in London. The Council may be said to be in the direct line of descent from the Commission of Sewers appointed in the reign of Henry VI., on through the enactment of 3 James I., 1605, which extended the Commission's area of jurisdiction and down through the further Extension Acts of 1807 and 1837, and the formation, in 1856, of the Metropolitan Board of Works, which was the immediate precursor of the London County Council. It is remarkable that, in three hundred years, only these three bodies—the Commission of Sewers, the Metropolitan Board of Works, and the London County Council—have been directly responsible for the health and comity of London, and that, in a few years of strenuous activity, the Council should have done vastly more work than was accomplished in the centuries of more or less lax London government to which it was the heir. The Metropolitan Board of Works had been called upon to cope with extraordinary difficulties. As Mr. G. Lawrence Gomme pointed out many years ago, the growth of London prior to about 1850 had been gradual and normal. Then, owing largely to railway development, there came a period of tremendous expansion. To state the matter simply, the Metropolitan Board of Works had to provide for the sanitary well-being of a sudden and enormous increase of population; and on the whole the Board did splendid work, which has been unjustly discounted through the indignation aroused by the scandals created during its latter years by a few unworthy members. As for the Council, the most bitter of partisans will not deny that on the whole it has done a noble work for London. Its main fault has been that it has attempted too much, and that, in particular, it has been badly bitten by the craze for municipal trading, its rather desperate adventures in building and brickmaking, and its somewhat arbitrary enforcement of stringent building restrictions, being rather bad blots on an otherwise honourable history. These faults, however, were sternly checked at the last election. It is well that undue exuberance and extravagance should be curbed; but to be quite frank and impartial, the chief danger seems now to be that the Council may lapse into the opposite extreme, and become slothful and unenterprising. This also is a tendency that must be discouraged, for it is not to the interests either of the general community or of the builder that works should languish, but only that they should fall into the right hands.

Another Triple Alliance.

An optimistic leaderette in the "Globe" prophesies smooth things for the architect. After observing—perhaps with more truth than we should like to confess—that "the mass of the building which is now done in this country [why this insular exclusiveness?] knows no architect, and is subject to no laws" (which is obviously an excerpt from Mr. Ernest George's admirable address to R.I.B.A. students), our contemporary repeats Mr. George's very cheering assurance that "the idea of town-planning, which is comparatively new to us, is bringing an appreciation of architecture for smaller houses; it is inculcating the knowledge that a man must work, not only on his own plot, but must consider also his neighbour, combining with him for a pleasant lay-out and an harmonious grouping of buildings." Here the validity of the present tense is perhaps questionable, though it certainly adds vividness to the rosy-tinted prospect. Certainly, the Town Planning Act may be confidently assumed to imply very much more than increased salubrity and a more convenient lay-out. "In future, perhaps," our contemporary, adds, still echoing Mr. George, "the speculating builder, and the lawyer who finds the money for him, will realise the architect's help in improving the plan, so that some pleasant proportion may be given to the building, and some semblance of recognised style, while saving the present outlay on lavish and misplaced ornament." That last clause is surely a little bit wild, both as to its substance and its syntax; and the vision conjured up of the architect with the speculating builder at one elbow, and the money-lending lawyer on the other, is certainly not rich in æsthetic promise. There can be but little doubt, however, of the truth of the President's casual observation—that, as we could not fail to perceive and did not neglect to point out at the very inception of the Town Planning Bill, that measure, rightly administered, must bring greatly increased opportunities for the architect; and, incidentally, its operation may be found to emphasize the need for copyright in architecture.

The Extinction of the Genius Loci.

The contention that a building ought to grow out of the soil on which it stands has found its logical complement in the claim that the architect and the artificers ought also to be natives. But perhaps we have mistaken the gist of the following passage: "If there had been any life in the art schools of these great cities, like Leeds, Bradford, Liverpool, and Birmingham, the cities would have grown up quite differently; but in order to justify the greatness of their city and their own taste, whenever any important work is to be done, of course the London architect and the London painter are used, so that the one opportunity of having a living spirit in anything is lost. To take an instance—I went over the art school of Birmingham University. You have a great London architect designing a building entirely on paper, and the work is put into the hands of contractors who carry out the paper designs. Suppose you had a living school of architects in Birmingham and they had been invited to submit designs, had worked in co-operation with the fine local artists who exist there, and that they for the glory of their own city had all put their heads together and had produced a certain form of building and a certain form of art which would have a real con-

nection with the spirit of Birmingham itself. Then perhaps the art master in the municipal school could have said to the students, 'Such and such a building is to be erected. There will be an opportunity for those of you who have shown yourselves efficient to help in its construction by designs for fittings and decorations.' The University would then have been a monument of Birmingham culture at a certain date." Alas! poor Birmingham! Like many another town, it is doomed to lose its local characteristics and its native dialect, and to become cosmopolitan. The railways, the motor cars, the open competition system, and other malign forces of modern civilisation, have been too much for it; and the Town Planning Act will finish the deadly work. We deeply sympathise. Also we are sorry for the extinction of the dodo, and for the general obsolescence of home-knit stockings and home-made bread. But we bow to the inevitable with the best grace we can command. We demur, however, to the unjust expression "Entirely on paper."

Our Unspiritual Art.

It has been discovered and revealed to us that religious art in Europe is, as compared with the religious art of the Far East, unspiritual. Mr. Bernard Berenson has said it in a new book, and Mr. Lawrence Binyon has supported this opinion in the markedly spiritual columns of the "Saturday Review." While China and Japan come close to the utmost limits of what visual art can do to evoke spirit, one School alone, the Sienese, has an instinctive affinity with those Oriental Schools. Most European designs, it appears, are of architectural character; "the triumphs of European painting rest upon the power of modelling, of representing the power of communicating a sense of mass, weight, and bodily vigour." That is obviously true; and it seems to confirm two favourite contentions of a certain school of architects—namely, that a picture is a subordinate feature of a building, and that preferably it should be cut in high or low relief, if not in the round! It would remain unspiritual; but, alas! we barbarous Westerners would as a rule most willingly barter all the spirituality for a very small modicum of the sense of "mass, weight, and bodily vigour." It is perhaps for this reason that Gothic is going out of fashion, and that the recent strenuous endeavours to interest us in the architecture of India have failed to excite any appreciable degree of enthusiasm.

The Secret of Stonehenge.

Of the many attempts to solve the mystery of Stonehenge, that made by Mr. Charles F. Cooksey, in the current number of "The Nineteenth Century," is certainly one of the most interesting. The author is of those who believe in the existence in these islands of a prehistoric civilisation. Personal observation has convinced him "that, prior to the Roman invasion, there was a literature, a civilisation with settled laws, a knowledge of art, a large and well-directed army, commanded by men of very superior intellect and resource, and who for at least five hundred years maintained a not entirely unsuccessful resistance to Rome itself." He found, for instance, that the Roman city of Silchester was placed on the ruins of an earlier Celtic one, the remains of the houses of which were constructed with a knowledge of the art of building little inferior to that of their Roman successors. He thinks that the chivalrous King Arthur was no mere myth, but was perhaps identical with Caractacus. The "Kingdom of Ure" of Malory's romance he connects with the Eurovicians, a Belgo-Gallic tribe, who had the ancient city of Evreux as their capital, and who were among the earliest to make a settlement in Southern Britain. The author then looked for place-names that might be traced to these people, and found them in the Isle of Wight, as Yarmouth, Ewerland, and even Carisbrooke (?Caer Euroc). At Arreton Down he sees the Hill of Arre in the land of Ure, thus confuting the statement of Geoffry of Monmouth and Walter de Mapes that the Stonehenge relics came from "The Mountain of Killara in Ireland." At Arreton he discovered what he takes to be a large religious ring comparable to that of Stonehenge; and he unearthed traces of an old road leading from the ring towards Newport. The inference is, then, that the stones were removed from Arreton Down to Stonehenge; but how did they get to Arreton Down? and whence came they? Mr. Cooksey has traced them to a hill called Le Platon, in Bolbec, a few miles inland on the north bank of the Seine, where he found a curious old quarry from which he brought specimens of stone, one of which he says has been pronounced by expert geologists to have many points of similarity to the sarsens of Stonehenge.

Is Fresh Air a Failure?

In a report issued by the Board of Education on the Medical Inspection of Schools, the Chief Medical Officer, Dr. George Newman, notices that the greater number of the school medical officers have given careful attention to the very important subject of ventilation. In cases where it is found that ventilation is defective, the fault arises from one or both of two causes: (a) inadequate or defective means of ventilation, and (b) failure to take full advantage of the means of ventilation. Dr. Oliver, of Maidstone, found air in different rooms of one school yielding amounts of CO_2 varying from 8 to 21 parts per 10,000; Dr. Clements, of Batley, found that in two schools the impurity amounted to 9 to 15 parts; while Dr. Williams, of Sheffield, reports for three schools, 6.8 to 11.8 of CO_2 per 10,000; the fresh-air standard admitting but 4 parts. There are, of course, various reasons for neglect to use the means of ventilation. Some ventilators are improperly situated, and some teachers are supersentitive to draughts. In the latter case, the teacher's idiosyncrasy should not be lightly dismissed. The hardy disciples of that robustious school of thought which affects to believe that fresh air can never be otherwise than wholesome, may be led to abate somewhat of its enthusiasm in view of a recent report on the health of London County Council employees. It has been found that the health of the Council's sewermen is actually and considerably better than that of its park-keepers. The latter should get fresh air enough, in all conscience; yet it is found that they are peculiarly apt to suffer from tubercular complaints. Why? It is tentatively conjectured that, the parks being naturally much resorted to by consumptive persons, the ground becomes infected, and the bacilli are blown up with the dust and inhaled by the park-keepers. That may be one reason; but another considerable factor, it seems to us, is the lowering of the vitality, and hence of the power of resisting disease, of the men who are compelled to be out in all weathers. This is a condition that may apply to ill-ventilated—or over-ventilated—schools.

R.I.B.A.

At the general meeting on Monday, January 31, Mr. Ernest George, A.R.A., delivered his address to the students. He said:—

By established custom I address the junior members of our craft, those who have the inestimable gift of youth, and who will be filling the seats of their elders, I trust with benefit to the community.

Last year I gave my own experiences and expressed such views as I had arrived at, experience often showing what not to do again. Yet, if we in life could be allowed a second innings, probably we might not do more wisely. It is the common lot to work, and it is a matter of the first importance that your work should be that which interests you. Instinct and inclination may be taken as guides in your general direction.

I trust you have chosen the study of Architecture because it is attractive to you. It would be dull work for you, and the results would be deadly dull, if you took to the artist's career as you would to brewing or baking, with the humble aim of making an income. The latter is rather illusory and unsubstantial, and when it comes is the result of much hard work, in which the artist finds his pleasure, but which would be drudgery to the unillumined soul.

Architecture an Exacting Mistress.

I assume, then, that you are each conscious of the divine fire; it remains with you to see that it burns clear. To this end earnest application is necessary; and a thorough education both in science and art as well as in wider fields of knowledge. You will be called upon to make sacrifices and to relinquish some of the amusements and harmless frivolities of youth if you are faithful to your art; your pleasure must be in serving that exacting mistress.

Architecture is associated with every condition of man, and it should find appropriate use either for the temple or the tavern. The problems that will come before you are endless, giving constant variety to the work. There will be no time for idling. A painter may desist from his work awaiting inspiration; the architect, when grounded for lack of matter, may turn from composition to the many practical details that his occupation demands. He must recognise that he is a man of business, with grave responsibilities to his client; he must not pose as the brilliant genius, above mundane affairs. He must cultivate methodical habits and exactness.

In the Schools or in the office you will find young men sharing your pursuits and aims; and among them may be good companions and friends. Seek the society of fellow artists of all kinds; be they painters, sculptors, or craftsmen, it will be a mutual advantage. You will still have time to spare for the outer world, where you must not be unseen or unknown; it is there you find the client who gives you the chance of beautifying the world.

Cultivate Tact

in the treatment of the client when you get him; consider things from his point of view, his doubts and anxieties, financial and other, when starting on an important building enterprise. You probably know better than he does what he wants, or what he ought to want; do not vaunt that knowledge, but let your scheme seem to emanate from him. The plain man may tell you he "knows what he likes," and he possibly likes what is abominable; do not tell him so, he will be converted by degrees to like what is good. You cannot have all your own way, and your pet schemes may often be frustrated. After all, it is not your house that you build, though you are allowed the fun of shaping it. I have spoken of the natural man, the untutored, but I must acknowledge having worked for those whose refined tastes and judgment have been an unqualified advantage to the architect and to the building.

Education and Cultivation

of the mind should be always going on. Read much, and think much, and primarily make

careful study of noble buildings; see why they impress you; measure, plot, and sketch them. Cultivate observation and memory, so that these fine things remain with you; they will influence your work for good when you think to be drawing upon your inner consciousness.

The things that Solomon knew are nothing to the catalogue of details that you are expected to grasp It behoves you to know the history of architecture and to follow it through its many phases. It is well to be familiar with the literature of our art—the splendid books that have been produced in past times and in various languages. It is much to your advantage to have the command of foreign tongues. Indeed there is no branch of culture that is not a valuable asset in shaping the accomplished architect. I trust that you are gaining all the time a knowledge of construction, the paramount essential in the curriculum. Use every opportunity of visiting works in progress, builders' workshops and masons' yards; if also your hand can acquire some skill in any of the trades, it is all for your good. The limits of time and the shortness of life must be taken into account in making choice of subjects to be mastered.

Drawing.

I think we all accept the fact that sound training is necessary. First and foremost, acquire the art of drawing; it is the language in which your ideas must be told. Whether you are to be an architect or a landscape painter, drawing is best learned by the study of the figure from life or from the cast; it is the best training for the eye, demanding accuracy and judgment. The hand and the mind should learn to work together, evolving schemes or forms, and feeling for that which is best.

Avoiding all tricks, acquire a pleasant manner of drawing, one that makes your building presentable; for I have seen fair composition so expressed as to look forbidding—perhaps with capitals, mouldings, and carving put in with a heavy hand, such detail making dark splotches of those parts which would be the high lights of the building

But drawing has generally received its full meed of attention, and the greater danger is of regarding it as an end instead of a means. We have known such facility acquired that the hand has moved in advance of the mind—a fluency that speaks before thinking what is best to say. There is also drawing so pretty in its technique as to give fictitious attraction to a bad design.

The prizes we have the pleasure of giving to-night are for studies and compositions in some of which the drawing is, in my opinion, nearly as good as possible.

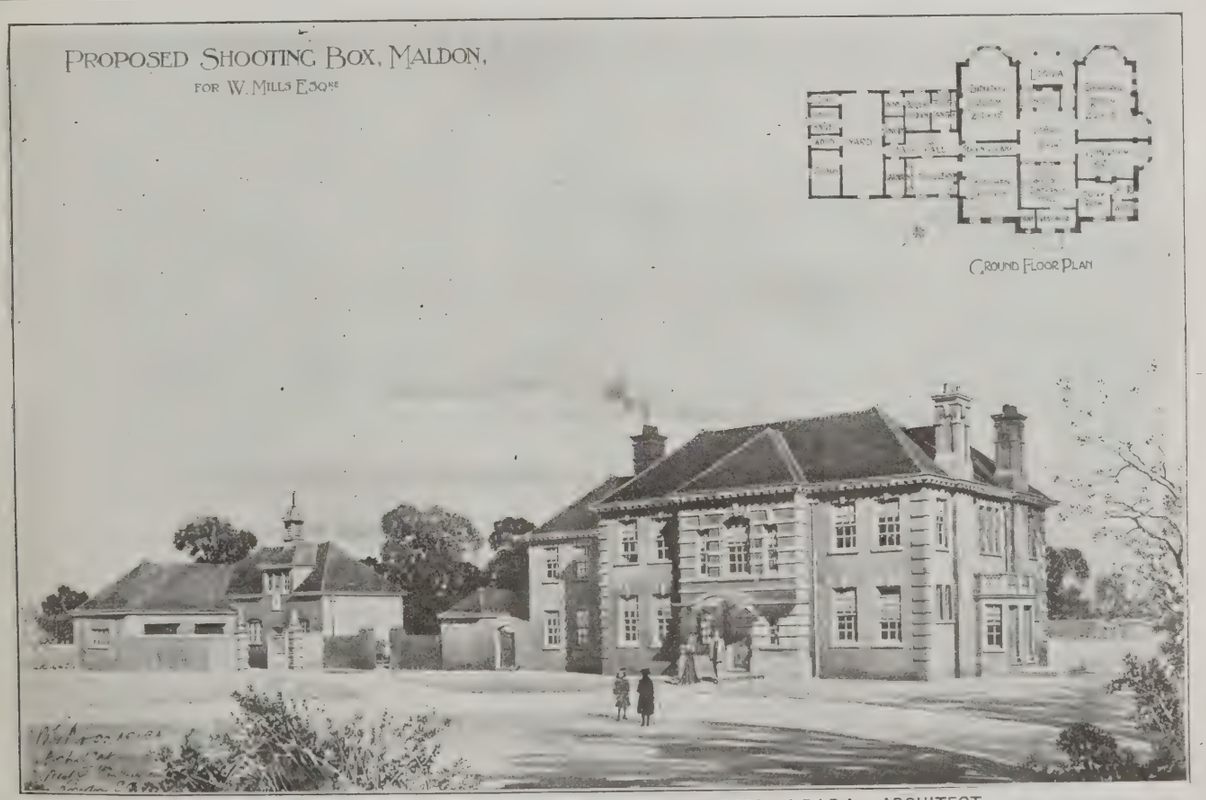
Archæology

will enter into your historical studies, but let it not be a matter of dry bones with you; do not follow it too far, troubling yourself with curious or unprofitable speculations; do not become the pedant. You should be conversant with the great achievements of all periods, yet I think the mind should be occupied with one method of building, of construction, and of treatment at a time. While examining the refinements and subtleties of Greek art and following on through the works of the great Roman builders, it would be undesirable to distract the mind with the study of the Gothic shrines, the soaring towers and spires of the North; they have their origin in another inspiration, another conception of the beautiful. There is the glory of dazzling light in the one case; while solemnity and mystery are the aim of the dim vaulted aisles of the mediæval sanctuary.

With all the striving after originality, I hope the rising architect will retain a reverence for Tradition. His best education is in the study of the fine work that his forerunners have done. As a change and recreation he has also the study of Nature, her laws, her methods, and her marvellous arrangements of colour. He must not, however, transplant the actual forms of verdure, chiselling them in stone, or using the fronds of ferns for metal castings.

Proportion

is perhaps the most essential element of good architecture. It costs nothing, and it is applicable to the humblest as well as to the noblest of works. How is it to be secured? It is the product of the trained mind and the practised eye. True, it has been reduced to a science, and there are lines laid down, with mathematical rules to be observed—rules that can be applied to the just proportion of length to breadth and height.



But the beauty of proportion comes in with every detail: with doors, windows, and their appropriate mouldings; and I think it can only be secured by a refinement of knowledge and taste—the subtlety of feeling that is indispensable to the production of fine music or painting. It is in a measure intuitive to the artist, but it is also a faculty for cultivation, and perhaps is gained most by the mental assimilation of great work.

Texture,

though secondary to proportion or shape, greatly affects the building; indeed, proportion is upset by over-large mouldings, keystones, or by sculpture in the wrong place, or to a wrong scale. The touches that should be the crowning glory of a work may, by ignorance, be made subversive to beauty. I must be forgiven for putting sculpture under the head of texture to the building, but as such it must be taken into account.

The sizes and jointing of stone courses are a factor in the matter of scale. We know the charm of small bricks, as seen in the Flemish buildings, and we admire the long thin brick in the Roman walls, while none can fail to be impressed by cyclopean stones as seen in the temple or in the bastions and walls that girdle an Etruscan city.

Smooth walls of ashlar stone or of gauged brickwork seem right with classic work and its delicate mouldings; while rough brickwork is in vogue for buildings of other types, some of our friends specifying that no mortar joint shall measure less than half an inch. The broken colour so obtained is pleasant,

PROPOSED SHOOTING BOX, MALDON, ESSEX. W. G. ROSS, A.R.I.B.A., ARCHITECT.

This house has been designed for a three-acre site on rising ground near Maldon Station. The site falls from the road, giving fine views from the back of the house, with the Blackwater in the distance. The best rooms are therefore placed on the garden front, with a south-east aspect. The accommodation is as shown with five good bedrooms on the first floor. The stables consist of two loose boxes, harness room, and double coach house, man's living-room, and hay and corn store on first floor. The elevations are in local sand-faced red bricks, with rubbed and gauged arches and Ancaster stone dressings. The cornice is of wood, and the roofs are covered with hand-made sand-faced dark tiles.

but the beauty of your work must not depend mainly on the accidents of texture and colour.

Colour.

What may be said of colour? It has an influence that appeals to us directly, for our happiness or distress; light and darkness are in its train. As a nation we are not colourists, and we have been shy of colour since the primitive Briton discontinued woad as a costume. Within the house there is the fear of losing light, while out of doors the feeling is that in our London streets all will presently be of the same low tone. There have been daring experiments with glazed materials, some with distinct success, but a shiny surface is not generally acceptable.

As a broad principle I think that raised surfaces and colour are seldom wanted together. A coffered ceiling or a good piece of modelling, with its projections well considered, does not want its background picked out with colour—its light and shade are an equivalent to colour; also a fine painted or mosaic ceiling is best as a flat or curved surface, or with only the slight projections of gesso.

We know that the Parthenon and other inimitable Greek monuments were originally in colour, the mouldings picked out, while the marble gods and goddesses were tinted in flesh tones, with coloured draperies. To me it seems that breadth would be exchanged for realism, the Greek masterpieces sharing the quality of waxwork; but I dare not question what was done by consummate artists of the great age.

In mediæval times the Gothic churches and castles had their shafts, ribs, and mouldings, in positive colours; the devices of heraldry supplying the *motif* of decoration, and the scheme, though vivid and crude, must have been splendid. The full glory of colour is found in fine stained glass, and that is at its best when throwing its tints on uncoloured walls. Walls of precious material or rich in decoration are best under the unobscured light of day.

Misplaced Ornament.

I will not talk to you of Styles, to advocate one or to disparage another: we have ceased to fight on that field. I will only say that the qualities making for good or bad are, in all styles, the same—viz., truth of construction, justness of proportion, breadth and simplicity, and above all simplicity. All the tawdry vulgarities that shock you are the violation of that quality: efforts after the pretentious or pompous; the assumption of something that is not. A building may be rich and yet broad in treatment; our Houses of Parliament may be taken as an example. The fascinating devices of Pugin give richness and texture to the whole surface, but they are so employed that the broad masses of Sir Charles Barry's composition only gain thereby. In contrast to this, the "Horse Guards," Whitehall, is a building severely plain, hardly a moulding to arches or openings, yet it gives almost an impression of richness by the proportion and disposition of the parts and the skill in arrangement of its lights and shadows. Misplaced ornament is the bane of architecture, as is also ornament that is out of scale.

We have touched upon the many things that it is good for you to know and to do; though you may be an Admirable Crichton, you will not accomplish all. You must make choice of that which comes best to you and for which you have affinity. In some cases combination meets the many requirements of the architect, who must play the parts of artist and man of business. If any two of you, quite sure of one another, agree thus to divide the work, it may be for your mutual happiness. The work will be done with fewer disturbing interruptions, and you will have companionship to lighten the worries that must arrive from time to time.

Simplicity in Life.

I have said study simplicity in design; I would further urge simplicity of life. Let your wants and your encumbrances be few, that you may be free in the race. Concentration of mind and of aim is essential if you are to be successful. I mean real success, which is not always to be measured by income. Comfort, cushioned ease, and expensive cigars are not a stimulus to the artist; discipline he needs, and the best form is self-discipline.

Live by Your Art.

I have before expressed my belief that it is well you should have to live by your art. It is good for you personally, and I think it is also good for the work. An architect has no opportunity of producing pot-boilers even when money is scarce. I do not know how many of you have been born with the traditional silver spoon in the mouth—I do not specially congratulate those who have. You have the harder fight against the spirit of indolence that is in us all. There is also the temptation to use the brains of others if you have them at command, to become mere dilettante, or, saddest, to become the art critic instead of the worker.

When sufficient knowledge and discrimination for the purpose have been attained by the student, foreign travel comes to him as an inspiration. With delight he will see in substance the monuments that have been familiar to him only in diagrams and text-books. There is joy in the freedom of life, and fascination in the change of scene, of climate, and of human interest. With these pleasant distractions discipline and application are specially called upon for the gathering of that which is precious and the refusal of all that is ephemeral or meretricious though attractive.

For those who are not privileged to make the grand tour there are priceless treasures to be found in our museums; doorways, fountains, monuments and bronzes of the great periods, and those now seen judiciously placed and well lighted in their spacious new home, accessible to all, and giving the student a quieter time for measuring and drawing than the traveller would obtain in a Continental street. These objects demonstrate the treatment and workmanship of the artist and craftsman, but much of their meaning is lost when these features are divorced from their natural surroundings. The student must look at things as a whole, noting the important element of scale; he must not be absorbed by details.

Over-crowding.

Our technical schools, State or rate aided, have been turning out batches of young men partially equipped for doing your work, and they will be provided from the public funds with drawing boards and T-squares for the purpose. Till they get outside the schools they do not learn, poor fellows, that the field is over-crowded and that we have no use for them; there is at the same time a great lack of good mechanics, a deficiency which they ought to supply.

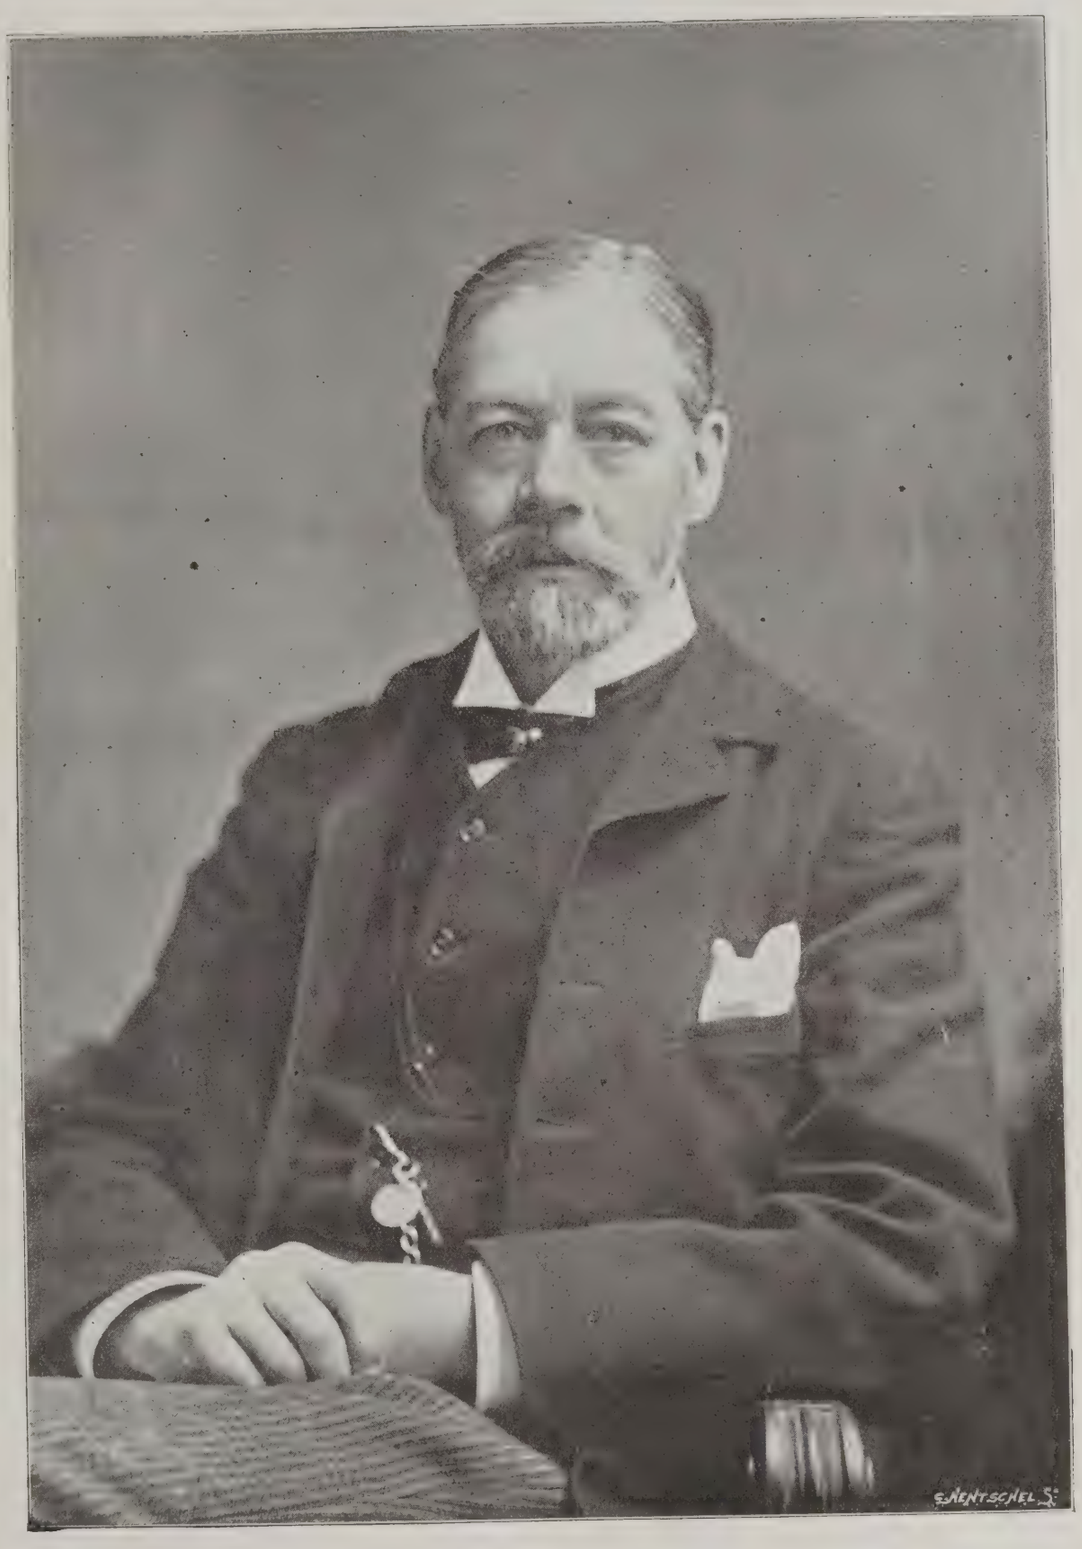
There is an effort among ourselves to raise the standard, both social and educational, of the practitioner, believing that thereby the quality of work will be raised. It will be only by the use of your higher endowments that you will keep the field. Our "art" teaching has been fraught with curious results, and I fear we have many bad artists who might have been fine craftsmen.

It is worth much to you to acquire literary style, your letters and reports being terse and clear of verbiage. The art of public speaking should be part of your equipment; you may take the advice as sound from one who lacks it. It will always be pleasant in this room to hear the voice of any young man who will add to the interest of the subject considered; he may often contribute profitably to the discussions. I speak of debating, not of bear-baiting. We have instances, fortunately rare, of young persons seeking prominence by the latter process; perhaps giving notice to "ask questions"—a string of them, pertinent or impertinent. Of all things avoid professional politics and cabals. They disturb that tranquillity which is essential to the performance of good work, while they occupy time that should be given to the claims of art.

In this Institute, our Brotherhood, our aim must be to help one another. We do not all meet with equal fortune; and if success comes to you, give a helping hand to your fellow who has less luck in the lottery. Fortune is a fickle dame, and none can tell which of you now entering the arena is to be the great architect of the future. The ranks are well filled, I will not say overcrowded; but for those of you who use your opportunities aright, who train seriously and possess your own souls, there will be work for your hands to do.

Speculative Building.

We are in the habit of judging the standard of architecture by the public or prominent buildings of the year, and by such pretty pictures as appear in the professional journals. It is painful, however, to remember that these are a very small portion of the building that is done in the country, the mass of which knows no architect and is subject to no laws. In the future we trust that the speculating builder, and the hard-headed lawyer who finds him the money, will realise the advantage of the architect's help to improve his plan, to give pleasant proportion to his building, and a semblance to some recognised style, while saving him his present outlay on lavish and misplaced ornament.



There is with us the beginning of an appreciation of architecture. There is the idea, comparatively new to us, called Town Planning; the knowledge that we must work not only on our own plot, but consider also our neighbour, combining with him for a pleasant lay-out, a monumental disposition, and grouping of buildings.

I verily believe, in the period that you enter upon, architecture will rise to a higher level than it has known in our day. I earnestly hope to achieve that end is the steadfast aim of you architects of the future. I wish you good luck, and a large store of happiness to be found in the work which it will be your privilege to do.

Mr. Mervyn E. Macartney then read his criticism of drawings submitted for the Institute prizes and studentships 1909-10 as follows:—

I feel deeply honoured in having been invited to review the works submitted for the Institute prizes and studentships. It is a privilege as well as an honour; but privileges, to be worth anything, are generally hedged round with duties, and so it is in this case. To discharge conscientiously this task is no light matter, especially for one, like myself, who has never entered any of these contests. I have never heard "the bells chime at midnight," nor have I racked my brain for recondite mottoes like "Touchsoane." There is this much to say for these competitions, that I firmly believe that they are awarded by the judges without fear or favour to the design or drawings considered best. I feel certain that your tribunal is absolutely impartial; and this fact must be of enormous value to you when entering these lists. It mitigates the soreness of defeat to know that you have lost because a better man has won. On the other hand, nothing discourages a man more than the feeling that he has been unjustly dealt with, especially when he is young and has not had any experience of the world's wicked ways. We should all be happy to stand in the shoes of the winners, and set out on our travels through the enticing lands which history points out as the birthplace of our Art—to Italy, to Greece, to France, or, less distant, to wander through our own land with all the blithe carelessness of youth, the enthusiasm, the whole-hearted devotion to Art. And to those who have failed I would say, you can at least hope to follow them later. Although your work in the present instance has proved unsuccessful, it will surely, by the experience, by the increase to your knowledge, help to make you cultivated architects. It will do that at the very least; it may also lead you to victory another time.

But, after all, the reward is his who has through months of self-denial carried to completion a definite and difficult piece of work. And the feelings of Gibbon on relinquishing his pen after his labours on "The Decline and Fall of the Roman Empire," are not

MR. THOMAS GRAHAM JACKSON, R.A., ROYAL GOLD MEDALLIST, 1910.

Mr. Jackson, who has been nominated as the recipient of the Royal Gold Medal this year, was born on December 31st, 1835. Educated at Brighton College, he entered, in 1854, Corpus Christi College, Oxford, and the same year he was elected Scholar, and ten years later Fellow, of Wadham College, Oxford. Mr. Jackson has always had a strong bent towards Gothic work—in which category, however, he includes much that is generally classed as Early Renaissance. As he himself puts it: "I regard all buildings which conform to the conditions of English climate, material, and habit, as Gothic." Mr. Jackson was a pupil of Sir Gilbert Scott, and his principal works have been new buildings at Oxford and Cambridge Universities.

very dissimilar to those of the weary student who lays down his pencil with his last drawing finished.

I may be allowed to say a word on the value of these competitions. As you all know, architectural education at the Beaux-Arts is almost entirely a matter of "concours," and those, too, of a magnitude that would make most of us grey-headed; but you also know with what results. The great American schools do no less, and their recent achievements are no less astonishing. There may be some disadvantages in this system of education, but they seem to me counterbalanced by its obvious advantages. Apart from the effect on the student of competing with his fellows, and learning from his blunders, and getting rid of all the nonsense he may have imbibed, it prepares him for the wider strife of his later life. Most public buildings nowadays are put to competition, and offer to the young man unequalled opportunities of displaying his ability. I may remind you, too, that it has nearly always been the same; you all know that Brunelleschi was unsuccessful in a certain competition for bronze gates, and lived to crown St. Mary-of-the-Flower with a great dome.

It is sometimes objected that these competitions are too academic in character, too much removed from everyday practice to be of much use to the student. From this view I entirely dissent. The exigencies and shifts of real practice will come soon enough, and these academic exercises, while teaching design, give to the intellect an agility to be acquired in no other way, and therefore I congratulate all students whose courage has successfully carried them through a long and arduous undertaking.

Two main branches of work have to be considered—studies of ancient building and original designs. Too much stress cannot be laid on the utility of the first of these studies. In no other way can the student learn to understand architecture as a thing of three dimensions—a thing solid and stable like the rocks and hills; a thing, like these, to stand through years and centuries exposed to the ravening teeth of time. This is one of the most useful lessons the student can learn—that architecture is not paper. By studying ancient buildings he will learn to understand the weights of architectural features, their values. If he analyses the impression made on his mind by a building, he will discover the qualities that made for sound architecture—repose, dignity, and unity. However much he is interested in detail, he will find that these are like notes of music—serving merely to build up some grand symphony of sound.

The greatest thinker of the eighteenth century, one whose mind like the very sun irradiated everything, likened architecture to "frozen music." I like this simile, for it seems to crystallise in two words all criticism of great architecture. And no one who has been moved and delighted by some fine building will, I think, be inclined to doubt its truth. So that the student should try to discover the vital qualities in the building he chooses to delineate, and pay more attention to the masses than to the details which only help to build up the main conception. In his drawing out he should endeavour to be as clear and concise as possible, trying to express the spirit of the work—as far as this can be done by geometrical drawing—rather than his own idiosyncrasies.

With the original designs, clear and simple draughting should be striven for. But this is secondary to the design, and the student, before entering this phase of his work should have made himself quite clear as to the requirements of the programme. From this brief premise let us pass to a short review of the work itself which has been submitted in the present instance.

The drawings as a whole are not of transcendent excellence. Indeed, I consider that, taking them *en masse*, they are below the average. There are some good examples of draughtsmanship and colour, but they are few. There is little unanimity in the rendering of drawings, which, by the way, adds considerably to the difficulty of judging, and points to the fact that there is at present no definite teaching in this country. There are almost as many styles of drawing as there are candidates. Some are in the French style, but they lag far behind the real thing; others are done in a slap-dash "Art Nouveau" with a Teutonic touch that is rather amusing.

9-13, ESSEX ROAD, ISLINGTON, N. LOVEGROVE AND PAPWORTH, ARCHITECTS.
The front of these premises having been cut off through a street widening scheme the new front shown in the illustration has been built from the designs of Messrs. Lovegrove and Papworth of 374-8, Old Street, E.C. for Messrs. C. F. Anderson & Co. The base is faced with salt glazed bricks and the upper part with fixed stocks with artificial stone dressings of a warm cream colour. The general Contractors were Messrs. R. Schooler & Son.

The good old-fashioned type has still its followers. Originality has a certain charm, and has the additional, questionable, advantage of attracting attention. This is notably the case in the design "Horseshoe," awarded the second prize in the Soane Medallion competition. But it would be impossible to live in the same house with that perspective.

Now, if one looks at the drawings collected at the Victoria and Albert Museum, one is struck by the sobriety and dignity of the exhibits. There is no attempt to advertise the cleverness of the draughtsman. It is good honest work, and attempts only to render truthfully what it set out to do without any *arrière pensée* of applause. It may be said here that this quiet unobtrusive draughting requires more skill and patience than the slap-dash method. Perhaps the extensive use of perspectives is the cause of this anxiety to shine. Personally I instinctively decline to be drawn by the alluring and meretricious. I should recommend students to leave out all unnecessary details, such as figures and motor-cars—the guardsman and nursemaid seem to have had their day, but other figures as ill-advised and as badly drawn have taken their place, which always remind me of the blind man's remark in the New Testament that "he saw men as trees walking," and as for the motors—no self-respecting inspector would give them a licence.

Taking the awards as they appear in the Institute Journal, we have the measured drawings first. The first prize is awarded to the author of a set drawings showing the Wellington monument, "Roma." The details are beautifully drawn, but the half-inch drawings are less attractive. They lack crispness and decision, but on the whole they make a useful set, although below the average of other years.

The drawings placed second, "François Mansart," are remarkably good. His subject is the Hotel Carnavalet, Paris, and if the large-scale drawings had been up to the standard of his small drawings, it would have come into more serious competition with the winner.

"Adige" was placed third, with drawings of the Palazzo Pompeii and Palazzo della Gran Guardia Vecchia, Verona, but his execution lacked crispness and did not rise to his high theme.

Two sets of the West Front of St. Paul's were submitted, both conscientiously drawn. Those by "Puggins" are extremely accurate, and I would impress on students the necessity for absolute correctness. Another set shows Christ Church, Spitalfields—a rather gaunt looking subject when shown in grim outline of black and white. This last competitor would be well advised to consult the conditions more closely in future. He will find that six strainers are required, and if his drawings had been adjudged the best, he would have been placed *hors concours*.

The next prize on the list—the Soane Medallion—is the most important, and although the subject of the competition was an inspiring one, it has not called forth any great merit. The fault lies to some extent in the conditions themselves, as perhaps the boundary of the site was too confined. However, the first two designs are good. The first, "Mirth," is a good sober study of Renaissance work, very well worked out, but indifferently drawn; a serious omission in the plan is the absence of a foyer. The perspective, however, does justice to the design; indeed, is it quite the best in the exhibition. The second, "Horseshoe," is an extremely clever design, but I fear in execution its crowning feature would be lost. Its clever perspective has been mentioned above. "Sunlight and Air" submits a design worked out with a French flavour. The effect in perspective is not quite happy. An imaginative study, cleverly rendered, is drawn by "L'Espoir." "Mafie's" drawings are extremely interesting, but the design fails as a whole. If it is allowed, I should recommend the author of "Budget" to retire quietly into political life.

Three sets of drawings were submitted for the Owen Jones Studentship, and the prize is awarded to Mr. W. O. Miller, whose work deserves great admiration, but it is regrettable that he did not choose a better illustration of modern work than the façade of the Church of SS. Pudentiæ and Pudentianæ at Rome, the front of which has been covered in modern fresco decoration in imitation of mosaic. I endorse the recommendation that the sets of strainers submitted by Mr. H. R. Wilkinson should have some award. Mr. Gibbons should be commended for the very painstaking and careful drawing he has made of the Italian mosaic pavement from the Presbytery of Westminster Abbey, especially as the whole was drawn and coloured on the spot.

The drawings submitted for the Pugin Prize are on the whole very good. Mr. Hubert Frazer, who is awarded the prize, has an excellent variety of drawings clearly and well done. The two gentlemen, Messrs. Chisholm and Cowper, bracketed for second place have also done good work.

Thirteen competitors submitted designs for the Tite Prize. There seems to have been some misconception in their minds as to the kind of loggie best suited to the site. Here, again, if we may say so, the conditions were faulty. One has only to consider the size of the sunk garden—actually about one tenth of the area of Lincoln's Inn Fields—to see this. In spite of this confined area the bulk of the competitors choose to shut it in with raised loggie, which in reality would have a poor crowded effect. None of the designs was considered to possess sufficient merit to warrant the prize being awarded, and it it therefore withheld. The most meritorious scheme, "Jupiter," offers no obstruction. The sunk space (it cannot be called a garden), is surrounded by a terrace raised a little above the level of the street, and the corners are marked by raised shelters—quite a needless addition. His drawing is only fairly good, and his perspective is bad. "Tomahawk," placed second, has no obstruction opposite the palace, although he has surrounded the other three sides with screens. The triumphal arches at the sides are too heavy and quite

out of place. "Comprized Within" is placed third, with a rather careless set of drawings. The perspective is the best of them. Most of these drawings are very much below the usual standard of the work in this competition.

Mr. C. D. Carus-Wilson is awarded the Arthur Cates Prize for some excellent drawings. His design for a country house is also good, at least as far as the exterior is concerned; the plan is poor. Mr. Wm. Dean is commended for his drawings of the staircase of Cromwell House, which are extremely vigorous and crisp.

The Grissell Gold Medal is awarded to "Fra Angelico" for a fairly good study of a church in ferro-concrete. This competitor is commended for his constructive ability. The architecture is of a nondescript and futile character, and the perspective distinctly poor. Mr. W. Milburn, junior, has been awarded the Godwin Bursary in view of the convincing nature of his essay and knowledge of hospital work.

In conclusion I should like to say one word more to students. I have said above that the task of the judges is made extremely difficult by the fact that the drawings are finished in every conceivable style—shadows projected on plan till the scheme is hidden, others coloured like a kaleidoscope, and elevations treated in a hundred different and confusing ways. I should recommend students to alter all this, to finish their drawings simply in pen and ink, and to figure titles, names of rooms, etc., in legible and fair Roman lettering. I hope to see this embodied as a definite requirement in the instructions to competitors in the future. When a perspective is required it is obviously useless to project shadows on elevation. Do not imagine that it is easy to make a fine set of drawings in pen and ink—far from it; but it is by far the clearest and best way of exposing a design.

Discussion.

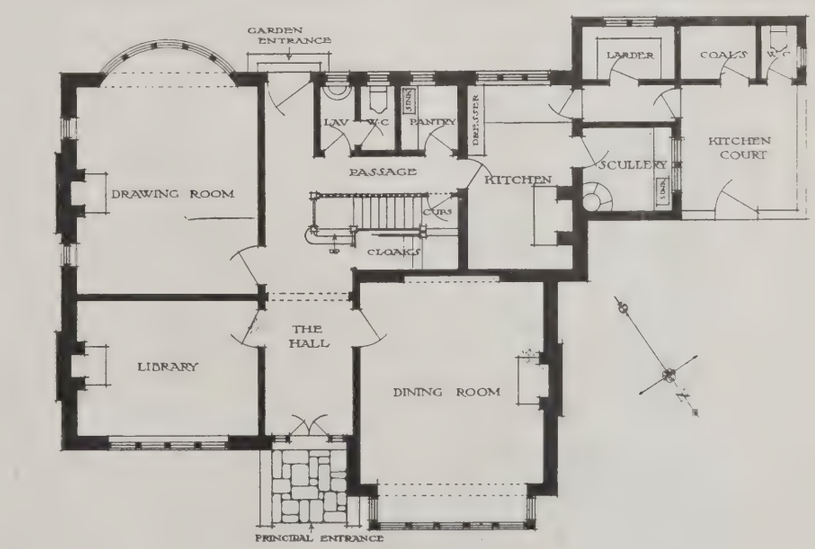
Mr. Reginald Blomfield, A.R.A., proposed a vote of thanks to Mr. Ernest George, and said he hoped that students would read and re-read his admirable address. Such shrewd advice, coming from one so experienced as Mr. George, might be taken as a sort of pilgrim's script. He had listened, he continued, with much interest to the criticism of work, read by Mr. Macartney, who was eminently fitted to criticise as one who enjoyed exceptional opportunities of studying at first hand that masterpiece which was the finest example of Renaissance work in England—probably in the world. The judges must have had considerable difficulty in allotting the prizes this year owing to the excellence of the work submitted, which he believed to be equal to that of previous years. The Soane and the Tite prizes were, he understood, to encourage design in the grand manner; but the very limited dimensions did not allow the student sufficient elbow room. The many and diverse methods of draughtsmanship were somewhat unsatisfactory, and he hoped that some day an advanced school of design would make an effort at standardisation of treatment. He would like to see the prizes extended right up to the hilt, for it was a matter of great satisfaction to find work, as they had seen at the Alpine Club, of such high promise. During the last two or three years there had been an abominable epidemic of Ionic capitals, from the volutes of which people were in the habit of hanging swags, until it had become perfectly nauseating. The custom came, as they knew, from France. He had been told recently that the Arts in France, and particularly Architecture, had become bankrupt, and no doubt there was some truth in the statement. The careful study of old work was the only way to form a manner of one's own. Exuberance of ornament suffocated beauty; and he advised architects young and old to rely on their brains and imagination, rather than on the camera and the sketch book.

Sir W. B. Richmond, K.C.B., R.A., seconded the vote of thanks, and congratulated the Royal Academy upon the election of Mr. Ernest George as an associate to its ranks. He sincerely hoped that the time would come when they would have more architects among them at the Academy. He recalled the fact that, many years ago, when he had gained a silver medal, Mr. George had received a gold one. He congratulated the author of the "Mistress Art" upon his speech, which was for him (Sir William) perhaps a tiny bit too Palladian. He entirely agreed with all the strictures that had been made upon him with respect to games. He was an old man now, but once he had been a devil at games. However, he would far sooner see the youth of the country making a Territorial Army, or a band of boy scouts than expending so much energy upon the useless game of football. Consultation with the daily paper would show about four inches of matter, perhaps less, dealing with educational subjects, and four columns about cricket in Australia or somewhere else. The address by Mr. Macartney was as full of meat as an egg. He himself had been preaching for years the same gospel at the Academy, but the difficulty was to get the young men to "catch on." Referring to the colouring of Greek architecture, Sir William said it was wrong to think that the Greeks applied the gaudy colours that we, and more especially Germany, would use. The marble walls of the Greek buildings were first covered with wax, so as to receive a delicate colour. If they examined the purest colouring in the Parthenon they would see something quite delicate, something quite unaggressive, like spring flowers. The buildings throughout Sicily had retained the exquisite colouring that had been applied, in some cases, so far back as the second century B.C. No blue had been used, only black and white, which in that climate had the appearance of blue. If colour was to tell at all in England it had to be crude. He maintained that architecture, however pure in itself, was not injured, and might be considerably influenced for good, by judicious colouring.

Societies' Reports.

The Institution of Civil Engineers.

At the ordinary meeting on Tuesday, the 1st February, the Council reported that they had recently transferred to the class of members, Messrs. G. Gonsalves and T. W. A. Hayward.



It was also reported that 24 candidates had been admitted as students, viz., H. Bächtold (Manchester); A. T. Bennett (Stroud, Glos.); C. W. Boyle (Leeds); G. M. Brown, B.Sc. (St. Andrews), (Seremban, F.M.S.); N. S. Clouston, B.A., B.A.I. (Dubl.), (Dublin); J. L. H. Cooper, B.A. (Dubl.), (Gateshead); S. Crowther (Leeds); A. S. Culham (Bury St. Edmunds); B. N. Dutta (Arbroath); E. W. Eller (London); K. Gauldie, B.Sc. (St. Andrews), (London); H. J. Gwyther (Manchester); W. L. Hamilton (Edinburgh); N. H. T. Homer (Swanage); D. F. Irving (Bristol); H. P. B. Jones (Southsea); E. C. Last (Garston); E. Mallett, B.Sc. (Eng.) (Lond.), (Southend-on-Sea); W. G. McCracken (Glasgow); B. L. St. C. Miller (Bristol); J. A. Rodwell (Leeds); R. V. W. Stock (London); A. F. Tippett (London); B. H. Witty, B.Eng. (Liverpool), (Liverpool).

The monthly ballot resulted in the election of:—

Nine members, viz., W. F. H. Creber (Sheffield); R. A. Fullerton (Glasgow); T. Glover (Norwich); S. Hunter (North Shields); E. H. Lloyd (Cairo); J. D. McLauchlan (Edinburgh); A. H. Roberts (Leith); H. Rowell (Newcastle-on-Tyne); W. J. Wilgus (New York).

26 Associate members, viz., R. J. Angus, Stud.Inst.C.E. (Calcutta); A. S. Barker, Stud.Inst.C.E. (Newcastle-on-Tyne); T. S. Brown, Stud.Inst.C.E. (London); H. Cockburn (Rio Tinto); W. E. Desbruslais (Nagrakata-Jalpaiguri, India); M. E. Y. Eliot (Standerton, Transvaal); P. N. Everett (Yeovil); D. Furness, Stud.Inst.C.E. (Poulton-le-Fylde); C. J. Gyde (Johannesburg); R. B. Higginson (Punjab); F. P. Khan, B.A. (Cantab.), (London); H. F. Mason, Stud.Inst.C.E. (London); T. Muirhead, B.Sc. (Glas.), Stud.Inst.C.E. (Glasgow); J. A. Orrell, Stud.Inst.C.E. (Bradford); D. Paterson (Singapore); A. Priestley, M.Sc. (Victoria), (London); H. I. Robinson, Stud.Inst.C.E. (Sevenoaks); H. Stringer, B.A. (Cantab.), (Nanking); E. M. Tabor (Eastbourne); H. Terrell, Stud.Inst.C.E. (Chittagong); A. Tomlinson, M.Sc. (Victoria), Stud.Inst.C.E. (Manchester); F. R. Unwala (Bombay); J. Warrack, B.Sc. (Glas.), (Manchester); T. W. Wishlade (London); J. W. Wooding, B.Sc. (Eng.) (Lond.), Stud.Inst.C.E. (London); H. R. Young (Dunedin).

Mr. Harry W. Weedon has moved his offices from 75, New Street, Birmingham, to more extensive chambers at 95, Colmore Row, Birmingham. Telephone, 7317 Central.

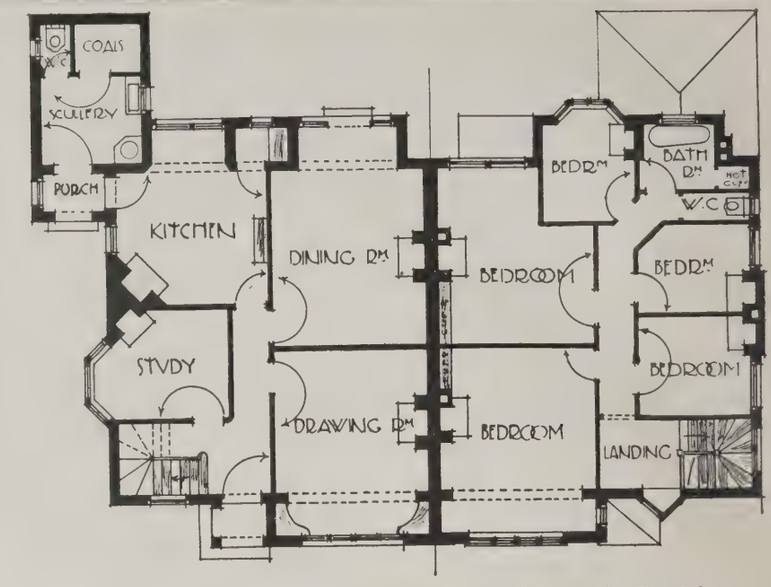
PROPOSED HOUSE AT GUILDFORD, SURREY. R. F. JOHNSTON, ARCHITECT. (See centre plate.)

Notes on Competitions.



LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Mar. 1.	GLAZED BRICKWORK DESIGNS AND ESSAYS. A committee of glazed brick manufacturers invite designs for works to be executed in glazed brickwork, also essays as to the advantages to be derived from the use of this material in accordance with conditions to be obtained from J. Johnston Green, 142, Liverpool Road South, Southport. Premiums of 100 guineas, 50 guineas and 25 guineas awarded to designs and essays jointly. Assessor Mr. Max Clarke, F.R.I.B.A., appointed by the President, R.I.B.A.
Mar. 31.	SHEFFIELD: ENDCLIFFE PARK CHURCH. Plans desired for Church for 650, Institute for 150, Primary Department for 125, Junior Department for 95, and Caretaker's Apartments. Premium, not merged in commission, £35. Assessor, Chas. Hadfield, Esq., F.R.I.B.A. Questions until February 10. Delivery on March 31. On receipt of 5s. the Secretary, J. W. Nicholls, 64, Everton Road, Brocco Bank Sheffield, will furnish conditions and instructions, with plan of site, showing existing buildings, levels and drainage—these not returnable. Deposit returned only to those who send plans.
May 31.	MUNICIPAL OFFICES, KARACHI. The Municipality offer a premium of 7,500 rupees (£500) for the best design, detailed plans and estimates for new Municipal Offices. Cost not to exceed 500,000 rupees, and the style of architecture is left open to the designers. Ferrotype plans of the site and a general arrangement of the floors of the building showing the accommodation to be provided, together with a copy of instructions to architects, will be supplied to intending competitors on application to the Chief Officer and Chief Engineer, Karachi Municipality. A charge of Rs. 5 will be made therefor, which will not be refunded. Each set of drawings must be sent in anonymously, but accompanied by a sealed envelope containing the author's name and address. Each set of drawings and all the documents required, including the sealed envelope, must be securely packed in a wooden box addressed as follows:—The Chief Officer and Chief Engineer, Karachi Municipality, Karachi, India, and forwarded, at the competitor's own risk and charges, in time to reach the Chief Officer on or before the 31st day of May, 1910. It is proposed to apply to Government for permission for one of the chief architects to act as assessor to decide on the design to which the prize shall be awarded. The decision of the assessor will be final and not be open to dispute. The decision of the Municipality will be made within three months of the latest date for submission of designs, and payment of one-half of the premium will be made thereafter to the author of the selected design, the balance to be paid when the further details specified in the instructions to architects have been supplied. On payment of the premium the Municipality will have all rights in the design, with power to erect the building under its own agency, either according to the design selected or with such additions or alterations as it may deem necessary.
No Date.	SECONDARY SCHOOL AT PETERBOROUGH, for Soke of Peterborough Education Authority, to accommodate 250 scholars, but allowing for enlargement so as to accommodate 300 scholars. Particulars of the general instructions and conditions, together with a plan of the site, may be obtained on application to Walter J. Deacon, Clerk to the Authority, Cross Street, Pteugh.

Elementary School, Southend-on-Sea.

In the local competition for an elementary school for 1,200 children recently promoted by the Southend-on-Sea Education Committee, the assessor was Mr. T. J. Bailey, F.R.I.B.A. The committee have now made the following awards based on his report:—1st permium, design under motto "XL. Alternate," by Mr. P. Brockbank; 2nd ditto, "Axial," by Mr. W. G. Ross, A.R.I.B.A.; 3rd ditto, "Education," by Mr. J. T. Greenhalgh.

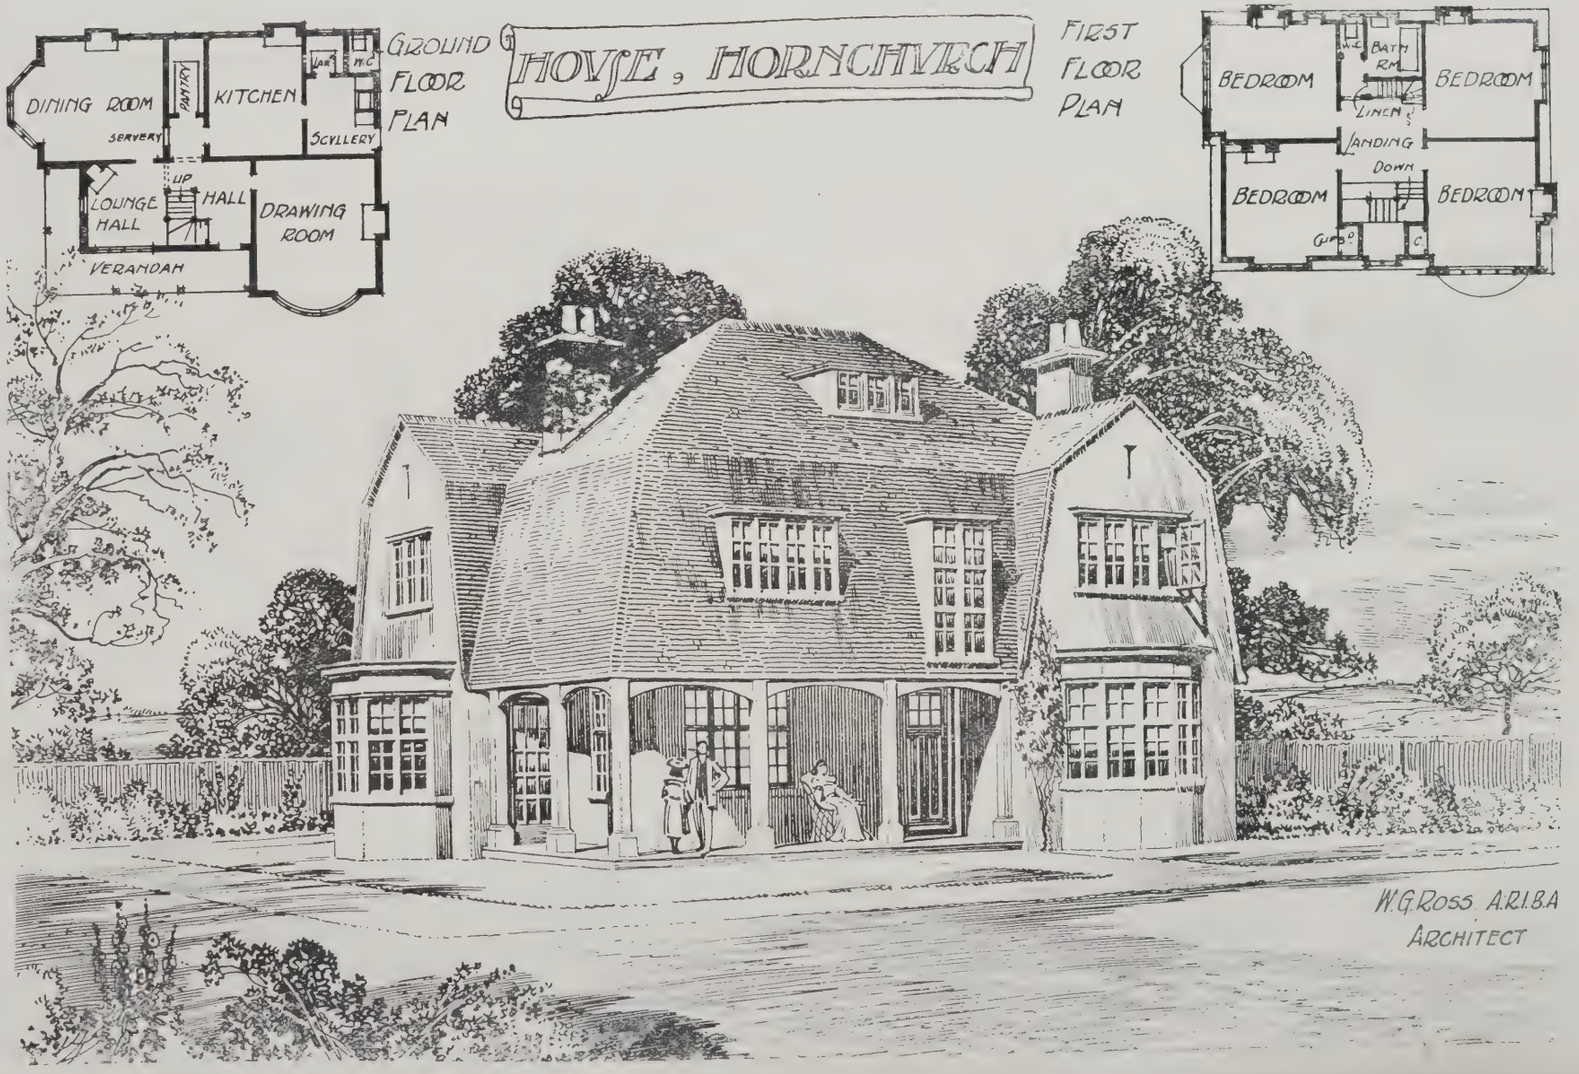
Competition: A Remedy for the Financial Loss to Architects.

To the Editor of THE BUILDERS' JOURNAL.



SIR,—I have read with interest Mr. Edward M. Gibbs's letter on the subject of Financial Loss to Architects Caused by Competitions, and at the moment at least am quite sympathetic (having made a design for the Museum of Wales, and finishing all of the drawings but one in time—but a day late with that one, sufficient cause for disqualification!— and hence am filing the work of two or three weeks away in the lumber room).

The point Mr. Gibbs has raised has already been studied in the United States, and the writer was interested to discover by means of personal observation that nearly two-thirds of the cost of a set of competitive drawings goes into the inking in of line drawings at ⅛in. scale; that by doubling the scale one very nearly doubles the cost of the drawing; that is to say, if a set of drawings at 1-32in. scale take ten days to produce (inked in), they will take about nineteen or twenty days to make at 1-16in. scale and, say, thirty-five days at ¼in. scale. This proportion of cost of pencil drawings with shadows cast and washed in is very much less, but, of course, requires much more skilful assistance than when ink is used. If a finished set of pencil and wash drawings at 1-32in. scale take ten days to complete, the same drawings at 1-16in. scale can be made in about thirteen days, and at ⅛in. scale in about fifteen to sixteen days. This analysis of time is the result of notes which have been made during the making of competition drawings by the writer, and upon twenty or more important competitions. One or two notes which the writer has in his note-book may be of general interest to architects entering competitions:—

On the L.C.C. Hall Competition, an expert draughtsman pencilled in one five-storey bay of a running motif in Mr. Belcher's design in 22 minutes, and inked it in in 50 minutes. By making careful note of the time spent in the various moves made by the draughtsman, I found that twenty minutes were spent in actual drawing of lines, six minutes in adjusting T-square and set-square (the design included fluting columns), and most of the remainder in trying the pen, filling it, cleaning it, and reaching for the ink bottle; four minutes were spent using an ink-eraser. On the same competition—towards the end—I kept track of erasures (by noting the sound, of five men working in the same room) and found it to be almost continuous during three hours, and at times two or three men were erasing at once. I also noted that about four out of five errors were made by the students or young draughtsmen, while one of the best men drew for three successive evenings without using knife or ink-eraser.

Generally, it will be found that it does not pay to employ students upon competitive drawings unless exceptionally skilful at lettering, and with sufficient experience with plans to be trusted with inking in. If the drawings are to be in pencil and wash, the architect can execute most of them himself, or with the help of one or two good assistants upon duplicating, and a student to help generally in the way of service rather than upon the drawings.

In the competition for the big groups of buildings for West Point Military Academy, Mr. W. S. Eames, of Eames and Young, of St. Louis, wrote to each of the twelve invited competitors (probably the twelve most prominent offices in the United States), and asked them to state the cost of their drawings. The average cost was found to be about $3,000 each set. The lowest cost was given by Messrs. Cram, Goodhue and Fergusson—the successful competitors—who stated that most of the drawings were made by Messrs. Cram and Goodhue, but assistance in finishing cost about $1,800. Messrs. Eames and Young's design cost about $2,600, and was executed almost entirely by six very skilled and high-priced assistants. In some of the offices employing their regular draughtsmen of all grades of ability, the cost varied from $3,000 to $4,000. Mr. Burnham's fine drawings, which were inked in with light ink before rendering, were reported as costing about $5,000. The actual cost of the twelve sets was somewhere between $25,000 and $40,000. The deductions which I make are these: First, that inking in ought not to be required; second, that in an open competition the drawings should be at a very small scale, and as few as possible; third—which would result from the foregoing—the drawings should be made by the architect himself, and with the assistance only of men as competent as himself. Perspectives should be prohibited unless it is thought proper for the designs to be plainly signed.

W.G. ROSS A.R.I.B.A
ARCHITECT

PROPOSED HOUSE AT GUILDFORD SURREY
FOR W. STUART MURRAY ESQUIRE
R. F JOHNSTON ARCHITECT
R.F. JOHNSTON
DELT 1909

As to competitions in general they ought to be conducted not for the purpose of securing a design, to which the architect is bound to adhere, but for the purpose of selecting an architect whose ability to execute a given problem should be indicated by the *parti pris* in the design which he submits. There is too great a tendency, in England especially, to consider the architect as a kind of skilled draughtsman and guarantor of what the builder's price will be, and to employ him as the servant rather than as the professional and artistic adviser of the owner. "Conditions" of competition ought to be discountenanced by the architectural societies, and a "programme" of competition substituted. The architect selected ought not to be limited to produce exactly what he submitted in the competition or to be in danger of losing the commission if he makes an error in his estimate.

From my observations of competitions I am led to believe that the best results practically and artistically are obtained when the duties of the assessor are reduced to a minimum, when the requirements of the client are stated in general terms, and the approximate price only, exclusive of ornament, is given, and when the architect selected can modify his detail at will after selection. To this end a mixed and double competition would give the best results—that is to say, by having a competition open to all, but with a dozen of the best men invited and paid, for a period of one month, and requiring drawings at a scale sufficiently small so that they could each be placed on a sheet of, say, half-imperial size. From the designs entered in the first competition, in which every competitor should be obliged to take part and enter, on an equal footing in other respects than that of invitation and payment to a few, from two or three to a dozen might be selected to enter upon a more detailed set of drawings; but even these should not admit of too much detailing, and if fine pencil drawings were required, 1-16th inch (or 1-8th inch in very small structures) scale should be sufficient for the purposes of the assessor.

There may be some objections to the above suggestions—possibly from the draughtsmen who draw lines which look like shoe-strings—but I put them forward as leading in the direction of improved status of the profession, and as a means to cutting down the drain on its financial resources.

FRANCIS S. SWALES.

Notes and News.

In a series of experiments to determine whether concrete could be conveyed in the plastic condition from the place of mixing to the point where it was to be deposited, Messrs. Buzzell and Larkin have, according to "Science Siftings," attained results which seem to determine the feasibility of this plan. The experimental plant consisted of a hopper tank maintained under compressed air, in which the concrete was placed, and from which a pipe led to the point of deposit. Half a cubic yard of broken stone concrete was deposited at the end of 400ft. of 4-in. pipe in less than five seconds. One must not forget that Mr. Edison also claims to have devised a liquid concrete for making his "poured" or moulded houses.

* * *

The Chain Concrete Syndicate, of 1, Basinghall Square, Leeds, and Carlton House, Castleford, recently issued a pamphlet on their system of reinforced concrete, which consists in great part of a description of an interesting example of reinforced concrete, viz., the construction of an underground lavatory at Bridlington, and a reprint of the article descriptive of the system which was published in our columns some time ago. The pamphlet is worthy of perusal by all those specially interested in the subject.

One of the largest stones ever cut in Britain is a block of granite brought from Polkanuggo Quarry, Cornwall, to form the foundation stone of the sill of the new west entrance at the North Eastern Railway Co.'s docks at West Hartlepool.

* * *

Our Plate.

Proposed House at Guildford, Surrey.

The site proposed for this house has a south-easterly aspect, and is surrounded by some fine old trees. The rooms are of convenient size, the drawing room having a semicircular French window leading to the garden. The servants' quarters have been kept well away from the rest of the house, with suitable access to the dining room from the kitchen. Special thought has been given to the cupboards, pantry and linen-cupboard. There are, four bedrooms, dressing-room, bathroom, etc., w.c., box-room, and servants' bedroom, on the first floor. The hall is panelled in oak to a height of 7ft. The roof is covered with hand-made and sand-faced roofing tiles. The walls are rough-cast; the chimneys being built of small hand-made red bricks. The garden lies south and east. The architect is Mr. Robert F. Johnston, of London.

House at Hornchurch.

This house is built on a corner plot on the Great Nelmes Estate. The accommodation is as shown with one bedroom in the upper roof. The dining-room fireplace is recessed in an ingle fitted with seats. The walls externally are cement rendered, rough cast and distempered cream colour. The roofs are covered with Tuckers hand-made sand-faced tiles. The windows are glazed with leaded glass, and the opening lights are fitted with metal casements and slips. The woodwork externally is painted apple green. Mr. Walter Gray Ross, A.R.I.B.A., of 1, West Street, Finsbury Circus, E.C., is the architect.

A PAIR OF HOUSES AT FINCHLEY.

This drawing shows a perspective view of a pair of houses recently erected on the Finchley Manor Estate. These have been built with brickwork, roughcasted externally on all elevations. The roofs are of red tiles, the entrance halls and staircases have old panelled dadoes, and the windows are filled with leaded glass of artistic and simple pattern. The builders were Messrs. Frecker and Co., and the Architects Messrs. Rosser and Annan, of Sheen, S.W.

HOW THE LABOUR EXCHANGES WILL WORK.

By W. H. Beveridge, Director of the National Labour Exchanges.

At the annual general meeting of the National Federation of Building Trades Employers of Great Britain and Ireland, held at the Trocadero Restaurant, Piccadilly Circus, London, on January 26, the President (Mr. Ernest J. Brown) introduced Mr. Beveridge, of the Board of Trade, who had kindly consented to explain the working of the Labour Exchanges, of which he is at the head.

A National System.

An Act was passed last year, he said, authorising the Board of Trade to establish and maintain a national system of labour exchanges, to which employers wanting workpeople of any kind might send and notify their needs, and at which workpeople, when in search of employment, might register with a view to hearing of any vacancies notified. Since the passing of that Act, the Board of Trade had been busy establishing these exchanges, and in a few days they hoped to open about 80 of them in the principal towns of the country. Later, the number would be considerably increased by the inclusion of the smaller towns, but at present they had arrangements in hand for opening, either on February 1st or soon afterwards, about 80 exchanges in the principal towns, by which he meant, roughly, all towns with a population of over 50,000. They did not take the population basis absolutely, but that was a rough guide.

The Premises and the System.

Those exchanges were simply offices, in premises hired for the purpose, to which workmen might go when they wanted employment, and register their names, giving particulars as to their trade, qualifications, etc. The workmen would have to come in person. They would probably allow people who lived at a distance from the exchange to apply through the post, but, as a rule, the workman would have to go and register in person. He would answer certain questions, and then being registered, he would remain on the register for a week, after which he must go and renew his registration. He did not mean that they were only going to see these men once a week. Any likely workmen they would encourage to go each day until work could be found for them. If they were going to make a success of this at all, they wanted to have a labour supply pretty readily available. In Germany they had gone so far as to have waiting rooms for the men. He did not know whether they would come to that in England, but at present they proposed simply to try and get the men to call at frequent intervals in their search for work. If, when a vacancy was notified, they had not got a man available, they could always send out for him, but they wanted as far as possible to avoid that necessity. Ultimately, they hoped the exchange would be the place through which a man would usually get a job.

Telegraphic Address, "Labex."

With regard to the employer, the exchange was simply an address to which he could send when he had a job, for which he would want men. He would simply have to write to the labour exchange in any particular town, or he could telephone (all the exchanges would be on the telephone), or he could even telegraph. He might say that the telegraphic address would be, everywhere, simply the word, "Labex," and the name of the town. An employer, instead of writing and asking for men, might send a messenger or a foreman, who could choose between the men who were waiting at the exchange. It was suggested to the Board of Trade, in a conference they had with some of the employers' representatives, that it would be useful to have some of the exchanges open at night, so that a foreman who wanted men next morning could go and pick them out for himself overnight. That was a matter in regard to which they were not going to make any hard and fast rules, but which they were going to settle according to the circumstances of the trade and the locality. They wanted everywhere, so far as was possible, to fall in with the existing trade customs and convenience.

No "Hobson's Choice" for Employers.

There was one thing they were not going to do, and that was that they were not going to take from employers and foremen the business of choosing their own men. That was not the exchange's business at all. The business of control and choice and dismissal naturally remained with the employers. What they were going to do was to make certain that employers could get at once men to choose from, and they were going to make a sort of preliminary selection. He did not mean that the exchange managers would be able intuitively, at first sight, to judge whether a man was competent or not, but they would, as soon as they got experience, find out something about the men from the kind of reports concerning them

MR. W. H. BEVERIDGE.

Mr. Beveridge was educated at Balliol College, Oxford, and was elected in 1902 Stowell Civil Law Fellow of University College, Oxford. For a time he was Sub-warden of Toynbee Hall, and he has also been a member of the Central (Unemployed) Body for London, and acted as Chairman of the Committee which established the London Labour Exchanges. He is the author of a book on "Unemployment," upon which subject he is a recognised authority.

given by the employers, and in that way they would undoubtedly find out which of the men were no use at all, while, on the other hand, they might hear from an employer that such and such a man was good, and that he would like that man sent to him on the next occasion. In that way they thought there would come about a quite natural process of selection, not by deliberate action, but simply because the managers' one object would be to send men to suit the employers and not to send men who would bring the exchanges into disrepute. In that way, too, the exchanges would make it undoubtedly easier for men of good character to get at once into touch with a job, and as a consequence it would make it harder for the incompetent men to pick up the odd jobs that they did pick up now and again at the beginning of a building job.

Weeding Out.

In certain parts of the country it happened that there was a considerable process of weeding out at the beginning of every building job. Builders took on all the hopeless people that came along, and they had gradually to get rid of them. The exchanges were going to begin that process a little earlier, and instead of the builders having to take on everybody who came along, and to weed them out after trial, the exchanges were going to weed them out beforehand, because they would have made the discovery beforehand that those particular men were no good, and were not to be sent while there were better men available. There were, of course, times when employers might have to take on anybody they could get. He was afraid those times had not been very frequent in the building trade of late, but he supposed that even building would recover eventually, and then he was convinced that they would find the existence of the labour exchanges a very great advantage. Whatever might be the case in the big towns, it was not always easy to get men at once in the smaller towns, and it was not always easy to get competent men. That was roughly what the exchanges were meant to do.

There were one or two special points which he would like to mention. He had hoped to be able to lay before them the regulations which had been made general as to the working of these exchanges. Unfortunately, it had not been possible to get them published in time, but he could indicate roughly the principles which were to be adopted. As to travelling expenses, the Act enabled the Board of Trade to make regulations authorising themselves to advance travelling expenses to men travelling to jobs. That would always have to be by way of loan, and they could make loans either to the workmen or to the employers. If an employer wanted men badly and was willing to pay their travelling expenses, the exchanges would advance those expenses to the men for them. They would not, as a rule, advance money, but would give railway tickets, by arrangement with the railway companies, and either the men or the employers must repay the exchange later. That matter would be fully dealt with in the regulations.

Benevolent Neutrality.

As to the attitude they would take up in regard to wages and the question of strikes, briefly their attitude was that those things did not concern them. Questions of wages should be settled between employers and workmen, either collectively or individually, and the exchanges would simply give the information that they possessed. They would tell the workmen what were the wages offered, if they knew—and it was more useful that they should know—and the men could accept or refuse. As to trade disputes, when there was an actual strike, there again they had had a proposal made to them that they should shut up shop altogether. They felt that that would land them in difficulties in deciding as to whether there was a strike or not, and so they proposed to take the line, which was universally approved in Germany, that they would not shut up shop, but if there was a strike and they got a vacancy notified to them which was a vacancy caused by the strike, they would let the workmen know it was a strike vacancy, and he could go or not as he chose. They proposed all through simply to give information, and not to take responsibility for decisions in disputed questions. They were to be the servants of employers and workpeople, and not their masters.

Advisory Committees.

Thirdly, they proposed to have advisory committees. The control of the exchanges and the final decision must in every case remain with the Board of Trade. The officers would all be officers of the Board of Trade, but they thought that in some cases they might like to have a means of getting at the opinion of the employers and workmen of a district and therefore they proposed to establish advisory committees so as to refer such questions to them. Those committees would consist simply of employers and workmen, with a chairman agreed upon by a majority of both sides, and if he was not so agreed upon, then he would be appointed by the Department. He did not think those committees would have

to settle many disputed questions; but if there were any such questions. there would always be equality of voting power between employers and workmen, and the chairman himself would not have a vote. Thus, if there was equality of voting, the chairman would simply report the fact to the Board of Trade.

"Give it a Fair Trial."

He thought those were all the special points worth mentioning, but he would be glad to answer any questions put to him. He would like to ask them to give the system a fair trial. It was always difficult to persuade any body of business men that anything proposed from outside was going to be of advantage to them, so he would simply put it that it would not be a loss to them. He thought himself it was going to be a distinct advantage. Undoubtedly they had got an almost unanimous opinion that some sort of machinery such as this was necessary from the point of view of the workmen and of the question of unemployment. He would not weary them by quoting authorities, but it was a fact that all those authorities who had approached the matter from the point of the question of unemployment, had come to that conclusion. He hoped they would feel it possible, therefore, seeing that it was not going to be any loss to them, and that it might be an advantage, to give the system a fair trial. By a fair trial he meant not simply sending to the exchange once a year or so when they were in real difficulties for want of men; it was no good dealing at a shop only when they were in difficulties, because no shop would stock goods unless it had a fairly regular demand. The more they made a practice of sending to the exchange, the more likely they were to have a man for them in an emergency. It was no good waiting till the emergency came and sending only then.

[It May Make Mistakes.]

Another point was that it was not giving the exchange a fair trial to try it once and then have nothing to do with it because it happened to make one mistake at the beginning, and sent them an unsuitable man. They could not be absolutely secure against mistakes in the beginning; they could not be absolutely certain that every man who appeared to be qualified was absolutely competent, but they could make quite certain that they were not going to continue making mistakes, because they were bound to get a knowledge of the men gradually, in the working of the system. They therefore wanted the employers, if they got a man who was not suitable, not simply to dismiss him, and leave the exchange alone for the future, but to tell the exchange that the man was unsuitable, and to ask for a better man next time. Their one object would be to do better next time, and to bring the employers and the competent workpeople together more quickly than they did at present. In conclusion, he wished to thank them for listening to him so patiently. (Cheers.)

At the L.C.C. Central School of Arts and Crafts, a series of demonstrations dealing with the growth of a house began on Monday, February 7th, 1910, and will be continued every Monday during the session from 8 to 9.30. A complete set of working drawings of a small house recently built will be used. The peculiarities of the site so far as they have influenced the planning and construction will be explained; and the materials and work of every craft, also the drainage, hot and cold water supplies, etc., will be fully dealt with. Every student will be expected to bring a book for sketches and notes. Applications should be made at once to the Secretary at the school. A few more applications are also invited for the class in lettering and stone inscription carving, conducted by Mr. A. E. R. Gill, on Tuesday evenings, at 7 o'clock.

ELECTRIC CRANE AT HAMBURG.

This is a light crane which can be built of steel to any reasonable height—say, 50 feet. It revolves at the cab level, is driven electrically, and stands close up to the scaffolding. A number can be erected at one time along the front of the building, as they do not traverse.

THE BUILDER'S FOREMAN.

By Alfred B. Searle.

The advent of machinery and of new methods of construction in the building trade is revolutionising certain departments in a way which is too obvious to be overlooked and too small to be realised in all its fulness by those most concerned. In days gone by the primary qualification in a builder's foreman was his ability as a workman, and it was recognised that any young apprentice who had sufficient intelligence, and who was skilled at his work, might rise to the position. Within recent years, however, this has been altered so completely that some of the most successful foremen, employed by the largest firms, have only a superficial knowledge of the actual handicraft, and have been chosen more for their shrewdness and general capability of "seeing ways out of difficulties" than for their actual manual skill. Just as the clerk of the works is the technical representative of the architect or owner, so the foreman is the representative of the builder, and for this purpose a man skilled in the reading of plans, quick to see how to overcome those puzzling little problems which are always occurring, and which must necessarily, to a large extent, the unforeseen, and with sufficient personal "force" to have his instructions carried out promptly and satisfactorily, is worth far more, under modern conditions, than the best joiner, mason, or bricklayer who ever lived, if the latter is destitute of the qualifications just mentioned.

So great has been the change, in fact, that it is questionable whether any serious importance is to be attached to the supposed necessity for mechanical skill on the part of the foreman, and whether the demand of modern building construction is not creating the need for a type of man which cannot be produced as the result of an ordinary apprenticeship to a trade.

The ordinary workman of to-day—especially if he be of the sort out of which the older foremen were made—is a man who thinks much and who does not hesitate to express his opinions. He may have been badly misinformed as to the true state of affairs in the relationship between capital and labour in the modern state, and may have various theories and ideas, either original or imported, as to what should be his true position in life, and if these ideas are sufficiently dominant they may prove as much of a hindrance to his success as a foreman as they were a blessing to him as a craftsman.

For this reason some employers are seriously considering the advisability of employing as foreman men who have been trained specially for the purpose in technical and other classes, but who have not any special skill as workmen. They are doing this because the foreman who is a strong upholder of his trades union is inconvenient from the employer's point of view, and consequently it is easier to get certain kinds of work superintended by men trained apart from the ordinary apprenticeship, than from those who have been promoted in the ordinary way.

This tendency is to be regretted, for it is based on a fallacy as to the fundamental duty of the foreman, and assumes (which is by no means correct) that the foreman's chief work is to keep the skilled and other workmen profitably employed and to prevent waste of time.

As a matter of actual fact, the foreman's true position is to stand intermediately between the employer and the individual workmen and to see that, as far as possible, the interests of both parties are fully secured. This is by no means so easy as appears at first sight, for the tendency is for the masters to overwork the men, or to make impossible conditions on the one hand, and for the workmen to "slack" and waste time (and therefore money) on the other. Hence one of the primary requisites in the modern foreman must be the ability to judge fairly any complaints or suggestions which must be received from either party, and to give a wise opinion thereon.

This implies the selection of middle-aged men as foremen, for younger ones are apt to fail in appreciation of the men's position, and to be so anxious to please their employers as to have but little influence on those who are, after all, their fellow workers.

Indeed, "influence" is the keynote to the whole position. Without it a man may be extremely clever as a worker or as an organiser on paper. He may have ample knowledge of the technical side of his work, but he cannot get other men to work efficiently. One of the easiest ways for a foreman to lose influence is to prove his incompetency as a workman, for there is nothing which makes it so easy to ridicule a man as to attempt to show another how to do a piece of work and to fail to do it himself. For this, if for no other reason, it would appear to be always necessary for a foreman to be a good all-round workman. Indeed, it is difficult to understand how a man can justly decide the wage-earning value of a particular operation unless he is able to do the operation himself, and thus know the amount of thought and care, as well as the actual time required.

Quickness of perception and the power to control other men are thus found to be only two out of many important characteristics required in a foreman; a thorough technical knowledge, not only of his own trade, but of all those allied to it. Perhaps if a single characteristic were to be selected as the one of greatest importance at the present time, it would be a sympathetic attitude to both masters and men, for with this a foreman will be able to influence both his employers and those under his charge. He will be able to see that justice is done between the parties, and by the judicious expression of his own opinion, based on his knowledge as a workman and as a technical student of both the trade itself and of economical problems affecting labour and capital, he will prove a valuable aid to the success of the firm employing him, and an equally valuable friend and adviser to those he is employed to direct. A truly sympathetic attitude will prevent him from favouritism on the one hand and excessive harshness on the other, and will be his chief means of carrying out his duty with the least friction. It will enable him to suggest improvements to his employers in matters of construction and arrangements, and to effect economies in costs without undue hardship on the workmen.

THE RE-BUILDING OF THE CAMPANILE, VENICE.

By A. G. H. Thatcher.

The collapse of the Campanile in 1902 has proved to be only an event in its history. Its re-erection will give additional zest to future reading of the story of one of the most interesting buildings in Europe. A very short résumé of the principal incidents recorded since its foundations were laid will perhaps be acceptable. To the Doge Tribuno Memno is usually attributed the honour of commencing the pile, between the years 880 and 912. An old tradition preserved in the library of St. Mark's states that the groundwork was of extraordinary area and depth, but some excavations by Signor Boni in 1885 proved this to be incorrect.

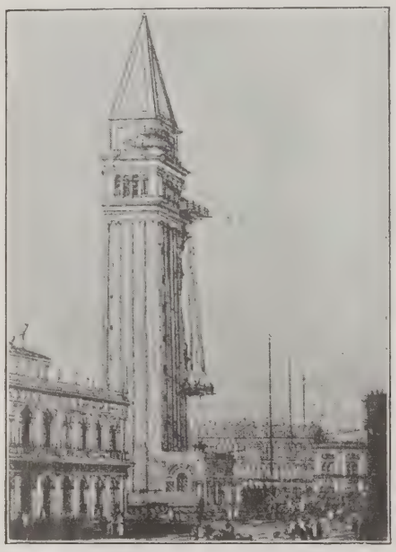

FIG. 1.—THE CAMPANILE OF ST. MARK, VENICE.

From a picture by Canaletto at Windsor Castle, showing the swinging cradle.

The base was then found to be of 12 stone courses, having a height of 16ft. 6in., two feet of which at the time rose above the pavement level, although with the old pavement this rise was about 3ft. 6in. The exposed portion of the base ranged round the square tower as steps. The stonework was carried on horizontal oak beams resting on clay, and kept together by piles of white poplar.

It would appear that for a considerable period only the lower portion of the Campanile existed, and that it was then chiefly used as a watch tower. Further evidence shows that a completion was reached between the years 1148-1157, and that the dimensions were: Height, 230ft., and plan, 40ft. sq.

In 1178, a wooden belfry was added, the credit for which is given to Barratièrs. From then until 1328 nothing in particular is recorded, but year later a restoration was carried out by Maestro Montagnana. In 1388, lightning took effect upon it, and about 1403 the upper portion was burnt. Timber was again used in its construction, but it only lasted some fourteen years, when fire, caused by the effect of a thunderbolt, again made destruction. The lessons learned from these disasters suggested the use of stone in the reconstruction. and the tower was carried somewhat higher than before. In 1489, lightning again played havoc, and it was not until 1511 that a commencement was made to substitute a permanent structure for the temporary covering. Partly owing to an earthquake shock, reconstruction from the cornice upwards had become necessary, and was completed rapidly in 1514.

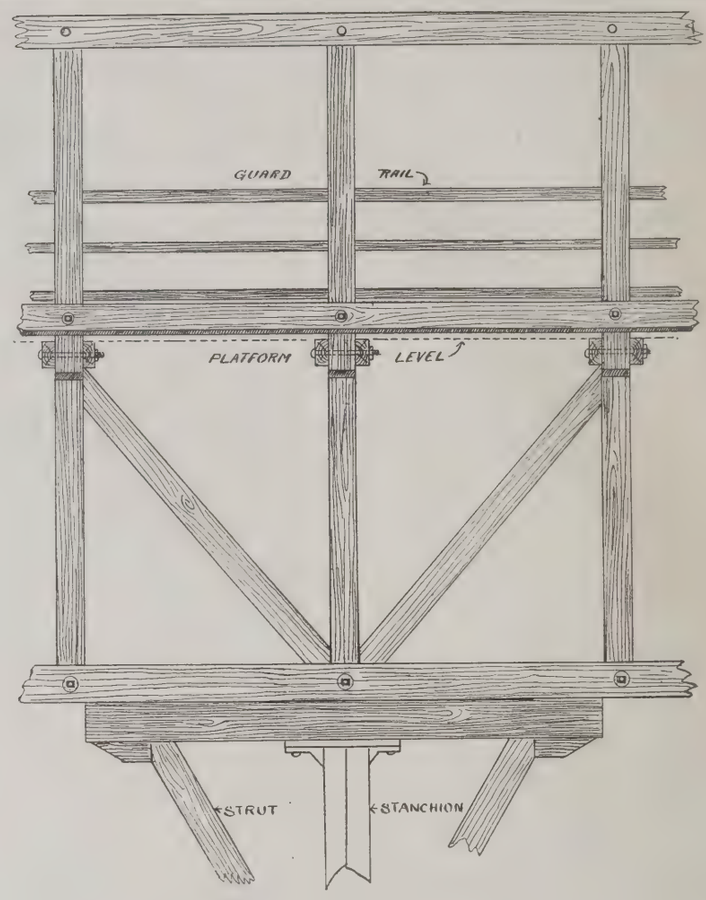

FIG. 4.—ELEVATION OF RISING PLATFORM.

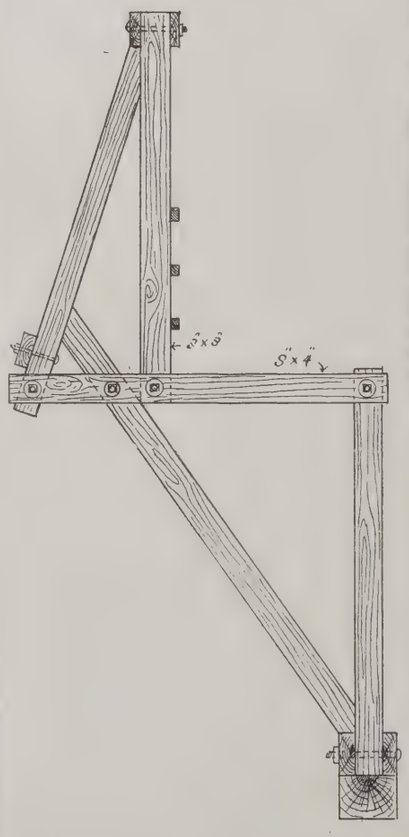

FIG. 3.—SECTION OF RISING PLATFORM.

An added beauty was given to the tower in 1540 by the erection of the Loggetta designed by Sansovino.

In 1548 and 1565, lightning was responsible for further damage, and a restoration was made after the second occurence. Further damage was done by lightning or fire in the years 1656, 1745, 1761, and 1762, but a conductor fixed by Waldo in 1776, has been very effectual.

From that time, until the recent collapse, little has to be recorded. Additions were made to the Logetta for its further adornment and enlargement, and about 1873 the somewhat insignificant shops which had been, during the course of time, erected around the tower were cleared away.

During the latter part of the nineteenth century, many rumours were abroad as to the defective condition of the building, and some steps were taken to ascertain how far these suspicions were correct. It came too late, however, and the structure fell on July 14th, 1902. An eye-witness, in describing the scene, has said that early on that day little puffs of dust were seen issuing from the cracks in the main walls. These increased in volume, and it was at once seen that internal disintegration was taking place. The Piazza was immediately cleared and railed off by poles, and very shortly afterwards the whole erection buckled, as it were, and fell towards St. Mark's Cathedral. The Loggetta was, of course, demolished, but no lives were lost, not even a pigeon perished the Venetians somewhat proudly say.

The fallen material lay as it fell for some 8 months, when steps were taken to commence clearance and rebuilding. Further delay afterwards ensued. It was found necessary to renew the piling under the walls. The first bricks provided proved to be unsuitable, and some argument ensued as to whether the steps around the base should be

FIG. 2. THE CAMPANILE OF ST. MARK, VENICE.

This view shows the progress of the new Campanile by September of last year. Details are given in the article and drawings on the opposite page of the unique form of scaffolding adopted for the construction, a form which might be equally suitable for similar structures in this country.

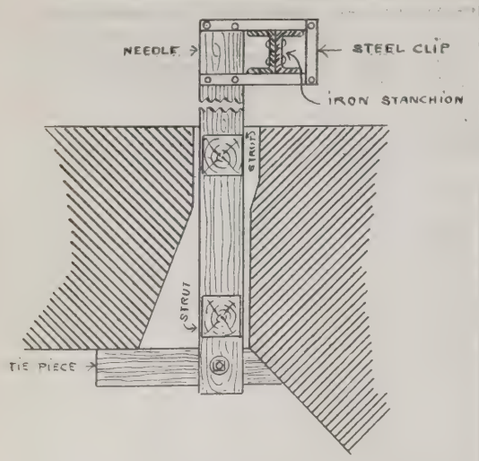

FIG. 5.—PLAN OF CLIPS TO STANCHION.

3 in number as before the collapse, or 5 as originally built on the lower pavement. The material was carefully sorted over, and much —especially that for the Loggetta—will be re-used. This portion of the building is being carefully pieced together in the courtyard of the Doge's Palace in an effort to re-use some of the rare marbles; and doubtless when re-erected, it will present largely its earlier appearance.

The tower itself is being built to its previous design. It is probably well known that until the cornice is reached no staircase exists, the ascent being made by a series of "pontes" or slopes, some 37 in number. It is said that about the year 1905 Napoleon ascended these on horseback.

The bricks for the new erection are from Treviso, some 30 miles from Venice. They average in size about 12in. × 6in. × 3in. Istrian stone is being used where such work is required. At the present time the height to the cornice has been reached, and it will therefore be some time before completion takes place.

Apart, however, from its architectural history, the Campanile has a peculiar interest attaching to the particular types of scaffolding that have been used in its repair and re-erection.

In 1745, after one of the periodical impairments due to lighting, the repairs, which proved necessarily extensive, were undertaken and carried out by means of a hanging scaffold raised and lowered by a windlass..

A drawing in Windsor Castle by Canaletto (Fig. 1) shows the arrangement, with a considerable amount of detail. The records of the time refer to this scaffolding as being invented for this express purpose, and it is possibly the first example of what is now known as a painter's boat or cradle. The Italian engineers must have a special aptitude for designing scaffolding, for they have, in the re-erection now going on, devised a system which, so far as the writer is aware, has no parallel. Fig. 2 is a general view of the structure as it exists at present.

When a height of about 40ft. had been reached, a framework to carry a platform was built entirely around the tower. Figs. 3 and 4 show a section and elevation of this in detail. A reference to the elevation (Fig. 2) will show that a series of small windows are built in the walls. They are arranged to throw a light on each landing, so that they exist also on each façade. This afforded the engineers an opportunity of which they readily availed themselves. When it became necessary to raise the platform, lengths of channel iron were bolted to the lower beams in duplicate to form an H stanchion of each side of the frame, so that they would hang vertically over each series of window openings, and by these the framework was raised. Additional lengths of channel-iron were added as the scaffold was worked up; and to keep these stiff, collars were fixed in each window to clip the irons. This is shown in Figs. 5 and 6.

The lifting arrangement is shown by Fig. 7. Beams carried through the walls as cantilevers formed the required support, and carried a metal base from which the purchasing power could be gained. The steel plates or beds were perforated in their centres, so that a steel screw rod about 20ft. long could be passed through each. The perforations were not at right angles to the bed, but slightly inclined, so that the lowest ends of the rods reached the channel iron support to the scaffold itself; and to this they were strapped and bolted. On the iron beds, hollow steel barrels with a female thread were placed, and received the steel screw rods. As shown in the diagram, the stanchion could then be forced upwards by means of capstan bars turning the steel barrels. The rate of progress was slow, about 1oft. in two hours. Two men were required to each handle during the operation. The exceedingly slow movement had its advantages, in that there was less likelihood of an uneven rise in the framework above. The pliability of the steel rod is necessary to allow the standard to rise without causing undue cross stress upon the rod itself.

For the purpose of erecting square towers, this system of scaffolding has many advantages. Ordinary pole scaffolding will not stand above a certain height with safety; it then requires a new base; and the same may be said even if square timbers are used, with the exception that the possible height is greater. This difficulty was met with in erecting the tower for the Roman Catholic Cathedral, Westminster. The scaffolding

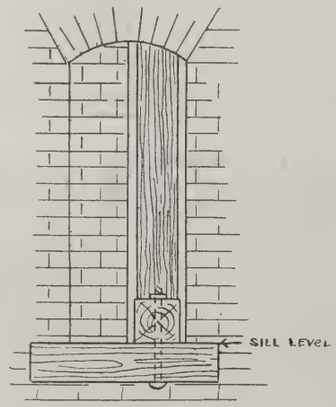

FIG. 6.—ELEVATION OF CLIP TO STANCHION SEEN FROM INSIDE THE BUILDING.

there was erected internally, and showed a tendency to buckle when about half the ultimate height was reached, necessitating a fresh base of timbers laid from wall to wall.

With the Campanile erection, the pointing and cleaning down can be carried out by bringing the framework down in the opposite manner from which it was raised, so that it is difficult to see any real disadvantage to its use. Being of a more scientific nature than ordinary scaffolding, the knowledge of an engineer would be required to ascertain the proper strength needed in the materials used, also that the structure would maintain its rigidity. In this particular instance, the margin of strength is such that the higher portions of the building are to be erected by means of more ordinary scaffolding which will stand upon the framework as it now exists, supplemented by booms laid across the building, as seen in Fig. 2.

The materials, bricks, etc., were hoisted up the interior of the structure. For the safeguarding of the workmen, a guard-rail was fixed, as shown in Figs. 3 and 4, and this was increased in value by the use of netting, which completely enveloped the whole of the scaffolding on the outside.

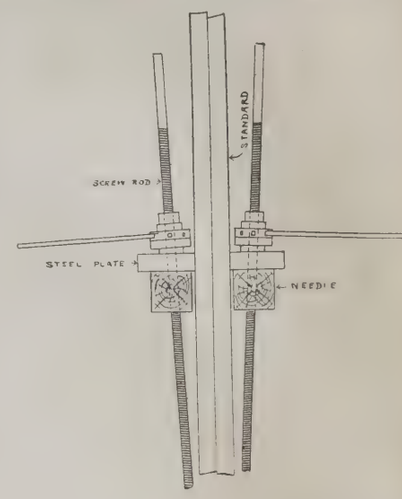

FIG. 7.—THE RE-BUILDING OF THE CAMPANILE, VENICE. FRONT VIEW OF APPARATUS TO FORCE IRON STANDARDS UPWARDS.

SECONDARY SCHOOL, YORK.

The new municipal secondary school for girls has been erected by the Education Committee of the York Corporation on the Sycamore estate, facing the river Ouse, from which it is separated by two fields. The north elevation forms the entrance front, and extends to a total length of 202ft. The style is Renaissance, with tiled roof and small gables. The main feature is the central building, the school assembly hall showing five large circular-headed windows, the semi-arches of which are formed of small tiles. In front of the hall is a one storey building, with the main entrance in the centre. The stonework of the entrance is of "Queen grit" stone, with a very fine grain, and extremely suitable for outdoor work On either side of the entrance is a small window formed of the same kind of stone. The extensions or wings at each end of the central assembly hall are lower than the main building, which gives variety to the elevation. The wings contain latrines, lavatories, cloak-rooms, etc., and at the west side are also a large lecture theatre, while in an extension to the south are domestic science room, dining room, etc. At the east side there is a similar cloak-room accommodation, and also a very commodious and completely furnished chemical laboratory. On the south elevation the building forms three sides of a square, the open side being towards the river and affording a fine view beyond the Ouse. As the expense was rigidly kept down there was no room for anything ornate in the external architecture of the school. The whole of the bricks were of local manufacture, supplied by Messrs. Wray and Sons. There is some effective ornamental cornice work in brick. The roof tiles are thick sand-faced. The whole of the internal woodwork, doors, architraves, mouldings, skirting, etc., is in bay mahogany, which imparts great richness to the building, and contrasts particularly well with the generally light silver grey tones of the walls. The architect is Mr. W. H. Brierley, of Lendal, York, and the clerk of works Mr. F. W. Cotton. The general contractors are Messrs. Wm. Airey and Son, of Leeds. The sub-contractors were: Dodson, tiler; Shouksmith, blacksmith work; Bellerby, painter; Cram, plaster; York Corporation Electricity Department, electric lighting. The building has been fitted throughout with Osram lamps.

Of the sixty or seventy Labour Exchanges which were opened last Monday week, nineteen are in London. "Their work," said Mr. Winston Churchill, in an interview, "will be all uphill until they get a wide *clientèle* among employers."

THE CONCRETE INSTITUTE.

Mr. Matthews's paper on "Reinforced Concrete" Chimneys was reported in our last issue.

The Discussion.

In the discussion which followed the reading of the paper, the Chairman (Mr. W. T. Hatch, M.Inst.C.E.,), remarked that there was room for other than brick chimneys was suggested perhaps by the fact that there were very few such structures without more or less extensive signs of being cracked.

Mr. William Dunn said there was no doubt that reinforced concrete was a suitable material for chimney construction. There has been failures, but those failures had been from faulty construction or design, from defects within their power to control. Mr. Matthews had only referred to one failure, but in the investigation made by Mr. Sandiford E. Thompson for the Association of American Portland Cement Manufacturers in 1907 (in which he investigated about 400 chimneys), he mentioned more than half a dozen complete failures—blown down, fallen down, or torn down because of their defective condition. Brick chimneys, as the chairman had said, usually showed cracks; indeed, it would be strange if they did not, as the temperature inside was so much above that outside, especially when there was a gale of wind and sleet. The inside lining of the lower part was a protection, but the temperature all up the shaft remained high. Indeed, it was only about 20 per cent. or 30 per cent. less near the top than at the bottom, so that at the top of the inside lining, where the shaft was not protected, one would expect to see cracks. From photographs of reinforced concrete chimneys which he had seen, such cracks were found, both horizontal and vertical cracks, and though sufficiently alarming were not necessarily dangerous. At that point there was also usually a reduction in the diameter of the shaft, and especial care was required with the reinforcement. One difficulty in chimney design was that one must proceed by trial and error, as in the case of arches. i.e., adopt a design and test it for stability. The excellent paper in "Engineering" referred to by Mr. Matthews, gave a formula for the thickness of a chimney according to the stresses allowed the bending moment, the mean radius and the weight above the section, but as the weight varied with the thickness, one had to adopt a tentative thickness first and to test the section afterwards. For those who did not follow reasoning expressed by means of the calculus, Mr. Dunn suggested the graphical method of calculation, which would be found in a paper he contributed to "Engineering," published on December 25th, 1908. It had not that great advantage which was to be found in Messrs. Taylor, Glenday and Faber's paper, of giving a rule for the thickness of chimneys, but it gave a very simple means of determining the stresses in circular reinforced sections under combined stresses, which could be understood without a knowledge of the calculus. The durability of a reinforced concrete chimney was largely a question of temperature. It appeared from experiment with cubes and from experience with actual structures that temperatures of 400 degs. to 600 degs., such as were really met with at the base of chimneys, did not injuriously affect gravel concrete. It was only after a temperature of 750 degs. or thereabouts had been reached that injury resulted. This left a comparatively small margin in case of excessive temperatures. Of course, concrete formed of limestone should never be used for work exposed to great heat. The tests made by Prof. Norton had shown that limestone concrete began to lose strength at temperatures under 500 degs. Mr. Matthew's experiments were made with concrete with an aggregate of iron works clinker which had been exposed to fire; but actual experience with chimneys was worth more than laboratory tests, and they were very much indebted to Mr. Bamber for his exceedingly interesting report on an actual chimney. Mr. Bamber was a careful and accurate reporter, and they should attach very great importance to what he said. Mr. Dunn suggested that the concrete used in chimneys should be a slightly wetter mixture than was usual, in order to secure proper adhesion to the bars. He also thought circular rods seemed preferable to T bars for the reinforcement, owing to the special care required in tamping the concrete round T bars to secure adhesion. Mr. Matthews had said there was a saving of about half the time compared with a brick chimney, but Mr. Dunn said he would not like to claim that advantage for reinforced concrete chimneys. In all chimneys the rate of execution was limited to a few feet in height per day, and he doubted the wisdom of going further with reinforced concrete than brickwork.

Mr. Percy Taylor thought that the linings of reinforced concrete chimneys could be more conveniently constructed in sections and supported on brackets from the outer shell with allowance for expansion. He thought this would expedite erection, as much time was taken up in constructing the double shell in the first half of the chimney of the kind dealt with in the paper. He referred to difficulties of design, but stated that by the use of plotted curves simple formulæ could be used to design work fairly quickly and conveniently.

Mr. James Lyle said his firm had built a reinforced concrete chimney 261ft. high by 20ft. diameter, and they had some cracks in it. Mr. W. Johnson, engineer to Messrs. A. Lyle and Sons, Ltd., said before they had decided to build a concrete chimney they made several blocks about 3ft. square by 6ins. thick, reinforced and made in a similar manner to ordinary reinforced concrete with small ballast and mixed very wet. Those blocks had been in the flues subjected to about 600 degs. to 700 degs. F. for 3½ years, and the concrete was practically destroyed. He knew that there was very little difference in expansion between steel and concrete, but there was some, and it was his opinion that that had had some some effect in the result. Messrs. Lyle's also made two blocks 2ft. by 2ft. 8ins. thick with an aggregate of 3½ parts sand to 1 of cement, mixed dry and reinforced like the chimney. These blocks were well rammed, and had been in the flue 2½ years, and there was no comparison between them, and the blocks they mixed wet. He did not agree with Mr. Thompson in the report on American chimneys that the concrete should be mixed wet. He thought a deformed bar should be used, and the concrete be made, consistently with a good job, as dry as possible, with just a little moisture coming to the top, and that this concrete would stand heat much better than concrete which had been mixed wet. After their chimney had been erected 12 months they scaffolded up the inside and examined the lining. They swept off the soot, which was about ¾in. thick, for a height of 90ft., and found at the offset about seven or eight cracks—definite fractures. These were not air or surface cracks; they varied from ⅛in. to 3-16ths in. in width. They had not the same number of cracks on the outside as on the inside. They had three or four on the outside, and these were much smaller. This was against all theory, but there it was. They had recently strapped their chimney up to 12 or 16ft. above the offset. They saw nothing in the chimney to cause alarm, but thought seeing there were these fractures, that it was better to take it in time and prevent the cracks going further. The straps were placed 6ft. apart. He thought a lining to a reinforced concrete chimney should be built after the body of the chimney, and quite separate and apart from the outside shell. If he were building a chimney again he would take the lining to the top and allow an air space of not less than 10 to 12ins. A good many ducts should be made through the outer shell so that air could pass freely into this space and keep the outside shell cool. He thought a thick offset was wrong. The big mass of concrete and variation in the diameter at that point caused unequal expansion. The chimney should be taken parallel from the bottom to the top, and with as little variation in the thickness as possible.. If a reinforced concrete chimney were properly designed and properly built, it would be a good chimney. He thought there was as much in the building of a concrete chimney as there was either in its shape or the material that was put into it. A responsible man should be on the chimney the whole of the time from start to finish, because so much was left in the hands of the men putting it up, and if one mistake was made the chimney was faulty. They had to put a man in charge of their chimney during construction, and he had no doubt if any of them built a similar chimney they would have to exercise the same care.

Mr. Alfred Brown, of Belfast, thought a brick chimney could be built as quickly as a reinforced concrete one. He had had a 200ft. brick shaft erected in three months,

HENLEY MEMORIAL HALL, MANSFIELD. TEMPLE MOORE, F.R.I.B.A., ARCHITECT.

The building consists of a main hall with three class-rooms on the south side opening out of it. The largest class-room immediately to the south of the platform, is separated from the hall by a folding screen so that it can be used in conjunction with the hall when required. There are two cloak-rooms at the main entrance, also convenient kitchen, etc., provided beneath the raised platform of the hall. The building is designed to harmonise with St. Marks Church and is faced externally with local stone. There is a handsome 3-light window in the west gable above the porch and the hall is further lit on either sides by dormer windows in the open timber roof which is of a simple hammer-beam construction.

and working in 14 weeks from commencement.

Mr. Oscar Faber, B.Sc. (Lond.), A.C.G.I., referred to the desirability of keeping the thickness of chimneys as small as possible, firstly because it was easily demonstrated that it was cheaper to stress the steel at a low unit stress, and put a comparativelly large quantity of steel in the shell, with a thin shell, than to adopt a thicker shell with a lower percentage of steel. Then the chief practical difficulties in making a successful concrete chimney were to prevent it from cracking, and there was no doubt whatever that the thinner the wall was made the less tendency there would be for the concrete to crack, due to temperature stresses, which depended entirely upon the difference in temperature between the outside and inside of the shaft, and the smaller the thickness the less would be the difference. In the chimneys at Northfleet in every case the tendency to crack was at the outside of the chimney, which was what one would expect. It was very curious that the chimney at Messrs. Lyle's works should have cracked in exactly the opposite manner.

Mr. Matthews, in replying, did not agree with Mr. Dunn that a wet mixture was desirable. He thought round bars were preferable to T bars for the reinforcement in chimneys.

THE GUILD OF ARCHITECTS' ASSISTANTS.

South Wales Branch.

The first annual meeting of the South Wales branch of the above Guild was held in Cardiff on Thursday, January 27th. In the unavoidable absence of the hon. secretary, Mr. Harris gave a résumé of the progress which had been made since the formation of the Guild. He said a lot of uphill work had had to be accomplished, for, as always happened in forming new organisations, there was a tremendous lot of labour involved in overcoming the lack of enthusiasm which existed among those whom the Guild was formed to benefit. Everyone recognised the need of such an organisation among architects' assistants, and yet few seemed willing to put their shoulders to the wheel and help on the work. There was a lot of preliminary and it might seem to some thankless labour before any great measure of success could be attained; and yet he was certain they had every reason to be pleased with their progress. In time he felt sure the Guild would be a real live force in the profession, and of inestimable value to the younger generation of architects.

The constitution of the Guild was then fully discussed, and the proposed laws and regulations were in general approved. The relations of the local branches to the central body came in for some detailed criticism, but it was generally conceded that the proposals submitted to the members (published in the papers the preceding week) were for the most part quite satisfactory, and the hon. secretary was instructed to report to this effect to headquarters. There is therefore every expectation that if the other branches adopt the proposed "constitution," the Guild will soon be recognised as a firmly organised national body.

Manchester Branch.

The inaugural meeting of the Manchester branch of the Guild of Architects' Assistants was held at the rooms of the Manchester Society of Architects on Thursday, Jan. 20th last, with A. E. Corbett, Esq., A.R.I.B.A., in the chair. The Chairman expressed himself as being in general sympathy with the objects of the Guild, but, in regard to education he thought that assistants might well leave the question to older men, men who had more experience of actual practice. He also suggested that the insurance programme of the Guild might very well be extended to sick and death insurance and, the fourth object of the Guild, that of the formation of a Federal Council of all existing societies, be regarded as very dubious of accomplishment.

Mr. Herbert Cox, a member of the Provisional Committee of the Guild, then delivered an address explaining its objects and methods. He pointed out the arrival of a purely commercial type of principal who was not only entering into competition with, but gradually squeezing out the older men, and had proved himself more likely to expect an assistant to work under irksome conditions both as to salary and employment. The report of the Provisional Committee was then read, and the procedure of the Guild in the matter of employment bureaux and insurance was fully described. The R.I.B.A. examinations were then criticised by the speaker, and the examination in steelwork specially referred to. He hinted that the character of the examinations would be much improved by the introduction of paid examiners. The object of the Guild was to set up a more exclusive standard and to assist only those actually within the profession. The movement in relation to the proposed Federal Council could only be brought about by a strongly organised body of assistants, and then their case for education as well as for other perhaps more important matters would obtain the official recognition of the profession.

The meeting was then thrown open to discussion, in the course of which the chairman stated that he had recently advertised for an assistant and found his own society inadequate; he had received many replies from men who had been in practice for themselves and some had held good Government appointments. It was shewn that the scheme of unemployed insurance would be managed by a special sub-committee of the Finance, Committee, the members of which would only be elected by those participating in unemployed benefit. There would be no place for the "wastrel" because the qualifications of all full members would be carefully studied.

The committee for the branch was then elected with Mr. P. Caminesky, A.R.I.B.A., 24, Brunswick Street, Chorlton-on-Medlock, Manchester, as hon. secretary. The meeting closed with a vote of thanks to Mr. Herbert Cox and the chairman.

THE WARMING AND VENTILATION OF PUBLIC BUILDINGS AND FACTORIES.*

By T. W. Aldwinckle, F.R.I.B.A.

Public Elementary Schools.

One of the most difficult buildings to warm and ventilate is a public elementary school. The cubic space per child in the class-rooms is only 140 ft., and windows are not desirable (for lighting purposes) on both sides of the room. Open fireplaces are almost out of the question. This is an instance when "natural" ventilation fails altogether, the proportion of CO_2 with such ventilation often rising to as much as 18 parts in 10,000 during the winter months. Any attempt to improve this by large inlets of air through open windows only lowers the temperature to 52 degrees or 53 degrees, which is much too low for children to sit and work in, to say nothing of the inevitable draughts. Dr. Kerr, the Medical Officer to the Education Committee of the London County Council, in his report for the year ending March, 1904, points out the failure of natural ventilation in the case of London schools, and strongly recommends mechanical ventilation, preferably a combination of plenum and exhaust, with an air supply of 1,500 cub. ft. per child per hour, which is about 11 changes of the air per hour. The effect of temperature upon the children's work is also dealt with by Dr. Kerr. He says: "From enquiries it seems that the London school child takes little notice of variations in temperature between 56 degrees and 64 degrees, and apparently does its best work at about 58 degrees. A fall below 55 degrees gives rise to comment, and a rise to 65 degrees to unpleasant subjective symptoms, slackness and inattention in some, headaches in others."

As to the relative merits of "upward" and "downward" ventilation, much will depend upon the character and purposes of the building. The exhaust system seems to lend itself to upward ventilation, and provided that the air inlets are not too high above the floor line the arrangement is simple and effective. It is most suitable for council rooms, class-rooms, factories, workshops, and the like, where the air is removed at once upwards from the breathing line. It does not appear to be so suitable for any class of building with galleries. There is also this in its favour, that as the vitiated air is warm and tends to rise, and as the convection currents set up by the bodies of persons are also upward, the upward system is following to some extent natural laws.

There are, however, instances of exhaust ventilation, notably the removal of dust, etc., from factories, where downward exhaust is far preferable.

Places of Public Assembly.

Downward mechanical ventilation would seem to be the most suitable for theatres, public halls, and all crowded places having galleries, the system being plenum with exhaust. The warmed fresh air can be driven in at a moderate velocity from the ceiling, or at a level near the ceiling line, without causing any preceptible draughts. The air intake being at the top of the building, the source will be purer than elsewhere. The incoming air will be naturally distributed throughout the whole of the auditorium, and will find its exit at the lower part of the hall, the outlet current being induced by exhaust fans, and the exits being under the seats, against the walls, and in other suitable positions. and not causing any perceptible draughts. This is preferable to bringing in the fresh air under seats and similar positions, as such inlets cannot be kept clean, but will always be clean enough for vitiated air to pass out through. As the audience are, after a short time, as previously explained, practically providing all the warming, it is a great advantage that the entering air, which under these circumstances must be cool, should enter at some distance from the audience, or cool draughts might be experienced. The trouble as to the vitiated air of one tier of galleries being carried up or down to to another (a trouble associated with both upward and downward systems) can, to some extent, be obviated by having exhaust outlets in connection with each tier. Theatres and similar buildings are usually free from the down draughts arising from the cooling surfaces of windows and skylights, and this greatly simplifies the arrangements, as these down draughts are very serious and very difficult to deal with.

It is possible to have the plenum upward system without auxiliary exhaust, provided the outlets are efficient in area, in suitable positions, and properly protected against the disturbing action of wind, but downward ventilation with plenum only would not be so successful, as it is impossible to arrange outlets near the floor line, without providing some exhausting power, as the downward current is in opposition to the natural upward tendency of the vitiated air, and such outlets would be useless against the wind, and would most probably, some of them at least, become inlets. It follows, therefore, that in many cases the plenum and exhaust downward system will be somewhat expensive to instal, but its superior advantages are great, and it is the most complete system of ventilation I know of. The vitiated air is at once removed below the breathing line, the dust caused by work is removed beneath the worker, and the fumes from the laboratory benches are removed beneath the chemist or student. This is particularly the case in factories which are mostly top lighted. Any

*Concluding part of an abstract of a paper read before the Association of Engineers-in-charge.

attempt to get rid of the air at the top is considerably checked by the downward currents of cold air set up by the cooling surfaces of the skylight. It is preferable, therefore, to have the warm air inlet sufficiently high and so deflected that the current of warm air shall travel along or near the ceiling line, and subsequently descend to the breathing line. The downward current will in that case be comparatively pure air.

In this connection it may be mentioned that the "natural" ventilation of a hospital ward in winter, with open windows and open fires, is practically "downward" ventilation, the open fireplaces being powerful exhausts close to the floor line.

Whatever the system of ventilation adopted, be it natural or mechanical, upward or downward, what is required is frequent changes of the air in the room, thus providing a large amount of air per occupant, the movements and distribution of the air being so arranged and controlled that the impurities which are given off shall be removed as soon as they arise without the possibility of their accumulating.

At the new bacteriological laboratories, recently erected at Sutton for the Metropolitan Asylums Board, I provided a system of plenum and exhaust ventilation and warming upon the lines I have here indicated. There are seventeen rooms thus ventilated, varying in size from 13ft. by 10ft. to 17ft. by 13ft., and all are 10ft. high, and are on both sides of a central corridor. The building is one storey high, with a small basement. The fresh air is admitted through a large louvred opening, passes through a filter screen previously described, and is driven through a heating battery into the main central duct by a centrifugal fan at the rate of 180,000 cub. ft. per hour. The heating battery consists of 10 two-column radiators, each of 80ft. heating surface, in which water circulates at a temperature of 150 degrees F. Each radiator is controlled by a valve, so that any part of the battery can be put on or off, and thus regulated to suit the external temperature. The central duct is tapered and has low-pressure hot water circulating pipes in same to maintain the temperature of the air. From this duct rise glazed fireclay branches, leading to the vertical inlets in the room, 18ins. by 9ins., and 8ft. high, of cast iron, the whole of the front except the air inlet at the top being a door, as access for cleaning. Each inlet has a regulating valve, and is placed against the inner wall opposite to the windows. The air enters the room at a height of 7ft. 6ins. from the floor, at a velocity of 3½ft. per second, and the momentum carries it along the ceiling line to the opposite side, where the cooling action of the windows causes it to descend. It then comes under the suction influence of the exhaust, which is close to the floor level, on the same side of the room as the inlet. The air is then drawn into an exhaust duct below the floor, which runs into a vertical brick shaft about 28ft. high, at the top of which is a propeller fan discharging the air into the atmosphere. The power of the exhaust fan is somewhat less than that of the inlet for the reason already stated. The air of the rooms is changed about six times in the hour, and a temperature of 60 degrees is easily maintained when the external temperature is 20 degrees. Owing to the heating surfaces having a low temperature, this is a complete absence of that closeness and heaviness in the air of the rooms, so frequently complained of in plenum system.

Ventilation of Factories.

The ventilation of factories is a subject by itself, as not only have the rooms to be warmed and ventilated, but noxious matters arising from many of the manufactures have to be separately removed, as near as possible at their point of origin, so as to prevent them from mixing with the general air of the room, and this we term "local" ventilation, as distinguished from "general" ventilation, which relates to the removal of vitiated air from the room. As regards general ventilation, the majority of factories are content with natural ventilation, as the results of open windows and skylights with steam heating, there being usually plenty of steam available. This is generally satisfactory, where there is a fairly large cubic space per worker, but not otherwise. The Factory Act only requires a cubic space of 250ft. per worker, except during overtime, and the inspectors will pass a maximum of 12 parts of CO_2 in 10,000 during daylight, and 20 parts when gas is used as an illuminant. These are not very exacting standards. With a small cubic space mechanical ventilation is absolutely necessary, and according to tests in Haldane's Departmental Report of 1902, very satisfactory results have been attained in many factories where both plenum and exhaust fans have been used.

The removal of local impurities is, however, quite a different matter, and requires special treatment. The impurities to be removed consist of dust, fumes, steam, poisonous spray, sawdust, textile dusts, dust from metal polishing and grinding, and the like. Very interesting particulars of the methods in practice for getting rid of these impurities are given in Dr. Haldane's Second Report on the Ventilation of Factories and Workshops (Appendix), issued in 1907. The general principal is downward exhaust ventilation, occasionally supplemented by a plenum inlet. The point of origin of most of these impurities being at the worker's bench, and consequently below the worker's head, it is essential that such impurity should be immediately removed downward, so that it cannot be breathed by the worker. The introduction of a plenum inlet above the work will emphasise this downward movement, and prevent any dust from rising. In some cases the dust is drawn into a hood on a level with, but in front of the worker, in which case the plenum jet of air is at the back of the worker. But in every case the impurities are at once removed away from the worker. These extraction shafts remove the air and impurities at a very high velocity, much higher than the general ventilation. In the case of noxious fumes, such as those from linotype composing machines, the extraction is upward, there being placed over each melting pot a conical hood connected with a vertical pipe running into a horizontal trunk overhead, at the end of which is placed a powerful exhaust fan. At a very large cabinet-making works near London, where about 2,000 workpeople are employed, I saw an excellent system of both upward and downward exhaust ventilation in connection with the numerous circular-saw benches, and other apparatus. The light sawdust was removed from above the bench, and the heavier chips were removed below the bench, all passing into overhead and underground trunks eventually uniting above, the material being driven into a chamber above the boiler house, to be sent through hoppers into the boiler house for use as fuel. The power to drive these fans was about 80 h.p. The whole of the foregoing arrangements are in the interests of the health of the workers. Employers who thus spend large sums of money for such a purpose have their reward in the increased health and vigour of their workpeople, and the improved capacity of the latter for producing good work.

In railway workshops and the like, large galvanised steel trunks run along a little above the springing of the roof, with outlets at regular distances. Fresh air (warmed in winter) is driven by a centrifugal fan through these trunks, and is thus distributed throughout the building. The outlets for the air generally consist of a number of large open doors. This air is generally distributed at high velocities.

Where there are large quantities of steam given off in workshops and factories, its removal cannot be effected by currents of cold air. The air blown in for this purpose must be warmed, at all events in winter.

Methods of Warming.

When we come to deal with the methods of warming buildings, we find that these will vary with the system of ventilation. With the simplest form of natural ventilation we have the open fire, that extravagant, much abused, but really cheerful and healthful method. For the rooms only in a public building they are still the most comfortable and wholesome form of warming, and form excellent extraction ventilators, provided always that there are suitable air inlets, such as Tobin's tubes or partially open windows. No system of artificial or mechanical warming and ventilation will ever be as wholesome and comfortable for such a purpose. This refers to single rooms and offices, and not large general offices, where a good number of persons are congregated, and where open fireplaces would be inconvenient and out of place.

Hot Water and Steam Radiators.

Leaving the subject of open fireplaces, we come to artificial warming, and the first is direct heating by hot water or steam radiators, which in some systems of natural ventilation take the place of open fireplaces. Great improvements have, in the past few years, been made in the various types of radiators, most of the improvements emanating from America; the heating surfaces have been better designed and their efficiency thereby increased. Whenever possible the radiators should be placed against an external wall, so that an air channel can be formed at the back, and in all cases, whether against an inner or outer wall, a baffle should be fixed to the wall immediately above the radiator to prevent the deposit of blacks and dust upon the wall above, caused by the convection air currents set up. Swinging radiators are very convenient for access to the wall for cleaning purposes, but these are somewhat costly. They should, however, always be used for hospital work. It is preferable, in all cases, for the radiator to stand on wall brackets and not on feet, so as to leave the floor clear for cleansing purposes. The inlet and outlet branches to and from the radiator should each have a valve, in order that any radiator can be removed without disturbing the general circulation.

Exposed or "direct" radiators heat both by radiation and convection, but principally by the latter, and the efficiency of the heating surface is considerably increased by fresh air currents passing across them. The freer the circulation of air round the surfaces of the radiator the higher is the efficiency and for this reason, low radiators are more effective than high ones, and single column radiators than those with two or three columns. There should, therefore, be a good air space between the loops. Ribs or other like extensions of the heating surfaces are of little value, at all events in hot water radiators. It is necessary to paint radiators, and it has been found that bright and glossy paints reduce the amount of radiation, and that a dull, dark paint is preferable. The colour or brightness of the paint does not, however, affect the convected heat. The best position for a direct radiator is under a window, as being the part of the room with the most cold currents of air.

When radiators are used in connection with authorised inlets in an extraction system of ventilation, the incoming air is generally required to have an upward current. It is not a good arrangement to enclose these radiators in iron cases, as there are difficulties in cleaning the interior. It will be sufficient if removable baffles are fitted to the front of the radiator for about two-thirds of its height. This will give the requisite direction of the air.

Wherever radiators are used, whether for direct or indirect heating, the temperature should not exceed 150 degrees for the reasons already given.

When the warming is in connection with the plenum system, it is not desirable in many cases to make the incoming air the sole source of means of warming, as in most cases this would necessitate undue heating of the air. It is preferable to admit the air at a temperature not exceedingly 10 degrees or 15 degrees above the required temperature of the room,, and to supplement this by direct heating by means of radiators.

Means of Heating.

As to the medium to be used for creating the required temperature in the radiators, pipes, or batteries, we have live steam, exhaust steam, and hot water. High-pressure steam is a costly medium, as its latent heat is less than that of low-pressure steam, and the latter is, therefore, more generally used. When exhaust steam is available this is still more economical, as it is to some extent frequently a waste product, but this is only available when there is steam power of some kind on the premises. There are two systems of hot-water heating, viz., high pressure and low-pressure. The high-pressure system, commonly called Perkin's system, is a sealed circulating apparatus in which the water is heated to a temperature of 350 degrees, with a pressure of 135lbs. on the square inch. Small pipes are necessarily used. It is a convenient method of heating in some cases, but from our point of view the high temperature of the heating surfaces is a fatal defect. This system is not very generally used in these days. Low-pressure hot water gravity circulation is very simple and effective, as it supplies its own motive power for the purpose of circulation, and low temperatures can be obtained for the heating surfaces. Low-pressure hot water gravity circulation is of two kinds, the one pipe and the two-pipe systems. As its name indicates, the two-pipe system has a flow and return in separate pipes to each circulation, the branch inlet to the radiator leading from the flow pipe, and the outlet leading to the return pipe. In the one-pipe system the inlet and outlet branches from the radiators lead from the same pipe, which is a flow-pipe so long as it is feeding the radiators, after which it returns to the boiler. This system is by far the simplest and most effective, and is free from the danger of short circuiting to which the two-pipe system is very liable. As, however, in the one-pipe system, the hot water having done duty in the radiator, returns somewhat cooler to the same flow pipe (and the radiators may be numerous), the tendency is for the water in the flow-pipe to become a little cooler, and to meet this difficulty the heating surfaces of the further radiators should be proportionately increased.

Separate Circulation to Each Floor.

Where there are several floors to a building there should be a separate circulation to each floor leading from two large drums, one for the flow and one for the return, these drums being in circulation with the boiler. A valve placed on each flow-pipe close to the drum will admit of the necessary regulation of flow, so that one floor shall not get a better circulation than another. In all gravity circulations great care must be taken in the matter of air pipes, otherwise trouble may ensue. The overhead or drop system is practically the one-pipe system with descending instead of ascending branches. It is useful in many positions where the other systems would be unsuitable.

Whatever the system of circulating adopted one matter should be borne in mind, viz., that any circulating or branch pipe which is not doing duty, either by radiation or convection, should be coated with a good non-conducting composition, so as to prevent loss of heat.

To surmount the difficulties arising to the circulation from dips and other obstacles, and for other good reasons, several ingenious apparatuses have been designed to force the circulation, three of which I will describe. In these cases pipes of smaller diameter can be used. It must, however, always be remembered that these generally require motive power of some kind, to be represented by steam power or electric motors, and that this has to be paid for in annual cost.

System of Warming.

In the Pulsia' system the hot water is circulated compulsorily in continuous pulsations, the water in an ordinary water boiler being brought to boiling point, and rising in a pipe taken from a boiler is converted into steam, which is used for displacing a body of water in two cylindrical vessels, forming part of the apparatus, and placed in a certain relationship to the supply tank. An arrangement of "syphon" pipe in one displacer is used as a cut-off for the steam in such a manner as to cause alternative displacement of water, condensation of steam, and consequent refilling of the displacers with water. The whole of the circulating pipes, radiators, boiler and pulsial displacers, form one connected open-bore system, under atmospheric pressure. No sunk boiler-room is required, and pipes of small diameter are used. The apparatus is noiseless, and admits of any desired temperature of the circulating water being regulated, from a low temperature to a high one. It will be noted that no independent steam supply is required, the steam used being generated in the apparatus itself.

The Cable system is automatic, using very small pipes, and is a self-contained system without pumps, working with a boiler pressure as low as 1½lbs., or with exhaust steam only. The most important part of the apparatus is a thermo-syphoniser, in which condensation of the steam causes a powerful suction on the return pipe, which draws the water round the system at a high velocity. The boiler can be placed at any level, provided it is at a certain minimum distance below the expansion tank, and basement excavation can be thus avoided. The circulating pipes, flow and return, can be run from the apparatus in any direction up or down, and at any desired level. The temperature of the circulating water is automatically regulated.

The Turbo system consists of a Turbo accelerator, driven by an electric motor, taking ¼ h.p. for the small, and ½ h.p. for all but the larger sizes. It is practically a forced circulation, and thus independent of levels and of dips, and other obstacles, and admits of the circulating pipes being small. It can be easily adapted to existing circulations.

There is also the ordinary system of forced circulation, suitable for large hospitals and other institutions, where there are several detached buildings on the site. For this purpose there is a central heating chamber, preferably close to the boiler-house, in which the water is heated in large steam heaters, from whence it is pumped along circulating pipes in subways at a velocity of from 3 to 4ft. per second, to the several buildings, with branch gravity circulations into each building. These forced circulations can with advantage be arranged in the method of ring mains, i.e., two pipes running round the group of buildings, and thus forming a ring, each pipe starting from the heater and going in the opposite direction, and then returning to the heater. Each circulation starts as a flow-pipe and runs as such for half the journey, when it becomes a return pipe. Thus a fair equality of flow temperature is maintained throughout the ring. But there is another great advantage arising out of this arrangement. The two rings are connected by cross pieces and three-way valves, so that any part of the system can be shut down for repairs, leaving the whole of the remainder of the system in circulation. Care must be taken to provide a sufficient number of expansion joints in these mains. Exhaust steam from the pumps and engines is used in the heaters supplemented, as may be necessary, by low-pressure, live steam. It is prudent to have a spare heater, and the pumps in duplicate. This arrangement of a central heater chamber is much more convenient than having steam heaters in each building, and saves labour on the part of the staff. I wish to emphasise the importance of having the circulating pumps of ample size, in order that the circulation may be efficient without forcing the pumps. This has not always been done with these installations. This question of a comfortable margin of power equally applies to all other parts of a heating apparatus, whether boilers, circulating pipes, or heating surfaces.

Steam Heating.

As regards steam heating, I may mention the Webster vacuum system, and the Nuvacuumette system, both of which deal primarily with exhaust steam.

The Webster vacuum system uses exhaust steam supplemented as occasion may require by live steam. The exhaust pipe from the engine passes through an oil separator, and is carried through a system of distributing mains to the several radiators, which system can be upward or downward, according to the nature of the building. Each radiator has two valves, the outlet or return end of the radiator having an automatic valve designed to prevent the escape of steam into the return main, while freely permitting the discharge of air and water thereto. The return mains lead to a vacuum pump, having first passed through a suction strainer and condenser head for removing any chips or scale that might otherwise enter the pump. The vacuum pump discharges to an air-separating tank, from which the water passes through a sealed discharge pipe to the feed pump. The speed of the vacuum pump is automatically controlled by a vacuum governor, which can be set to maintain any degree of vacuum in the return mains. Low pressure live steam can also be used with this apparatus.

The Nuvacuumette system is upon somewhat similar lines, but with one important difference. The automatic valves controlling the steam supply to the radiators are placed on the inlets, but the return or condense outlets from the radiators have no valve, and are open to the condense main. Thus the vacuum in the condense main extends into the radiators, the radiators being under the same absolute pressure as the condense main. By this arrangement the temperature of the radiator can be regulated by the vacuum maintained. With the usual vacuum of 10ins. the temperature of the steam would be 193 degrees, and this can be lowered to 170 degrees by increasing the vacuum to 18ins. Thus a fairly low temperature can be obtained for the heating surfaces, although not so low as in hot-water apparatus.

There are many public buildings where no steam is required for any other purpose, and in such cases hot-water heating is preferable, as a hot-water circulating boiler requires very little attention, whereas steam boilers require the skilled attention of an engineer.

On the other hand, in the case of factories where there will be a good deal of steam-driven machinery, the heating medium will generally be steam, as there will be a large quantity of exhaust steam available, for which, in many cases, there would be no other use. In the cases of one-storey factories with roofs on the factory or saw-tooth system, the heating is effected by steampipes running just below the springing of the roof. This prevents undue cooling of the air by the open roof and glass.

In calculating the necessary amount of heating surface in batteries, radiators, or pipes, regard must be had to, and allowance must be made for, not only the amount of incoming air which has to be warmed, but also to the loss of heat from walls, windows, ceilings, floors, or open roofs; and a further allowance must be made for exposed positions and a northern aspect. Allowance must also be made in those cases where the heating apparatus is closed down during the night, during which period the external walls will have cooled down. The loss of heat from these sources is considerable, and in some cases amount to almost as many units of heat as are required for the purpose of warming the whole of the incoming air.

It is essential that the amount of heating surface should be such that the building can be quickly warmed in the morning, not only for convenience, but as a matter of economy in fuel. It is cheaper to get the heat up in building in a short time than to have to continue the process for three or four hours.

In conclusion, I have to point out that the cost of working ventilation and warming apparatus should be considered when they are designed, so as to avoid undue expenditure of power in mechanical ventilation, and excessive consumption of fuel in connection with warming apparatus, the latter being a matter of the utmost importance.

SOME IMPORTANT LEGAL DECISIONS IN 1909.

By a Barrister-at-Law.

Near the commencement of a new year it is not unprofitable to glance at the development of the law relating to building which has taken place during the last twelve months. Strangely enough, there is but little to be found in the statute book for 1909 which is of especial interest to builders. Nor do the law reports supply a very plentiful crop of cases which closely affect the builder or the building owner. For the most part the cases which have a remote connection with building relate more particularly to building by-laws.

It is proposed to consider a few of the leading cases reported in the "Times Law Reports" and the "Justice of the Peace" during the past year.

Arbitration.—Among cases relative to arbitration one may be mentioned as being of interest to the engineer who is asked to act as arbitrator. A dispute having arisen between two persons, A and B, each of them appointed an arbitrator, and the arbitrators appointed an umpire. The umpire made an award in favour of A, and directed B to pay the fees of A's arbitrator. B having refused to do this, the arbitrator brought an action to compel him to pay them. It was held that although he was not appointed arbitrator by the defendants, the defendants were bound to pay the fees, as there was an implied promise to pay the arbitrators and the umpire for their services.

The Preparation of a Tender.—Another case illustrates the great care which should be exercised in preparing a tender, especially where it is made to a local authority. In *Johnson v. Islington Union*, 73 J.P. 172, the plaintiff saw an advertisement in a newspaper inviting tenders for the supply of certain goods required by a board of guardians. He tendered on a printed form supplied by the guardians for the supply of a certain disinfectant manufactured by him. The tender was accompanied by a sample of the disinfectant labelled "Anite," which was delivered to an officer of the defendants. On the printed tender the defendants had asked for a tender for "Heydozone," and the plaintiff omitted to alter the word "Heydozone" into the word "Anite" on the tender, so as to make the tender agree with the label on the sample delivered. The defendants accepted the tender of the plaintiff for the supply of "Heydozone."

The Local Government Board require that the tender form supplied by the guardians should be in a prescribed form under an Order dated December 31st, 1877. The tender supplied to the plaintiff varied in certain respects from this prescribed form. It was held, on the facts, that the plaintiff had failed to show that the minds of the two contracting parties were not *ad idem*, or that the defendants had misled him in any way, and that consequently the contract was binding on him.

Right to Claim for Extras.—Many a contractor would be willing, after the work is done, to tear up his agreement, and claim for what he had done, as upon a *quantum meruit*. It is not easy to foresee the contingencies which are likely to arise in carrying on the work. In *Jackson v. Romford R.D.C.*, 73 J.P. 248, the plaintiff contracted to carry out sewerage works for the defendant council. In consequence of orders, the work was varied, and rendered much more expensive. The plaintiff claimed to be entitled to payment as on a *quantum meruit*, based on the cost and value of the work. It was held that he was only entitled to be paid on the basis of the contract price together with extras. It also appeared that the engineer had given no final certificate, and that many of the extras were not ordered in writing. In these circumstances it was held that the referee could deal with the extras on their merits.

Restriction Covenant in Architect's Agreement.—The force and effect of a "restriction covenant" has occasionally to be considered by architects when entering into agreements. *Prima facie* a restriction covenant, that is to say, an agreement which prevents a man exercising his calling, is illegal and void as being against public policy; but it is obvious that the sale or purchase of a goodwill would be impossible if some reasonable restriction were not allowed. In one case (*Robertson v. Wilmott*, 25 T.L.R. 681), decided by Mr. Justice Warrington, the question arose as to what is meant by practising as an architect or surveyor. The defendant covenanted not to practise as an architect or surveyor within a defined area for a number of years. It was held that he committed a breach of that covenant by acting as manager at a fixed salary to another architect.

Restrictive Covenants as to Building.—There is another class of restrictive covenant of considerable interest to builders and building owners, namely, covenants which restrict the class of buildings which may be erected on land. In a somewhat complicated case (*Powell v. Hemsley*, 25 T.L.R. 649), decided by the Court of Appeal, it appeared that the defendant bought certain land, part of an estate which was subject to a covenant that only houses of a certain character should be built upon it. He leased a portion of the land, and the lessee built a house which did not conform to the covenant, without obtaining the consent of the original vendor. The lease having come into the hands of a trustee, who disclaimed it, the defendant went into possession. Subsequently the plaintiff bought the whole estate from the original vendor with the benefit of all covenants. He sued the defendant for the breach, and asked for an order that the houses already built might be pulled down. The Court of Appeal held (1) that the covenant was broken once for all when the houses were built contrary to it; (2) that there was no evidence that the defendant had encouraged or formulated the breach so as to make him liable for it; and (3) that the plaintiff had no rights in respect of breaches committed before he purchased.

Meaning of the Term "Building."—In the domain of local government law, there are several decisions of interest to builders. Thus, the meaning of "building" has been considered more than once. In one case (*Haurchan v. Leigh U.D.C.*, 25 T.L.R. 540), a man who converted a railway carriage into a dwelling was held to have constructed a "new building" within the meaning of the Public Health Act, 1875, S. 159, which, as it did not comply with the by-laws, the local authority were justified in pulling down. In another case it was held that two covered-in reservoirs of a combined capacity of about 6,000,000 cubic feet, constructed by the Metropolitan Water Board, were "buildings." The result of this was that the district surveyor was entitled to fees under the by-laws and the London Building Act, 1894, for surveying the reservoirs (*Moran v. Marsland*, 25 T.L.R. 235).

Liability for Not Depositing Plans in Compliance With By-law.—The question, Who is liable? becomes very important when the duty of complying with a sanitary notice

Photo: T. Lewis.

DETAIL VIEW OF THE ASHTON MEMORIAL, LANCASTER. JOHN BELCHER, R.A., ARCHITECT.

This magnificent pavilion, which was erected in the Williamson Park, Lancaster, was a gift of Lord Ashton to the town of Lancaster.

is entrusted to a builder or a plumber. In *Kershaw v. Brooks*, 13 J.P. 231, a plumber was employed by a house owner to execute certain sanitary repairs. The work was done by the son of the plumber, but no plans were deposited as required by the by-laws. The plumber was summoned for penalties. It was held that as there was nothing to show that he was not merely carrying out the orders of the house owner, he could not be convicted. Seeing that builders and sewerage contractors are often entrusted with the work of complying with sanitary notices, it is worth while to notice that where the owner of property adjoining a private street is called upon to sewer, level, and pave the street, certain formalities must be complied with. Thus the notice must contain specific reference to the deposited plans of the structural work intended to be executed (*Stourbridge U.D.C. v. Butler*, 25 T.L.R. 24).

Liability for Extraordinary Traffic.—"Extraordinary traffic" on highways is often a source of trouble and vexation to builders and contractors. The local authority may recover the expense incurred in putting a highway right after there has been such traffic; but where work has been done under a particular building contract, they must take proceedings not less than six months after the completion of the contract or work. In the case of *Carlisle R.D.C. v. Carlisle Corporation*, 1909, 73 J.P. 121, it was held that the term "building contract" means a contract for the building of any physical construction, and that the term "the completion of the contract" means completion so far as regards the constructional work comprised therein; and that where the constructional work consists of several component parts so closely connected that each would be useless without the others, the period of six months begins to run from the completion of the whole work, notwithstanding that the damage to the roads may have been caused exclusively by the haulage of materials in connection with some or one only of the component parts of the work.

Mr. B. T. Batsford has taken over from Messrs. George Newnes, Ltd., the remaining stock of Mr. Baillie-Scott's volume "Houses and Gardens," and has reduced the selling price from £1 11s. 6s. to 18s. net.

* * *

Messrs. Pepler and Allen, architects, surveyors, and estate agents, late of 3, George Street, Croydon, and 37, Queen Victoria Street, E.C., have taken over the practice of Mr. Thomas Adams, land agent and surveyor, 3, Pall Mall East, London, S.W., Mr. Adams having been appointed to organise the new Town Planning Department at the Local Government Board. Messrs. Pepler and Allen have moved their offices to 3, Pall Mall East. Telephone, 637 Central, and telegrams, "Rusinurbe, London."

ARCHITECTS OF THE DAY.

In addition to the list of works designed by Mr. P. Morley Horder, given in our issue of January 26, the following (which were received too late for inclusion) may also be mentioned:—Houses at Milford Haven and Denbigh, Wales; house near Liverpool; alterations to Garboldisham Manor and house at Garboldisham, Norfolk; Parish Halls at Pitsford, Northants, and Luton, Beds.; alterations and decorations to house at Kensington Palace Gardens, and houses in Brook Street, and business premises in the City and West End, London; house at Wendover, Gerrards Cross, and Beaconsfield, Bucks; houses at Compton, Surbiton, Upper Warlingham, and Redhill, Surrey; houses near Bramdean, at Hambledon, and Milford-on-Sea, Hants; houses at Tunbridge Wells and Langton, and cottage at Speldhurst, Kent; houses at Forest Row, and Lindfield, Sussex; 2 houses at Cheltenham, alterations and decorations at Farm Hill Park, Stroud, and at Rodborough Court, Stroud, Glos.; churches at Muswell Hill, Leyton, Bowes Park, Hackney, Westcliffe-on-Sea, also additions and decorations to church at Thurso, N.B., Rodborough, and various mission churches.

ROBERT ADAMS,

(Gearing and Door Spring Patentee and Manufacturer)

Specialist for the COMPLETE EQUIPMENT OF DOORS AND WINDOWS.

3 & 5, EMERALD STREET, LONDON, W.C. — 15 — Gold Medals.

The New "Shallow Victor" patent Double-Action Spring Hinge, pattern No. 22.

MEN WHO RISE

to-day are not those who wait for their seniors to go, but those who displace their seniors by obtaining higher technical knowledge of their work in their spare time.

The International Correspondence Schools place this higher, better-paid knowledge at **your** disposal—in your present work or any other vocation you may desire. All is done by correspondence so that you can study when and where and as secretly as you like.

By this means, every day, workmen are taking foremen's positions, clerks are becoming managers, employed are becoming employers.

For example, Student J. Such writes:—

"I am writing to inform you I have obtained **through the 'persistence' of your local Representative, a berth at a large Electrical Manufacturing Company, at an increase of 25%** on my salary and overtime. The gentleman who gave me the berth is himself an I.C.S. student, and thus I attribute my securing this new position solely to the I.C.S."

LET US REFER YOU TO SUCCESSFUL I.C.S. STUDENTS IN YOUR DISTRICT.

Tell us the line of work in which you are interested and by return we will send you, without charge or obligation, full particulars of the suitable I.C.S. Course and a list of the Faculty Officers and Experts whose brains and experience we place at your convenience. Start now by writing now.

Special Annual Issue of "THE ARCHITECTURAL REVIEW."

"Recent English Domestic Architecture," 1909.

PRICE **5/-** NETT.

THROUGHOUT the domain of Architecture, English Domestic Work is of acknowledged supremacy. It is the admiration of all countries, and is one product, at least, in which British Architects hold undisputed pre-eminence. The Domestic Work designed during the past few years by our leading Architects has shown progressive volume and interest, and this continuous development has coincided with and has, no doubt, greatly encouraged a remarkable growth of artistic taste among the laity, as well as in the Architectural Profession.

Month by month, specimens of noteworthy Domestic Work are shown in "THE ARCHITECTURAL REVIEW"; but necessarily only a limited number of examples can be represented through that medium.

The Publishers have much pleasure in announcing that the above Special Issue is now ready. It comprises a collection of choice examples of Recent Domestic Work by Architects who have achieved distinction in this class of design. The examples are not restricted to any particular school or style, intrinsic merit being the only test.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about **five days** or longer after the date of this issue.
Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders.
The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the Contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Feb. 3—15. **ERDINGTON.**—Erection of a house for the Master of the Workhouse at Erdington, for Aston Union. Persons desirous to tender are invited to send their names and addresses by 3rd instant to John North, Clerk to the Guardians, Union Offices, Vauxhall Road, Birmingham, to whom tenders are to be sent. Drawings and specification can be inspected at the office of Whitwell and Son, Architects, 3, Newhall Street, Birmingham. Copies of quantities and forms of tender will be sent to applicants on deposit of £5 with the Architects. Fair wages clause.

Feb. 4—25. **BELLSHILL (Lanark).**—Erection of buildings to contain refuse destructor; also steel chimney stack; provision of water supply and drainage, and formation of access road and other relative works at Boggs Brae, near Bellshill, for the C.C. Plans may be seen, and copies of specification and schedule of measurement obtained at the office of W. L. Douglass, C.E., District Engineer, District Offices, Hamilton, on deposit of £1. An assistant engineer will meet intending contractors at Bothwell Bridge at 10.20 a.m., on Feb. 4. Tenders must be lodged with the Clerk to the Local Sub-Committee, James Forsyth, the Cross, Bellshill.

Feb. 9. **WAKEFIELD.**—Erection of a lodge on the St. John's Estate, for the Governors of the Wakefield Charities. Names of those desirous of tendering should be sent to W. Wrigley, A.R.I.B.A., Architect, 2, King Street, Wakefield, when quantities will be supplied.

Feb. 14. **YARMOUTH.**—Erection of fishing premises, South Denes. Plans and specifications may be seen, and bills of quantities obtained, upon application to Chas. G. Baker, Architect, Town Hall Chambers, to whom tenders are to be sent.

Feb. 14. **PORTHCAWL.**—Erection of a new post office, at Porthcawl. Plans, etc., can be seen, and quantities obtained by deposit of £1 1s., of John H. Phillips, F.R.I.B.A., 7, Pembroke Terrace, Cardiff, to whom tenders are to be sent.

Feb. 14. **ROYAL LEAMINGTON SPA.**—Pulling down existing cooling room, clearing site, and erecting new annexe to the pump room, with basement, for the Corporation. Drawings, specifications, and conditions may be seen at the office of the Architects, Quick and Lee, The Parade. Tenders must reach Leo. Rawlinson, Town Clerk.

Feb. 14. **COVENTRY.**—Alterations and additions to workshops at City Works, comprising one-storey workshop, 95ft. long by 33ft. wide, for the Corporation. Drawings may be seen and specification, with form of tender and bill of quantities obtained on deposit of £1 1s. Tenders to be addressed to the Chairman of the Gas Committee, Gas Works, Coventry.

Feb. 14. **SOUTH SHIELDS.**—Formation of the forecourt of the municipal buildings, for the Corporation. A copy of the quantities and specifications and form of tender may be obtained on application to the undersigned, also drawings and form of contract inspected, at the office of the Architect, E. E. Fetch, A.R.I.B.A., 20, St. John Street, Adelphi, London, W.C. Tenders to be delivered to Moore Hayton, Town Clerk, Court Buildings, South Shields.

Feb. 15. **GOLCAR.**—Persons desirous of tendering for the various trades required in the erection of two semi-detached residences in Scarhouse Lane, Golcar, can inspect plans and obtain quantities of Arthur Shaw, Architect, Golcar.

Feb. 15. **MARSH.**—Erection of one dwelling-house, Luck Lane, Marsh (all works except mason's). Plans may be seen and quantities obtained of Lunn and Kaye, Architects and Surveyors, Milnsbridge and Huddersfield, to whom tenders are to be sent.

Feb. 15. **BURTON-UPON-TRENT.**—Erection of new water closets and alterations at Grange Street school, for the Corporation. Plans may be seen and bills of quantities obtained at the Education Offices, Guild Street. Tenders must be sent to H. Bence, Secretary and Director of Education, Education Offices. Fair wages clause.

Feb. 15. **KINSALE.**—Erection of cottages in accordance with the plan and specification to be seen at the Council office, for the R.D.C. A deposit of £2 per cottage must be lodged with each tender, and a receipt obtained from the Clerk. Tenders for fencing plots, and for additions to and repair of existing cottages will also be considered. Schedules of cottages and plots, conditions of contract, and any other particulars, can be had on application to John Murphy, Clerk of Council, Council Office, Kinsale Workhouse.

Feb. 15. **DURHAM.**—Erection of new Council schools at Usworth Colliery, Castletown, and New Lambton (Fence Houses); extensions at Eldon Lane Council school, for the C.C. Plans, specifications, and general conditions of contract may be seen, and bills of quantities obtained as follows:—1, Usworth Colliery, Castletown, and New Lambton schools, at the office of W. Rushworth, Shire Hall, Durham; 2, extensions at Eldon Lane school, at the office of F. E. Coates, Shire Hall, Durham. Tenders to be sent to J. Dawson, Clerk to the Education Committee, Shire Hall, Durham.

Feb. 16. **HOMERTON, N.E.**—Erection of pavilion "C" at the Infirmary at Homerton, N.E., for the Hackney Union. Applications for bills of quantities and forms of tender should be made, accompanied by a deposit of £5, before Jan. 31, to Frank R. Coles, Clerk to the Guardians, to whom tenders are to be sent. The contractor will be required to give approved security. The form of bond and plans may be seen at the Guardians' Office, Sidney Road, Homerton, N.E.

Feb. 16. **BOCKING.**—Erection of a new boiler house, sorting room, and other alterations to the laundry and kitchen at the Union Workhouse, Bocking, for the Braintree Union. Names to be sent to J. W. Start, F.S.I., Architect, Colchester, enclosing deposit of £2 2s. Bills of quantities will be forwarded. Drawings can be inspected at the Union Workhouse, Bocking, or at the office of the architect. Tenders must be sent to Alfred Hills, Clerk, Union Offices, Bocking.

Feb. 16. **GWAUNCAEGURWEN.**—Completing the erection of the Siloh Methodist Chapel, Gwauncaegurwen. Plans and specification can be seen with W. J. Hadley, Frondeg, Coelbren Road, Gwauncaegurwen. Tenders to be sent to D. T. Sims, J.P., Rock-Field, Neath. Further particulars may be obtained from the Architect, Arthur S. Williams, M.S.A., Llandilo.

Feb. 16. **NEWPORT (Mon.).**—Re-covering with zinc or copper part of the roof of the general markets, for the Corporation. The portion to be dealt with has an area of about 8,200 superficial feet. A sectional drawing of the roof, together with general specification, may be obtained from R. H. Haynes, Borough Engineer, on production of a receipt from the Borough Treasurer for £1 1s. Tenders to be forwarded to the Town Clerk, Town Hall, Newport. Fair wages clause.

Feb. 18. **LINTHWAITE.**—Erection of twelve dwelling-houses, Manchester Road, Linthwaite. Plans may be seen and quantities obtained of Lunn and Kaye, Architects and Surveyors, Milnsbridge and Huddersfield, to whom tenders are to be sent.

Feb. 18. **PUTNEY.**—Erection of Putney telephone exchange, for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to J. Rutherford, H.M. Office of Works, Carlisle Place, S.W. Bills of quantities and forms of tender may be obtained at the undermentioned address on deposit of £1 1s. Tenders must be delivered to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

Feb. 18. **BINGLEY.**—Alterations and additions to Wilsden Provided School, for the West Riding Education Committee (builder, joiner, slater, plumber, plasterer, and painter). Plans may be seen and specifications with quantities obtained on application to the Education Architect, County Hall, Wakefield. £1 deposit must be sent by separate letter to the West Riding Treasurer, County Hall, Wakefield. Tenders to be sent to Francis Alvey Darwin, Clerk of the County Council, County Hall, Wakefield.

Feb. 18. **BIRMINGHAM.**—Erection of Hockley Hill new branch post office, Birmingham, for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and conditions, and form of contract may be seen on application to J. Tosh, H.M. Office of Works, General Post Office, Birmingham. Bills of quantities and forms of tender may be obtained at the undermentioned address on deposit of £1 1s. Tenders must be delivered to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

Feb. 18. **BRADFIELD.**—Execution of the following works for the West Riding Education Committee:—Bradfield: Loxley New School—builder, joiner, slater, plumber, plasterer, and painter. Plans may be seen and specifications with quantities obtained on application to the Education Architect, County Hall, Wakefield. A deposit of £1 in each case must be sent by separate letter to the West Riding Treasurer, County Hall, Wakefield. Tenders to be sent to Francis Alvey Darwin, Clerk of the County Council, County Hall, Wakefield.

Feb. 19. **LONDONDERRY.**—Separate tenders will be received by Rev. W. B. MacFeely, B.D., Adm., St. Eugene's Presbytery, Londonderry, for erection of St. Eugene's Boys' National School, Rosemount, Londonderry, and for plumbing, heating (by low pressure hot water), and electric light fitting at same, according to plans and specifications to be seen at the office of Edward J. Toye, Architect, Northern Gate, Londonderry, where quantities, also plans and particulars of plumbing, heating, and electric work, may be obtained on deposit of £1 each.

Feb. 21. **WATERLOO WITH SEAFORTH.**—Erection of the Rawson Road Council School, Seaforth, near Liverpool, for the U.D.C. Bills of quantities may be obtained from the undersigned upon deposit of £1 1s. Drawings and specifications may be seen at the office of Appleyard and Quiggin, Architects, No. 67, Lord Street, Liverpool. Tenders must be delivered to John I. Thompson, Clerk to the Council, Town Hall, Waterloo, near Liverpool.

Feb. 22. **EDINBURGH.**—Raising existing car sheds, roofs, etc., at Henderson Row Cable Power Station for the Corporation. Specification and form of tender may be obtained from J. Walker Smith, Burgh Engineer, on deposit of £2 2s. by crossed cheque payable to Town Clerk. Tenders must be lodged with Thomas Hunter, W.S., Town Clerk, City Chambers, Edinburgh.

Feb. 22. **HANDSWORTH (Birmingham).**—Erection of a new station at Handsworth, Birmingham, for the Great Western Railway. Plans and specification may be seen and forms of tender and bills of quantities obtained at the office of the New Works Engineer, at Paddington Station. Tenders to be sent to G. K. Mills, Secretary, Paddington Station, London.

Feb. 22. **KELSO.**—Erection of a new post office at Kelso, for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and conditions and form of contract, may be seen on application to the Postmaster of Kelso. Sketch plans may be seen and bills of quantities and forms of tender obtained at H.M. Office of Works, Parliament Square, Edinburgh, on deposit of £1 1s. Tenders must be delivered to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

Feb. 23. **CLIFFORD (near Hay).**—Additions and alterations to the Council School, at Clifford, near Hay, for the Herefordshire County Council. Plans and specifications may be seen and bills of quantities and form of tender obtained at the office of the County Surveyor, Shirehall, Hereford, on deposit of £1 1s. Tenders to be delivered to John Wiltshire, County Education Secretary, Education Office, Shirehall, Hereford.

Feb. 23. **CARDIFF.**—Erection of (1) proposed gun sheds and stores in Dumfries Place, Cardiff, for the Royal Field Artillery, and (2) carrying out extensive repairs and renovations to the drill hall buildings, Dumfries Place, Cardiff. Plans and specification may be inspected at the office of the Architect, W. H. Dashwood Caple, F.R.I.B.A., 2, Church Street, Cardiff, who will supply copies of the bills of quantities and schedules of dilapidations on deposit of £1 1s. each. Application for quantities and schedules to be made by 9th inst. Tenders to be delivered to Capt. C. Wilkie, Secretary, 20, Dumfries Place, Cardiff.

Feb. 25. **ST. DENNIS (Cornwall).**—Erection of a dwelling-house and shops at Fore Street, St. Dennis, for T. Varcoe. Drawings and specification may be seen at the office of B. C. Andrew, M.S.A., Architect, Biddock's Court, St. Austell, to whom tenders are to be sent.

Feb. 28.— **MERTHYR TYDFIL.**—Erection of twenty-two terrace houses in three blocks and six pairs of semi-detached villas, together with the construction of roads, sewers, and surface water drains, on the Meyrick Estate, Gwaelodygarth Field, Merthyr Tydfil, for the Grove Building Club. Drawings and specifications can be seen and forms of tender obtained at the office of T. Edmund Rees, Architect and Surveyor, Merthyr Tydfil. Tenders to be sent to Martin Evans, Solicitor, High Street, Merthyr Tydfil.

Feb. 28. **DARTFORD.**—Construction of an open-air swimming bath, for the U.D.C., in accordance with plans and specification, which may be seen at the office of the Surveyor, Council Offices, Dartford. Tenders must be delivered to W. Kay, clerk, Council Offices, Dartford.

March 5. **NEW ROSS.**—Sanitation and alteration to Workhouse, comprising:—1, drainage and water supply; 2, erection and completion of sanitary annexes, etc.; 3, plumbing and hot water circulation; 4, erection of a new kitchen and annexe at the fever hospital, for the Union. Plans and specifications may be seen at the Boardroom, New Ross, and at the office of the Architect, J. A. Ryan, 33, Catherine Street, Waterford. Forms of tender are to be obtained from P. A. Pope, Clerk of the Union, New Ross, to whom tenders are to be sent.

No date. **EAST HAM.**—Execution of building and decorative repairs to the schools, for the Corporation. Specifications will be supplied to the persons or firms approved by the Committee, who furnish their names and addresses to H. C. Padgett, Secretary, Education Office, East Ham, E.

No date. **BRADFORD.**—Persons desirous of tendering for the whole or part of works, pulling down excavating, and foundation work to premises, market street, and Booth Street, Bradford, for the Bradford District Bank, Ltd. (first contract), are requested to forward their names, together with deposit of £1 1s., to the Architects, Carby Hall and Dalby, Prudential Buildings, Park Row, Leeds.

ENGINEERING

Feb. 15. **WITHAM (Essex).**—Installation of a new vertical steam boiler and shed at the Bridge Industrial Home, Witham, Essex, for the Metropolitan Asylums Board. Drawings, conditions of contract, specification, and form of tender may be inspected at the office of the Board, Embankment, London, E.C., can be obtained upon deposit of £1. Tenders must be delivered at the office of the Board.

Feb. 15. **TORONTO, CANADA.**—Execution of the following work and supply of materials:—3, laying sewer outlet; 4, building sewage tanks; 5, supply of iron castings; 7, supply of structural steel; 7, supply of sludge valves, penstocks, and pedestals; 8, supply of cast-iron pipe; 9, supply of cranes; 10, supply of special tile. Plans may be seen and specifications obtained at the Office of the City Engineer, Toronto, and at the office of the Commercial Intelligence Branch of His Majesty's Board of Trade, 73, Basinghall Street, London, E.C. Specifications may also be seen at the office of Mr. Farnell, 11, Charing Cross Mansions, Glasgow. Tenders by registered post to be sent to Joseph Oliver (Mayor), Chairman, Board of Control, City Hall, Toronto.

Feb. 16. **SHEERNESS.**—Supplying and fitting heating arrangements, for the Sheppey Union. A committee will meet intending contractors at the workhouse by appointment. Letters to be sent to the Master, Sheppey Union, Minster, near Sheerness.

Feb. 16. **OLDHAM.**—Supply, delivery, and erection, at the Hollinwood Depot, for the Corporation:—1, electric lighting, etc., installation; 2, switchboard and accessories; 3, testing panel and accessories; 4, workshop motors, with starting panels; pulleys, and slide-rails, etc., complete. Duplicate copies may be had on payment of 10s. 6d., which will not be returned. Tenders must be delivered at the offices of the above-named. J. H. Hallsworth, Town Clerk. Fair wages clause.

Feb. 18. **CELBRIDGE NO. 2.**—Sinking and walling a well and erection of a pump at Brittas, Co. Dublin, in accordance with specification prepared by J. J. Inglis, C.E., a copy of which will be forwarded, on application to F. Shortt, Clerk of the Council, Council Office.

Feb. 18. **TORQUAY.**—Heating and ventilating the pavilion proposed to be erected in the Princess Gardens, Torquay, for the Corporation. Heating and ventilating engineers can obtain full particulars of Henry A. Garrett, Assoc.M.Inst.C.E., Engineer, Market Street Chambers, Torquay, to whom tenders and schemes are to be sent. Heating on the low-pressure hot-water system and ventilating on the inlet and outlet system preferred.

Feb. 19. **PADDOCK WOOD, KENT.**—Construction of a heating chamber and the installation of heating apparatus, at the girls' and infants' school, for the Kent Education Committee. Specifications can be seen and further information obtained at the offices of W. H. Tompsett, Barham House, Capel, Tonbridge, Kent, to whom tenders are to be sent.

Feb. 22. **LONDON.**—Road work and platelaying required for the construction on the underground conduit system of the Council's tramways in Mitcham Lane and Southcroft Road, and in Wimbledon Road, and paving works for street widenings, for the L.C.C. The route is equivalent to about 3.63 miles of single track. The contractor will be required to use the track rails with fastenings, slot rails, and conductor rails, and the special work for the crossovers, etc., which will be provided by the Council under other contracts, but all the remaining metal work and other materials will be included in the contract. Persons desiring to submit tenders may obtain specification, bills of quantities, form of tender, and other particulars on application to the Chief Engineer of the Council, Maurice Fitzmaurice, C.M.G., at the County Hall, Spring Gardens, S.W., upon payment to the cashier of the Council of £5 deposit. Full particulars may be obtained on application at the County Hall before payment of fee. Tenders to be delivered at the County Hall, addressed to the Clerk of the London County Council, Spring Gardens, S.W. Fair wages clause.

IRON AND STEEL.

Feb. 14. **NELSON (Lancs.).**—Supply of general ironmongery during twelve months ending March 31, 1911, for the Gas Committee. Form of tender, together with full particulars, may be obtained on application to A. J. Hope, Engineer and Manager, Gasworks, Nelson. Tenders must be sent to J. H. Baldwick, Town Clerk, Town Hall, Nelson.

Feb. 14. **LONDON, W.C. (for Australia).**—Supply and delivery at one of the railway piers at Williamstown, Melbourne, of the following rails and (or) fishplates, for the Agent-General for Victoria, Australia:—A, 17,089 tons of 80lb. steel rails; B, 1,525 tons of steel fish-plates for 80lb. rails. Specification, conditions of contract, and forms of tender may be obtained at the office of the Agent-General for Victoria, Melbourne Place, Strand, London, W.C., to whom tenders are to be sent. £500 deposit must accompany each tender.

Feb. 15. **MANCHESTER.**—Supply of permanent-way points, tongues, and hardened steel centres, for the Corporation. Specifications and forms of tender may be obtained on application to J. M. M'Elroy, general manager, Corporation Tramways, 55, Piccadilly, Manchester, on deposit of £1 1s. Tenders are to be addressed to the Chairman of the Tramways Committee, 55, Piccadilly, Manchester.

March 15. **MANCHESTER.**—Supply of:—Manual valves, 40ins. and 36ins. diameter; automatic valves, 36ins. diameter; reflux valves, 40ins. diameter; sluice valves from 18ins. to 3ins. diameter; air valves; and miscellaneous ironwork, for the Corporation. Specification and form of tender may be obtained on application to G. H. Hill and Sons, Civil Engineers, Albert Chambers, Albert Square, Manchester, and 3, Victoria Street, Westminster, upon receipt of cheque deposit £2 2s. Tenders addressed to the Chairman of the Waterworks Committee, must be forwarded to the Secretary, Waterworks Offices, Town Hall, Manchester.

PAINTING.

Feb. 16. **GOOLE.**—Execution of certain painting work at the Council's smallpox hospital, Dutch River Side. Specification, form of tender, and other particulars may be obtained on application to the Town Surveyor. Tenders to be delivered to Robert Tyson, Clerk to the Council, Council Office.

Feb. 16. **PORTSMOUTH.**—Painting, repairs, and renovations at the Children's Home, St. Mary's Road, Milton, for the Corporation. Specifications and forms of tender and full particulars may be obtained upon application to the Architect, G. E. Smith, of 145, Victoria Road North. Tenders, addressed to the Chairman, Board of Guardians, must be delivered at the Workhouse. Fair wages clause.

Feb. 17. **SALFORD.**—Decorating the Assembly Room and Ante-Rooms at the Salford Town Hall, for the Corporation. Specification and form of tender may be obtained at the Borough Engineer's Office, Town Hall, Salford. Tenders addressed to the Chairman of the Town Halls Committee, must be delivered to L. C. Evans, Town Clerk, Town Hall, Salford.

March 1. **LARBERT.**—Painting and decorating the Dobbie Hall, Larbert, for the Council. Specifications may be had on deposit of 10s., from Alex Smith, Clerk, Larbert, to whom tenders are to be sent.

PLUMBING AND SAINTARY

Feb. 15. **WELLS.**—Providing and laying 1,300 yards of two-inch cast-iron water main in Sharpham Drove, with sundry contingent works, in accordance with plans and specification prepared by the Engineer, William Phelps, C.E., of Shepton Mallet, for the R.D.C. Plans and specification are deposited at the office of the Engineer, Charlton Road, Shepton Mallet, where a copy of the schedule may also be obtained. Tenders are to be delivered to Alfred E. Russ, Acting Clerk, Poor Law Offices, High Street, Wells.

Feb. 16. **LLANDAFF AND DINAS POWIS.**—Construction of sewage and storm water tanks, bacteriological filter beds, automatic mechanical distributors of the sewage over the beds, pumping station, and works incidental thereto, supplying and erection of gas engines and pumps, and the laying out of land for dealing with the sludge, in connection with the Ely (near Cardiff) sewage disposal works, for the R.D.D. Plans and specifications may be seen and form of tender obtained at the office of Baldwin Latham, M.Inst.C.E., etc., Parliament Mansions, Victoria Street, Westminster, or at the office of James Holden, A.M.Inst.C.E., Engineer of the Council, Park House, Park Place, Cardiff. Quantities of works may be had on application to either, on deposit of £10. Tenders to be delivered to M. Warren, Clerk to the Council, Park House, Park Place, Cardiff.

Tenders to be delivered to G. F. Slade, Clerk to the R.D.C., 7, St. Martin's Street, Wallingford.

Feb. 25. **BANFF.**—Supplying, laying, and jointing about 430 lineal yards of fire-clay sewer pipes, with manholes, gully tanks, and about 425 lineal yards of cast-iron water pipes, with fire hydrants, and street wells, for the District Committee. Plans and specifications may be seen with the subscriber, or with James Barron, M.Inst.C.E., 216, Union Street, Aberdeen, from whom schedules of quantities can be obtained on deposit of £1. Offers to be lodged with James Grant, District Clerk, 23, Castle Street, Banff.

Feb. 28. **ALWICK.**—Execution of the following works, for the R.D.C.:—1, providing and laying about 1,800 yards of 4in. sanitary pipes, in 3ft. lengths, and construction of open reservoir to hold 50,000 gallons, near Shilbottle Wood House; 2, furnishing and laying about 1,006 yards 3in. cast-iron socket pipes and fittings from Heather Leazes to Warkworth. Plans and specifications may be seen at the office of the Rural District Council, Alnwick, and copies at 94, Queen Street, Amble. Tenders to be delivered to the Clerk, H. W. Walton, Alnwick.

March 19. **HALIFAX.**—Construction of fourteen percolating filters (8 90ft. and 6 85ft. diameter), at the sewage disposal works, for the Corporation:—22, excavators', masons', and bricklayers' work; 23, cast-iron pipes and sluice valves; 24, distributors (revolving); 25, filtering medium; 26, unloading and filling filtering medium. Plans and specifications may be seen and forms of tender obtained on application to James Lord, M.I.C.E., Borough Engineer, Town Hall, Halifax, upon deposit of £10 for each set of quantities. Tenders must be sent to Herbert Ashling, Town Clerk. Fair wages clause.

ROADS AND CARTAGE.

Feb. 14. **SELBY.**—Supply of whinstone, from April 1, 1910, until March 31, 1911, in such quantities as required for the U.D.C. Tenders to be sent to Bruce McG. Bray, A.M.I.C.E., Engineer and Surveyor, Council Offices.

Feb. 14. **LONDON, S.W.**—Executing necessary works of repair upon Victoria Road, Southfield, for the Corporation of Wandsworth. Specification and drawings may be seen, and forms of tender obtained, at the Borough Engineer's Office, New Streets Department, 56, East Hill, Wandsworth, S.W. Tenders must be delivered at the Council House, East Hill, Wandsworth, S.W. Fair wages clause.

Feb. 14. **BEVERLEY.**—Supply of about 3,000 to 4,000 tons of stone for macadamising roads, to be delivered at various railway stations and wharves, in the district, for the D.C. Particulars, forms of tender, etc., may be obtained on application to E. Picker, C.E., Surveyor, Beverley. Tenders are to be sent to F. G. Hobson, Clerk to the Council, Newbiggin, Beverley.

Feb. 14. **KNOTTINGLEY.**—Excavating, levelling, macadamising, asphalting, and channelling, etc., the following, for the U.D.C.:—Holes Road, School Road, and Fisher Street, The Holes, Knottingley. Plans, sections, specifications, and full particulars (prepared by Arthur Hartley, Surveyor, Castleford), may be seen at the Council Offices, Town Hall, Knottinglev. Tenders to be delivered at the above offices. Forms to be obtained from Walter Swaine, Clerk to the Council, Council Offices, Town Hall, Knottingley.

Feb. 16. **GLOUCESTER.**—Supply of stone for use on main roads, for the year beginning April 1, 1910, and ending March 31, 1911, for the C.C. Forms of tender can be obtained from the County Surveyor on and after Jan. 22. Tenders must be sent to E. S. Sinnott, M.Inst.C.E., County Surveyor, Shire Hall, Gloucester.

Feb. 16. **HERNE BAY.**—Making up Stanley Road, for the U.D.C. Plans, sections, and specifications can be seen and forms of tender obtained from F. W. J. Palmer, Surveyor to the Council, Town Hall, Herne Bay. Tenders to be addressed to Joseph Jubb, Clerk to the Council, Town Hall, Herne Bay.

Feb. 16. **CLACTON.**—Making-up Pier Gap, for the U.D.C. Drawings, specification, and conditions may be seen, and form of tender obtained, upon application to D. J. Bowe, Surveyor to the Council, Town Hall, Clacton-on-Sea. Tenders must be delivered to Geo. T. Lewis, Clerk to the Council, Town Hall Buildings Clacton-on-Sea.

Feb. 16. **BOURNEMOUTH.**—Making up St. Winifred's Road, St. Anthony's Road, St. Augustine's Road, for the Corporation. Full particulars, forms of tender, specification and schedule, may be obtained of the Borough Engineer, F. W. Lacey, Municipal Offices, Bournemouth, at whose office drawings can be seen, provided that £1 1s. has been previously deposited. Tenders to be sent to Geo. Wm. Bailey, Town Clerk.

Feb. 16. **HARTISMERE.**—Supply of about 2,300 tons of 1¾in. granite, and 2,950 tons of pit stones, to be delivered as required at the following stations, for the R.D.C.:—Diss, Eye, Mellis, and Finningham, on the Great Eastern Railway; Aspall, Mendlesham, and Wetheringsett, on the Mid-Suffolk Light Railway. Samples of materials to be sent, carriage paid, to the Master of the Workhouse, Eye. Tenders to be sent to Harold Warnes, Solicitor, Clerk to the Council, Eye, Suffolk. No form of tender will be issued.

Feb. 19. **BILSTON.**—Execution of private street works, Lewis Street, for the U.D.C. Plans and specifications may be seen and bill of quantities and form of tender obtained on application to Vincent Turner, Assoc.M.Inst.C.E., Engineer and Surveyor, Town Hall, Bilston.

Feb. 21. **CHERTSEY.**—Construction of a new road at Fowler's Well, Burrowhill, in the parish of Chobham, about 150 yards in length and 36ft. in width, including drainage, kerbing and paving complete, for the R.D.C. Plan, specification, and conditions of contract may be seen by appointment at the Surveyor's Office, Chobham. Tenders must be delivered to 80, Guildford Street, Chertsey.

Feb. 22. **DONCASTER.**—Supply of dross and granite, with samples, for the whole or part of the roads in the district, for twelve months, from April 1, 1910, for the R.D.C. Specifications, schedules, and forms of tenders may be obtained on applying to W. R. Crabtree, Highway Surveyor of the Council, Union Offices, High Street, Doncaster. Tenders to be sent to F. E. Nicholson, Solicitor, Union Offices, Doncaster, Clerk to the Council.

Feb. 24. **FLAXTON.**—Supply of whinstone, broken and unbroken, also for broken annealed and common slag, to be delivered, carriage paid, to the following stations, for the R.D.C.: — York, Foss Islands, Benningbrough, Haxby, Strensall, Flaxton, Barton Hill, Earswick, Warthill, Holtby, and Stamford Bridge. Forms of tender can be obtained from Joseph Peters, Clerk to the above Council, 4, New Street, York, to whom tenders, with samples, are to be sent.

(Continued on next page.)

A Practical Example

of the advantages of the use of . . .

TERRA COTTA

in large smoky towns may be seen in the adjoining illustration of the London Coliseum, which has recently been cleaned down with a steam brush.

The building was erected 5 years ago and the amount of dirt deposited on a building in the centre of London is clearly shewn by the unwashed portions.

The Terra Cotta used was ordinary hard burned stone colour supplied by

THE HATHERN STATION BRICK & TERRA COTTA CO., Ltd.,

of **LOUGHBOROUGH,**

who will be pleased to send estimates for work and samples of their various colours on receipt of quantities or drawings.

Telephone: 811 Loughborough. Telegrams: Bricks, Hathern Station.

Feb. 28. **LITTLE HULTON.**—Supply of broken granite, grit setts, granite and limestone chippings, grit kerbs, artificial flags, stoneware pipes, and gullies, cement, steam road rolling, and scarifying, disinfectants, pitch, and oil, for the U.D.C. Forms of tender and particulars can be obtained from the undersigned. Tenders are to be delivered to James H. H. Heyes, Clerk, Council Offices.

March 4. **ROTHERHAM.**—Supply of granite and slag, to be delivered at the various railway stations within the district, from April 1, 1910, to March 31, 1911, for the R.D.C. Also for carting necessary in removing the above to the roads where required during the same period. Specifications and forms of tender may be obtained from R. Bradbury, District Surveyor, Imperial Buildings, Rotherham. Tenders to be delivered to Oxley and Coward, Clerks to the Council, 6, Westgate, Rotherham.

March 15. **BRISTOL.**—Construction of a new road, about 800 yards in length, in the parishes of Nempnett and Winford, for the Clutton R.D.C. Specification on application to the Council's Surveyor (T. Orchard, The Grange, Haliatrow, near Bristol), by deposit of £1 1s. Tenders must be sent to J. Sumner Dury, the Clerk to the Council, Temple Cloud, near Bristol. For further information apply to the Surveyor.

MISCELLANEOUS.

Feb. 14. **LONDON.**—Supply of the undermentioned works and materials, among others, for one year commencing April 1, 1910, for the Corporation of St. Marylebone:—Timber, wood troughing, meter boards, etc.: Portland cement; broken granite, lime, bricks, fire-bricks, and fire-clay; footway kerb and granite pitching; Yorkshire and artificial paving; Thames ballast and sand; glazed stoneware and sewer pipes; pit flints, gravel, and hoggin; tools and ironmongery; ironwork for sewers and iron castings; plumbers' work and materials; wood blocks for repairs; painting street names. Tenders, in accordance with the printed forms, which, together with further particulars, may be obtained on application at the Town Hall, Marylebone Lane, Oxford Street, W., to be delivered to James Wilson, Town Clerk, Town Hall, St. Marylebone, W.

Feb. 14. **BELFAST.**—Supply of the undermentioned stores for twelve months, from March 1, for the Belfast and County Down Railway.:—1, iron; 2, iron castings; 3, tinware; 4, bolts, spikes, etc.; 6, springs, steel, and files; 7, nails, screws, etc.; 8, carriage fittings; 11, glass; 12, ropes, twine, and flax; 14, carriage trimmings; 16, oils and tallow; 17, varnishes; 18, colours; 19, waste; 20, fireclay goods; 21, cement and alabaster; 22, stone and brick; 23, lime and sand; 25, switches and crossings; 26, timber and slates. Samples and patterns can be seen on application to the Storekeeper, Belfast Terminus. Tenders must be sent to Thomas J. Brittain, Secretary, Queen's Quay Terminus, Belfast.

Feb. 14. **LONDON, S.W.**—Supply of the following materials (among others), for the Battersea Borough Council:—7, disinfectants; 8, bricks, cement, lime, slates, etc.; 9, material for cart and van covers; 10, granite and macadam; 12, iron bars and other materials for blacksmiths' work; 13, iron castings; 14, ironmongery, etc.; 15, paints, etc.; 16, painters' sundries; 17, varnish, etc.; 19, stoneware pipes; 20, tarred slag, macadam and limestone tarred paving, etc.; 21, Thames ballast, sand, etc.; 22, timber and other materials for carpenter's and joiner's work; 23, timber and other materials for wheelwrights' work; 25, tools, etc.; 26, York paving, etc. Forms of tender, containing full particulars, may be obtained at the Town Hall. Tenders must be delivered to W. Marcus Wilkins, Town Clerk, Town Hall, Battersea.

Feb. 15. **BROMLEY.**—Supply of timber, ironmongery, builders' materials, tools, oils, paints, etc., ironfounders' work, tar paving materials, steam road rolling, for the Corporation. Particulars and conditions may be obtained at the Municipal Buildings on deposit of 10s. Tenders must be delivered to Fred. H. Norman, Town Clerk, Municipal Offices, Bromley, Kent.

Feb. 15. **LEIGH.**—Supply of the following materials during year ending March 31, 1911, for the Corporation:—Grit setts, barns flags, kerbstones, channel stones, macadam, chippings, sewerage pipes, castings, copper sheets, pitch, cement, sheet glass. Specifications, forms of tender, and all information may be obtained from Tom Hunter, Borough Surveyor, Leigh. Tenders to be delivered to Stanley Wilson, Town Clerk, Town Hall, Leigh, Lancs.

Feb. 16. **LONDON (for India).**—Supply and delivery of Portland cement, for the East Indian Railway, as per specification to be seen at the Company's Offices. Tenders are to be sent to C. W. Young, Secretary, Nicholas Lane, London, E.C. For each specification a fee of £1 1s. is charged, which cannot be returned.

Feb. 16. **SOUTHWARK.**—Supply of the following materials (among others), for the Corporation, from April 1, 1910, to March 31, 1911:—1, asphalte, bitumen, pitch, etc.; 2, ballast, sand, etc.; 7, drain pipes; 9, English timber and hard wood; 10, foreign timber; 13, lime, cement, and bricks; 16, oils and colours; 18, paving; 20, sewer ironwork; 23, wheels, tyres, etc.; 27, wood blocks. Specifications to be seen at the Town Hall, Walworth Road, S.E. Tenders must be sent to J. A. Johnson, Town Clerk, Southwark Town Hall, Walworth Road, S.E.

Feb. 16. **BACUP.**—Supply of the following materials, as required by the various departments during the year ended March 31, 1911, for the Corporation:—1, pitch and creosote oil; 2, flags, kerbs, channels, and setts (local stone); 3, granite, macadam, granite chippings, and limestone chippings; 4, earthenware pipes, etc., waste water closets; 5, bricks (red); 6, ironmongery, tools, and brushes; 8, iron castings; 10, covers, flags, bricks, for the cemetery. Further particulars and forms of tender can be had on application at the Borough Surveyor's Office. Tenders must be delivered to Joseph Entwistle, Town Clerk, Bacup.

Feb. 17. **WALSALL.**—Supply and delivery of the following materials, for the Corporation:—About 400,000 blue and brindled Staffordshire bricks, copings, etc.; about 800 tons best Portland cement. Specifications and forms of tender may be obtained at the office of the Borough Surveyor, Council House, Walsall. Tenders to be sent to John R. Cooper, Town Clerk, Town Clerk's Office, Walsall. Fair wages clause.

Feb. 17. **ASTON MANOR.**—Supply of the undermentioned materials and stores during the period ending March 31, 1911, for the Corporation:—Broken and unbroken stone, paving and common bricks, hardware (picks and shovels), etc., iron castings, coal and slack, drysaltery, mantles for street gas lamps, disinfectants, glass, cement, pitch, creosote oil. Forms of tender and any other information may be obtained of F. W. Richardson, Borough Surveyor, Council House, Aston Manor. Tenders must be sent, with samples, addressed to the Chairman of the Public Works Sub-Committee, Council House, Aston Manor.

Feb. 18. **LEEDS.**—Supply of the undermentioned goods, among others, during the year ended March 31 1911, for the Corporation:—Small iron castings; oils; stop cocks, 3in. to 12in.; fire hydrants; cast-iron pipes and specials; ironmongery. Tenders to be addressed to "The Waterworks Committee, Town Clerk's Office, Leeds."

93, HIGH HOLBORN, LONDON, W.C.

Appointments Wanted.

The charge for Advertisements under this heading is 1s. 6d. per insertion for the first four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two. Advertisements can be received up to 5 o'clock on Monday evening.

ACCURATE QUANTITIES prepared by London Surveyor of experience, in shortest possible time; reasonable terms; provincial work undertaken; jobs measured and settled anywhere.—Surveyor, 34, Chambers Lane, Willesden, London, N.W. 'Phone, 553 P.O. Willesden.

ARCHITECT'S Assistant (28), skilful draughtsman, design, contract drawings, details, perspectives, surveys, etc.; travelling studentship winner; moderate salary.—Box 5477, BUILDERS' JOURNAL Office.

ARCHITECT and Surveyor's Junior Assistant, 5 years' experience, details, working drawings, surveying and levelling, or would represent first-class firm to call on architects, etc.—W. Waller, Kensington Road, Barnsley. 5505

ARCHITECT'S Junior Assistant, 5 year's experience; quantities, specifications, levelling, domestic, church work, working drawings, neat draughtsman; excellent references; moderate salary.—Box 5503, BUILDERS' JOURNAL Office.

ARCHITECT'S Assistant; 11 years' experience; design, details, specifications, quantities, surveying, levelling, estate work; reliable worker; excellent testimonials; state salary.—Box 5492, BUILDERS' JOURNAL Office.

ARCHITECT'S Assistant (22), just completed 5 years' articles in good provincial office, seeks engagement to generally assist in architect's or builder's office; varied experience; good draughtsman; excellent reference; salary £1 per week to begin.—Box 5490, BUILDERS' JOURNAL Office.

ARCHITECT'S and Surveyor's Assistant (21), desires engagement, 4½ years' experience with Liverpool architect, neat and reliable draughtsman, tracer, colourist, etc.; excellent testimonials.—Withers, 16, Laurel Road, Liverpool. 5512

ARCHITECT'S Assistant (23), disengaged, 5½ years' general experience and school work; good draughtsman, specifications, surveys, assist quantities, supervision, shorthand, typewriting; excellent references.—Box 5520, BUILDERS' JOURNAL Office.

"ARGENTINE." Advertiser, a foreman Plumber and Fitter, in London, and with 4 years' experience in New York, desires berth in the sanitary line in "Buenos Ayres," as Superintendent or Working Foreman; capable of control, plans, and office routine; age 39; good references.—Box 5510, BUILDERS' JOURNAL Office.

ARCHITECT'S Assistant; practical experience; neat draughtsman, details, working drawings, quantities, surveying, levelling, excellent references.—P. W. Fysh, 30, Valinger's Road, King's Lynn, Norfolk. 5511

ARCHITECT'S or Builders's Clerk, 21; neat draughtsman, tracer and colourist, well up in construction, details, and materials, usual office routine, correspondence, estate work, wages, etc., assist surveying and levelling, moderate salary.—F. F. Tester, 51, Redston Road, Hornsey, N. 5523

BRICKLAYER; general; sound experience; recent engagement, Welbeck Hotel, W.; age 40.—A., 157, Brondesbury Villas, Kilburn, N.W. 5494

BUILDER'S Clerk, Assistant (25), 10½ years one situation; thorough experience; supervision, plans, costs, accounts, wages, had full charge general office work, jobbing builder.—Box 5517, BUILDERS' JOURNAL Office.

BUILDER'S situation required with good firm; 10 years with architect; plans, details, specifications, survey, and level; superintend work; could invest capital if desired.—Box 5488, BUILDERS' JOURNAL Office.

ESTATE Clerk of Works desires engagement; over 20 years' practical experience developing large estates for London Company; exceptional testimonials.—Box 5497, BUILDERS' JOURNAL Office.

EVENING assistance rendered in preparation of plans, working drawings, specifications; some experience of theatres; in or out of office; moderate terms.—Box 5495, BUILDERS' JOURNAL Office.

FOREMAN Plumber, re-engagement, 20 years foreman to well known firm; hot-water, sanitary engineers, well up in drainage, sanitation, irrigation, etc.; honours certificates, R.P.C., well up in drawings.—J. B., 8, Albert Road, Hoe Street, Walthamstow. 5524

GENERAL Foreman or outside Manager seeks re-engagement; age 27; ten years' experience; able to take charge of building estates, etc.; well up in all trades; setting out, preparing drawings, measuring up and usual office routine.—Box 5483, BUILDERS' JOURNAL Office.

GENERAL Foreman (35), disengaged; competent all branches of the trade, trustworthy, reliable; good references and a good timekeeper.—Apply, Rashleigh, 41, Palace Road, Crouch End, N. 5506

JUNIOR Assistant (5 years' experience, London) desires engagement; moderate salary. — Apply, J. C., 10, John Street, Adelphi, W.C. 5504

JUNIOR Clerk and Assistant seeks re-engagement; abstracting timesheets, assisting P.C. quantities, etc., and general office routine; good references.—R. B., 30, Duncan Road, Richmond, S.W. 5513

QUANTITIES and specifications prepared by experienced surveyor, quick and accurate; reasonable terms.—Box 5484, BUILDERS' JOURNAL Office.

REINFORCED Concrete.—Experienced estimator and Surveyor seeks engagement with firm of contractors; designs, quantities, estimates, supervision, good organiser and manager; age 31.—Box 5496, BUILDERS' JOURNAL Office.

REINFORCED Concrete Expert to Jamaican Government for re-building Kingston, has controlled since December, 1907, design and erection work representing expenditure several hundred thousand pounds, seeks an appointment.—Box 5507, BUILDERS' JOURNAL Office.

TYPEWRITING Architect's Specifications and Reports, a speciality; sketches inserted; all work cheaply and promptly executed; estimates given.—Address, "Typist," 2, Marsham Street, Westminster. 5489

Appointments Vacant.

ARCHITECT'S Assistant required at once; good qualifications; knowledge of surveying necessary.—Longden, Architect, Leek. 5515

ARCHITECTURAL Assistant wanted for China; salary 250 dollars per month.—Write, stating age, experience, etc., Philpot, Stonegate, Ticehurst, Sussex.

B. T. BATSFORD, 94, High Holborn, London, Publisher of books on Architecture, Building, and Decoration, requires the services of one or two energetic young men to call upon architects, builders, and others in town and country to introduce his publications to them; good appearance and highest references indispensable.—Apply, by letter in the first instance, giving age, previous experience, and salary required, to B. T. Batsford, as above.

APPLICATIONS for Appointments arranged effectively; appreciated by recipients; numerous unsolicited testimonials. — Write now, Herbert Greatorex, Hackney, Matlock.

WANTED a Representative with good knowledge of fireproofing work and good connection amongst architects.—Apply, Box 5522, BUILDERS' JOURNAL Office.

WORKING Shop Foreman of Joiners (age 35 to 40), fully capable of setting out work and management of joiners and machinery; permanency to a competent man; state experience and salary required. — Address, Box 5521, BUILDERS' JOURNAL Office.

Miscellaneous.

BRICKS, best Belgian, three sizes, strong and well made, pretty colourings, absolutely water and fire proof; also **TILES**; prices upon application to P. Rapaert de Grass, Santa Koro, Shanklin, I.W.

For **ELECTRIC COPIERS** and
Daylight Printing Frames,
Try B. J. HALL AND CO., LTD.,
39, Victoria Street, Westminster.

"JOHN BULL" BRAND.—Duplicators, Carbon Papers, Ribbons, Printing, Stationery, and complete office outfits.—Write, Read Manufacturing Co., 63, Finsbury Pavement.

POLING Boards, selected lengths and thicknesses, best quality and full measure; also scaffold boards, putlogs, scantlings, deals, batten and boards; lowest wharf prices.—C. H. Glover and Co., Ltd., Importers, Hatcham Saw Mills, Old Kent Road, S.E.

SECOND-HAND Optical Mart.
For the Purchase and Sale of
LEVELS, THEODOLITES, DRAWING INSTRS.
—Clarkson's, 338, High Holborn, London, W.C.
(Opposite Gray's Inn Road).

WHITE for high-class decorations, never turns yellow; oil or water; no grinding required; 16s. to 28s. cwt.; sample box, 28lbs., 10s., paid.—F. Horle and Co., Fine Colour Makers, Harpenden. Est. 1876. 5518

WANTED at once, copies of the "Architectural Review" for January, 1910; full price paid.—BUILDERS' JOURNAL Office, Caxton House, Westminster.

Property to be Let or For Sale.

By order of the Owners, on account of completion of estate development.

UXBRIDGE ROAD, SHEPHERD'S BUSH, W.

The capital BUILDERS' and CONTRACTORS' STOCK, PLANT, and MACHINERY, including an 8-h.p. Campbell's gas engine, and 8-h.p. ditto oil engine, 2 7ft. mortar mills, the remaining stock of timber, 150 pedestal closet seats, new doors, sashes and frames, hall screens, overdoors, mirrors, panelling, pilasters, and prepared joinery work, high-class chimneypieces and overmantels in Elizabethan, Adam, Georgian, and other styles; 3,000 pieces of modern paper-hangings, about 150 gallons of assorted varnishes, 20 gallons of engine-oil, etc., glass, leaded lights, a general assortment of builder's ironmongery and brass foundry, plumber's and gasfitter's brass work, r.w. goods and general castings, ranges and stoves, gas and electric light fittings, 70 Doulton's white enamelled and other sinks, lavatory basins and stands, stoneware sanitary goods, 3,000 wall, stove, hearth, and paving tiles, 12,000 Fletton, blue Staffordshire, and other bricks, 3,000 roofing tiles, roofing slates, chimney pots, etc., scaffold boards, poles, put logs, and ladders, 4 portable offices, and portable cement shed, scaffold cords, rope falls, navvy barrows, portable forge, and a general assortment of builder's tools and stores, together with the capital timber and corrugated iron buildings, which will be SOLD by AUCTION by

MESSRS J. T. SKELDING AND HOLLAND, at the Works Yard, OLD OAK ROAD, Uxbridge Road, W., on THURSDAY, FEBRUARY 10th, at 11.30 o'clock.

Auction Offices, 48, Gresham Street, Guildhall, E.C.

TO ARCHITECTS, BUILDERS AND OTHERS.

MESSRS. JONES, LANG AND CO., of 3, King Street, Cheapside, London, E.C., have the following Building Sites for disposal:—

1.—By order of the Trustees of the London Parochial Charities.—A very important site, having an area of 6,400 feet super, situate in Garlick Hill, Queen Victoria Street, City, with two frontages, well adapted for the erection of several modern warehouses.

2.—By order of Trustees.—Nos. 131-134a, Great Suffolk Street, Borough High Street, S.E.; to be let on 99 years' lease, or to be sold, a Freehold Property, having a ground area of about 13,250 feet super, suitable for the erection of commodious warehouses.

3.—City of London.—By order of the St. Bartholomew's Hospital.—A central Building Site, Nos. 9 and 10, Monkwell Street, close to Wood Street; area 1,400ft. super.

For plans and full particulars apply to Messrs. Jones, Lang and Co., No. 3, King Street, Cheapside, London, E.C. Telephone: 830 Central.

Contracts Open.

THE URBAN DISTRICT COUNCIL OF WATERLOO WITH SEAFORTH.

TO BUILDERS AND CONTRACTORS.

The above Council is prepared to receive TENDERS for the erection of the RAWSON ROAD COUNCIL SCHOOL, SEAFORTH, near Liverpool.

Bills of quantities may be obtained from the undersigned upon payment of a deposit of one guinea, which will be returned on the receipt of a bona-fide tender.

Drawings and specifications may be seen at the office of Messrs. Appleyard and Quiggin, Architects, No. 67, Lord Street, Liverpool.

Sealed tenders endorsed "Tender for Rawson Road Council School," must be delivered to the undersigned not later than 12 noon on Monday, the 21st February, 1910.

The Council does not bind itself to accept the lowest or any tender.

By order,
JOHN I. THOMPSON,
Clerk to the Council.

Town Hall, Waterloo, near Liverpool.
1st February, 1910. 5509

TO BUILDERS.

CHURCH HOUSE, PAULTON, NEAR BRISTOL.

The Building Committee invite TENDERS from responsible builders for the erection of the above-mentioned building.

Builders desirous of tendering should, before the 31st inst., send their names to the Rev. S. Hebert, The Vicarage, Paulton. Plans and specifications may be seen at the Rev. S. Hebert's or Messrs. Melhuish and Sons, Paulton, on and after February 4th. Bills of quantities may be obtained, on payment of a fee of One Guinea (which will be returned to persons sending in a bona-fide tender in accordance with the conditions). Sealed tenders, duly endorsed, are to be delivered to the Rev. S. Hebert before twelve noon, February 19. The Committee give no pledge to accept the lowest or any tender, and in the event of the number of applications being numerous, eleven will be selected from among them.

Paulton, January 15, 1910.

February 16, 1910. Volume 31, No. 785.

THE BUILDERS' JOURNAL

AND ARCHITECTURAL ENGINEER.

This issue contains Articles on Fire Prevention and Fire-resisting Construction.

"Beautiful Sheffield."

Although Sheffield can never become one of England's beauty spots, this consideration should not, and will not, daunt those of its inhabitants who are just now expressing an almost passionate desire for its improvement æsthetically. A voluminous discussion on the subject has arisen on a scheme submitted by the Sheffield Society of Architects for the improvement of Fitzalan Square. Controversy has been provoked by the proposal to erect a statue there; and it is perhaps instructive to note the tendency of the public mind to concentrate itself on this special point, to the obscuration of the larger question. It is to be feared that this inveterate habit may prove a stone of stumbling in applications of the Town Planning Act. Minor points will divert attention from the larger issues, and, in spite of the huntsmen, the pack will follow the scent of the red herring that, whether accidentally or intentionally, is drawn across the trail. It is isolation of interest that has been the cause of most of the mischief that the Town Planning Act is expected to undo. The operation of the Act may possibly be hampered by a form of obstruction that has often been employed with deadly effect. It has been found, for instance, that given the funds for a town hall, and the decision to build it, the consummation may be delayed for years—and perhaps indefinitely—on the question of site, or of whether or not it shall have a tower; or of whether or not it shall be designed by a local architect, or built by local contractors; or of whether the materials shall be native or imported, and so on with almost inexhaustible ingenuity on the part of clever and bitter opponents of the scheme. All this, however, is by the way. It has no particular application to Sheffield; where, while the general public seem disposed to narrow the issue to the simple question of whether or not to put up a statue in Fitzalan Square, the architects and the Press have insisted on the larger view. Mr. E. M. Gibbs, for example, supports the proposal that the Corporation should have a definite policy and plan, and that the work shall be carried out under the direction of one committee. "I sigh to think," that gentleman said to a newspaper representative, "of what Sheffield is, and what it might have been had our forerunners foreseen the great growth of the city, and had they possessed the necessary powers." The success of the Act, in Sheffield or anywhere else, will largely depend upon the spirit in which those powers are exercised. It is particularly desirable to get rid of the odium that attaches to the idea of compulsion. Inducement, it must be realised, was really all that was necessary, in the majority of cases, to render private interests subservient to public polity. Stress should be laid on the important point that formerly a man was apt to build to suit himself alone, not because he was indifferent to the public weal, but because he probably had no option. There was no means of compensating him for loss in the public interest. Under the new system, he need sacrifice nothing—not even his dignity; for he will be called into conference with respect to projected improvements, in which he should be proud to assist. For the town-planning movement is essentially a co-operative concern; and the less one hears about compulsion in it, the more successfully will it work. It is very gratifying to find that Sheffield is thus early bestirring itself, and that the advocates of a "beautiful Sheffield" are so optimistic. We think that they are justified in the belief that Sheffield, or any other industrial city, may, by a judicious administration of the new powers in the new spirit, be at all events converted to comeliness. Sheffield architects are not only an intensely loyal, but a particularly capable body of men; and if their counsels are allowed due weight, the regeneration of Sheffield is assured, and the example to other industrial centres will be invaluable.

The Engineer and the Architect.

Liverpool is no laggard in town planning. Mr. John A. Brodie, the City Engineer, in a paper read last week before a local society, mentioned that, so far back as 1853, a masterly report on street requirements was published, which contained a suggestion for constructing a circular boulevard, sixty yards wide, to traverse the outskirts of the borough. The scheme fell through because of the lack of such powers as are now provided under the Town Planning Act. Mr. Brodie outlined a very alluring scheme of his own, and we are glad to notice that he advocated strongly the provision of wide belts of planted open spaces, leading out into the country. "It is difficult to estimate," he said, "what the benefit to Liverpool might be to have a few wide avenues leading out from the neighbourhood of the existing parks to the open country. Such avenues," he supposes, "by providing exceptionally good sites for large houses on their frontage, might also help to induce the more moneyed classes to remain within the town area." The advantage of this diversion is not very obvious to an outsider. For our part, we prefer the ideal set before us by M. Benoit-Lévy in the current issue of the "Architectural Review." He would like to see Paris surrounded by a girdle of green parks and fringed with small and picturesque houses, which would not interrupt the view of the city from the country, nor of the country from the city, and the idea seems to us to be very reasonable, although it might not be wholly applicable to the situation of Bristol. We naturally prefer the æsthetic to the purely utilitarian point of view; and here it seems necessary to remind architects that it is their positive duty to insist that architectural considerations shall not be unduly neglected in giving effect to the Town Planning Act. There is doubtless room for the engineer as well as for the architect, but the latter must be careful not to allow himself to be elbowed into the background.

An Aspersion on the Building Trade.

Sir John Benn's manifesto on the L.C.C. election as published in the "Daily Chronicle" of the 7th inst. contains a reference to and an apology for the former Works Department of the L.C.C. We do not wish to discuss now the question of the Works Department, nor to express any opinion upon the issues raised by the manifesto, and should not refer to it but for the following paragraphs which appear to reflect on the building trade in an entirely unfair and unwarranted manner. Sir John Benn is reported as saying: "For years a fierce battle raged round the Works Department. It has been the *bête noir* of some of the contractors of London, and at last it is sold up. May I briefly state its object and history? The Progressives, while giving two-thirds of the orders of this vast city to contractors, who deserve all credit for the good work they have done, reserved one-third for a Works Department of their own. Why? First, to protect the ratepayers against ring prices, and second, to secure proper wages and conditions for those who worked for the Council." Sir

John continues his argument, but we need only quote the concluding paragraph: "The Government keeps several great Works Departments going for precisely the same reason. The great railway companies do the same. It is impossible, as recent figures show, to protect the ratepayer without some such check. The contractors can now combine, do as they please, and charge what they like." The Works Department devoted itself chiefly to carrying out building work, hence it is obviously at the building contractors of London that the implications contained in the statements quoted are aimed; and it is alleged, not for the first time, if we remember rightly, that ring prices existed prior to the starting of a Works Department; that the ratepayers have no protection against them; that the contractors can now combine, do as they please, and charge what they like; and that improper wages and conditions existed among those who worked for the Council, prior to the inauguration of a Works Department. On the former occasion when these charges were made, they were challenged by representatives of the building contractors of the London district, and effectually shown to be false and unfounded charges, and no doubt will be again; but we wish to protest against public statements of so obviously unfounded a kind being made by gentlemen who aspire to lead a great party in the L.C.C., and feel sure that on reflection their author will regret them. It is absurd to say the ratepayers have no protection against ring prices and improper charges when there are several thousand contractors in the London district eager and willing to compete for the Council's work, not to speak of the thousands of contractors from provincial towns, many of whom regularly compete for works in London, and most of whom would be only too glad of the chance to do so. To talk about "ring prices" and about contractors "doing what they please and charging as they like," when the Council has thousands of competing contractors to choose from, is sheer nonsense. It is equally absurd and untrue, so far at all events as the building trade is concerned, to say that improper wages and conditions existed among those who worked for the Council prior to the inauguration of a Works Department. The organised builders of London had agreed to working rules with the organised workmen of London long before the Works Department was dreamed of, and the rules remain substantially the same, although the Works Department has passed away. We trust that Sir John Benn will promptly withdraw the unjust aspersion.

Square Chancels and Round Visits.

A small point, that is nevertheless of considerable interest to students of architectural history, was brought out by Mr. Frederick Batchelor, President of the Royal Institute of Architects of Ireland, in a lecture he delivered last week to the Liverpool Architectural Society. He is said to be the first Irish architect who has lectured to this society, which seems almost incredible, not to say deplorable, seeing how fine a taste the Irish have in the arts, how great is their natural gift of eloquence, and how much advantage is to be gained by close communion between the several races of which the United Kingdom is so fortunately made up. That, however, is not the point to which reference is made in the opening sentence of this note. Mr. Batchelor, with "Architecture in Ireland" as his subject, traced the development from primitive cromlechs to round towers, castles, and cathedrals; and Professor Reilly agreed with his statement that England owes its square chancels to Ireland, where they are the rule. We should like to see more of this interchange of visits and ideas between those who are sundered by distance, but who are one in their devotion to the Mistress Art. Distance is no doubt a great obstacle; but we should like to see more effort to overcome it. Why should not the R.I.B.A. hold meetings in various important centres of the United Kingdom? Less important bodies have realised the very considerable advantages attendant on "movable conventions."

Grouped Shops.

Some time ago we were able to give an illustrated account of an interesting experiment in co-operative planning in Berlin. It seemed to us to represent a development of the bazaar or arcade system, the vital difference being that common services were shared and common expenses pooled by the various shopkeepers, who otherwise traded independently. This system, properly conducted, would go far towards placing the small shopkeeper on an equality with the great stores. The system is about to be tried in London, whether as a direct result of the article which appeared in our pages we are not aware. Mr. F. E. Boulting, the architect, has stated to certain newspaper correspondents that a site has been secured in the West End, upon which it is proposed to erect a large building on the lines of the great stores. It will be, like them, replete with every convenience for the public, such as refreshment rooms, reading rooms, and all other facilities; and the tradesmen who occupy the shops will have the expenses of rent, heating, lighting, insurance, and advertising covered by an inclusive charge, which will be considerably less than would have to be paid independently; and the delivery of goods will be undertaken on special terms. If the system is found to be successful, we shall get something new in planning, and perhaps in style; while the small shops will rapidly disappear from the streets of our great towns, giving place to buildings on the scale of the stores. The experiment will therefore be watched with considerable interest by architects and builders.

Obituary.

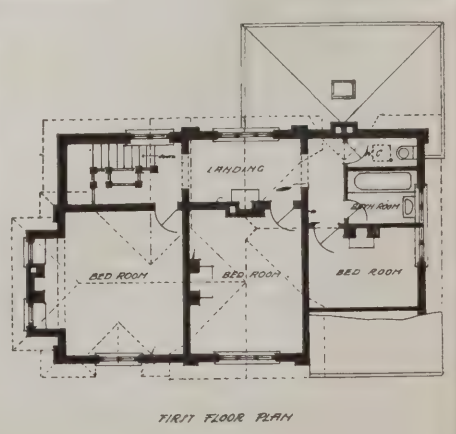
We regret to announce the death of Mr. Edward Shewbrooks, of the firm of Shewbrooks and Hodges, architects, Newcastle, which took place very suddenly on Saturday, February 5th, at his residence in St. George's Terrace, Jesmond. Mr. Shewbrooks, who was about 60, designed Baltic Chambers, offices at the Quayside and Guildhall Chambers, all in Newcastle, and stables and carsheds at Newcastle and Gosforth, for the local tram service. He also designed the Central Co-operative Stores, Newgate Street, branch stores at Benwell and Jesmond, etc., and the Home for Incurables at Spital Tongues.

Obiter Dicta.

A Great Sculptor.

The qualities of his work, like all things classic in spirit and form, were those that would survive all fashions, all peculiarities of time and place. His art would survive those because its principles were inherent in humanity as a whole, and in the very nature or art—principles that strive to embody the greatest common beauty and character free from what was excessive, peculiar, eccentric, or the result of personal bias.—*Mr. Henry F. David, on Alfred Stevens: his life and work.*

Town versus Country.



What is wanted is a oneness of human and social life. Our modern cities are far from what they ought to be, and their existence is not likely to be so significant to posterity as was that of Athens, Jerusalem, Rome or Florence. If there was anything destroying and retarding the progress of social science to-day it was that townsfolk and countryfolk had been so separated and so unable to understand one another.—*Professor Geddes at the Liverpool City Guild.*

Provision for Town Extension.

We still live in towns which were, perhaps, better suited to the needs and conditions of our ancestors—towns that have been long outgrown, and that in too many instances have become grossly overpopulated; and it is a still more curious reflection that the industries which have brought us so much material prosperity should have been the direct means of producing so much misery and discomfort in the form of unhealthy fumes, ugly buildings, and squalid and congested areas. . . It is clear that the many evils consequent upon overcrowding arise from the want of foresight which is specially characteristic of France and England—the failure to plan and provide for future extensions.—*G. Benoit Lévy, in Town Planning and Housing Supplement to "The Architectural Review," February*

The Chelsea Arts Club gave a complimentary dinner to Mr. Stanhope Forbes, the new R.A., and Messrs. Ernest George, F. Derwent Wood, and William Orpen, the new Associates of the Royal Academy. There was a record attendance. The President, Mr. J. J. Shannon, R.A., in the course of a witty speech proposing the toast of the guests, said: "We know something of the politics of this club and I have frequently had to remonstrate with you about it. But the George we have with us to-night is *Ernest*. It is his mission in life to provide us with homes!" (Great laughter.)

COTTAGE AT THORNER, YORKS. CECIL T. MITCHELL, ARCHITECT

RENAISSANCE CHURCHES IN FRANCE.*

By W. H. Ward, A.R.I.B.A.

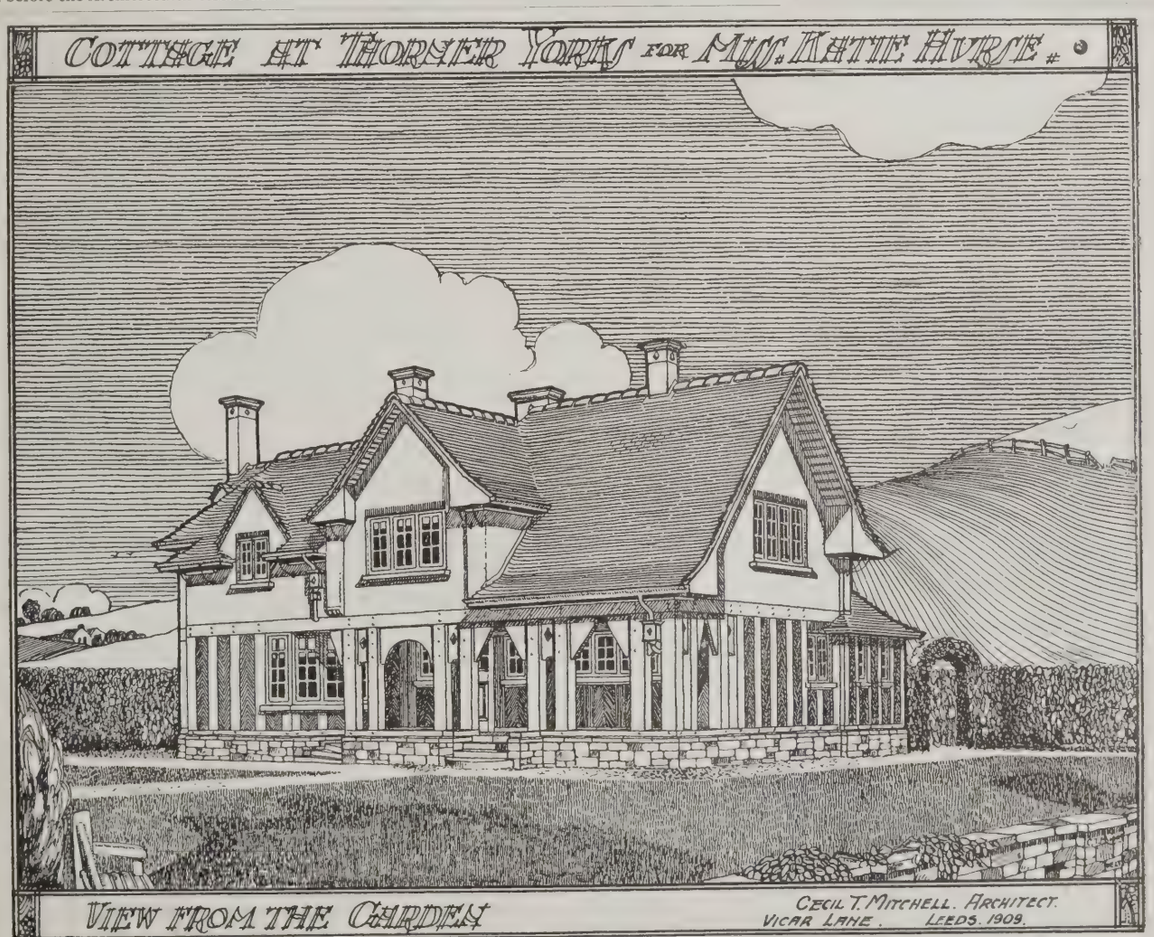
France in the sixteenth century offers the picture of the union of two architectures, so different in their aims and in their forms as to seem irreconcilable. Yet the union was not unhappy in its results. The products of the combination are so rich, so vigorous, so varied, and their development, though so often balked by events, is so rapid, that few more fascinating studies can be found in the history of architecture.

Religion and Architecture.

It is a commonplace that the history of architecture is in most countries and ages the history of religious architecture. In the Middle Ages if church architecture were eliminated nothing coherent, or indeed very important, would be left. But, at the time of the Renaissance, western Europe had largely outgrown the tutelage of the Church. The idea of nationality was developing, and in England, Spain, and France the focus of national life was becoming a strong centralised monarchy. The architectural expression of this state of affairs is to be found, therefore, in secular building, and more particularly in the dwellings of the Sovereign and his Court. The architecture of France in the sixteenth century is essentially an architecture of châteaux, of the pleasure-houses of a still half-feudal aristocracy. Church architecture is thus a by-path, but a pleasant and withal an instructive path to trace out.

Mediæval Methods Die Hard.

It has often been remarked that men are most conservative in matters of religion; in this respect architecture is no exception, and mediæval methods died hard in France. On general grounds it was to be expected that the resistance to a classic revival would be strongest in the cradle of Gothic art. More especially would French church architecture, whose development had been the inspiring idea of Gothic art, be its last stronghold. Accordingly, we find that side by side with the new tendencies pure, or all but pure, Gothic designs persisted in much church work of the first half of the sixteenth century. Some parish churches and large portions of several of the cathedrals commenced under Louis XII., and not finished till the reign of Henry II., are cases in point. Even beyond this period, when Renaissance forms had become as firmly established in religious architecture as elsewhere, sporadic instances of Gothic design are by no means rare. St. Merry in Paris (1520-1612) shows hardly a trace of them. The Gothic cathedral of Orleans was only begun under Henry IV., and its pseudo-Gothic west front not built till the reign of Louis XV.



Conservative Craftsmen.

As in secular architecture, the Renaissance movement spread from the top downward. The most strenuous opposition to innovation would seem to have come from the conservatism of the craftsmen specially attached to the service of the Church and trained by hereditary traditions of construction and technique, and from the lower clergy, often poor, ignorant, and superstitious. On the other hand, the heads of the profession, the great master masons of the cathedrals, seem to have been ready to accept hints from Italy. French clerics of standing usually journeyed at least once to Rome, and great political churchmen, such as the Cardinal of Amboise, the builder of Gaillon, and his nephew, or Cardinal Ippolito of Este, passed continually to and fro. Again, French benefices were a convenient provision for Italian younger sons and "nephews" of popes and cardinals; these prelates often considered their duties discharged when they had drawn the revenues, but the personal belongings and church paraphernalia of those who did reside would be a revelation to their French neighbours, even when they did not directly introduce Italian artists or architects. The field of possible Renaissance influence in church architecture is thus confined to the relatively small amount of work undertaken by Catholics, and a portion only of that.

Christian and Pagan Conception.

All Christian architecture derives ultimately from a classical source, and that the nearer it is to the age of primitive Christianity the more classical it is. At a period when the subtlest minds were striving to harmonise ecclesiastical and pagan conceptions of the universe—a task with which Dante had busied himself two centuries earlier—when Marsilio Ficino was attempting to reconcile the philosophy of Plato with the teachings of Our Lord, when Lionardo da Vinci was painting John the Baptist with the attributes of Dionysus, these heathen allusions did not shock the faithful. All antiquity was in their eyes a part of the divine plan of the world's government, and equally available with the Scriptures and the lives of the saints for the illustration of moral and theological truths. Parallels were found without difficulty—Hercules with his club figured side by side with Samson and the ass's jaw, amorini were hard to distinguish from cherubs, satyrs from devils, or the queen of the gods from the Queen of Heaven. The

*Paper read by W. H. Ward, A.R.I.B.A., on February 4th, before the Architectural Association.

The Walls are to have a stone plinth to ground floor level, with half timbering (filled in with old roofing tiles, laid herring-bone pattern in cement) up to the first floor, and above this they will be finished in sand-faced stucco, on stock bricks. The first floor cills and the chimney caps will be of local stone. All external woodwork is to be of oak, including the ground-floor window cills which will be covered with lead. The roof will be covered with old hand-made roofing tiles. The internal woodwork is to be of deal throughout treated with dark brown preservative. The ground floor will be solid concrete covered with 2in. pitch pine wood blocks. The floors of the scullery, pantry, back w.c. and the verandah will be tiled, also the floors of the bath-room and w.c. on the first floor with 12in. hand-made red quarry tiles, the latter floors being carried on steel joists in the kitchen ceiling. The whole of the windows will be glazed with crown glass.

ancients might have been pagans, but it was quite possible, "*avec un peu de bonne volonté*," to believe that their mythology was but an imperfect foreshadowing of Christian doctrine, and since in other things there was so much to be learnt from them, allowance might be made for the moral shortcomings of their divinities. The Renaissance sculptor may have been pedantic when he represented God the Father with the attributes of Jove the Thunderer, but he was conscious of no more incongruity in doing so than the artists of the catacombs who portrayed the Saviour in the guise of Orpheus. It must not, however, be supposed that pagan elements, as distinct from definitely architectural forms, played a leading part in the decoration of churches. Everywhere Scriptural and hagiological subjects predominated, together with emblems illustrative of theology and worship; they were merely expressed in a new manner.

Reimportation of Classical Form.

Whatever view may be taken of the reimportation of classical forms into church architecture, there can be no question that it was inevitable. No institution forming a vital part of national life can remain unaffected by its intellectual environment, and church builders had to assimilate the humanistic tastes which were permeating the whole of educated society. In doing this they were confronted with the same problems as the castle-builders—the clothing of a mediæval framework in a modern dress; but there was this difference, that, whereas in the castle the reason of its being—its fortification—was growing obsolete, and some semblance of it was retained only from habit and for sentimental reasons, in the church the functions were unaltered, and no change in essential arrangements was tolerated.

French and Italian Methods.

The architecture of the church was thus, like all contemporary architecture, a compromise between French and Italian methods. It differed in retaining throughout a larger proportion of the essentially native element. The great interest in studying it is to trace out the way in which the builders set to work to translate traditional details, features, and types of composition into a new form-language as fast as they learnt it. It is curious to observe to what different results these attempts led; not only how they differed from decade to decade, but how simultaneous attempts differed from each other. This is due to differences not so much in the taste as in the cast of intellect of the designer. A man with an aptitude for grasping the grammatical principles of a language, but a poor head for vocabulary, will soon know how to construct sentences in a foreign tongue, but will have to fall back on his own for words. He is, however, a less common type than the man who can pick up words parrot-like and learn to speak a foreign language, fluently perhaps, but ungrammatically. Thus, in architecture we see more examples of rapid advance in forms keeping pace with the changes in fashion, but employed to express old types of design, than of a quick grasp of new general principles of design; and when the latter occur they are not always up to date in detail.

After my remarks on the conservative tendencies of religious architecture it may appear somewhat contradictory to state that the earliest known Renaissance structure in France is a chapel, that of St. Lazarus, built in the old Cathedral of Marseilles (1479-81) by Francesco Laurana. It is, however, an isolated phenomenon without immediate results in a province far removed from the centre of national life, and not even immediately ruled by the French King. It was designed in the Italian manner by an Italian for a prince connected by blood with an Italian dynasty.

Some Noteworthy Examples.

In a screen from St. Jacques at Dieppe the tracery, the bases and sections of the mouldings, and the spiral shaft are all in accordance with flamboyant Gothic usage, but the shell panel-heads, the capitals, the entablatures, and the round arch speak of the Renaissance.

Similarly in a door from the Cathedral of Aix, in Provence, there is a complete mingling of pilasters and arabesques with crocketed pinnacles. It looks as if the work was done by a Frenchman much more at ease in the contorted naturalism of the contemporary Gothic foliage than in the calmer conventional flowers and fruit of the friezes and panels of the Italian type.

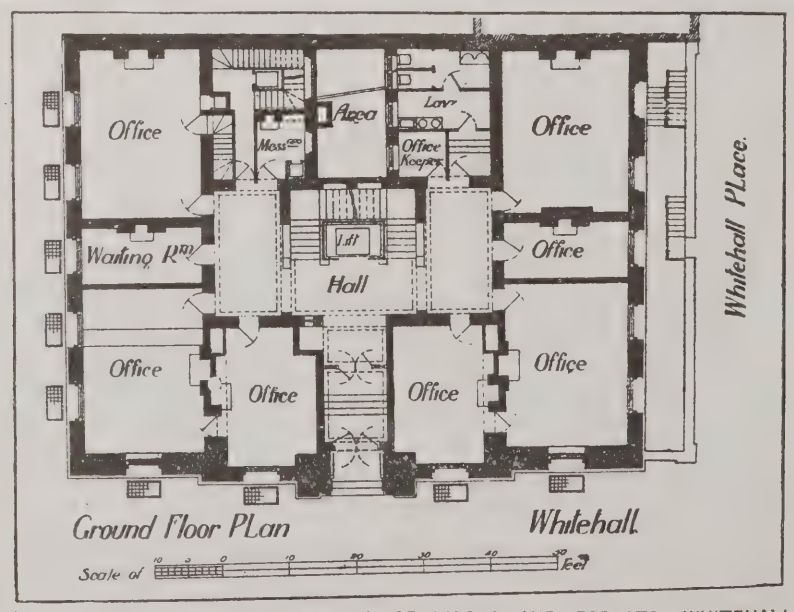
In a pier from the front of St. Michel, at Dijon, the Gothic element in the detail has been reduced, but the niches are still composed of alternately Gothic and Renaissance elements, but the Renaissance elements are more thoroughly assimilated.

The upper part of the northern of the two towers at the west end of Tours Cathedral is one of the earliest transitional ecclesiastical structures whose date is known. It was finished in 1507, probably by the brothers Martin and Bastian François. The southern tower finished forty years later, probably by Martin's son, Gatien, is virtually a copy of it. The two elements are better blended in this example than in most of the previous ones, but still without definite system.

In the font canopy at Bretagnolles, near Evreux, all the detail except the shaft bases is Renaissance, but the shafts themselves and their caps have a fifteenth century outline. The tendency to turn the cusping of the tracery into foliage is one which was much developed later.

A wooden rood-screen from Villemaur, a village near Troyes, seems to have reached exactly the same stage of development as the last example, though not finished till 1521. It belongs to a neighbourhood which was for many years an important centre of Renaissance church work. The churches of Troyes itself are rich in examples.

When we turn from single features to a complete composition, we find that the task of amalgamation proved rather more than the architects of the day could cope with. Nothing more awkward can be imagined than the front of the church of St. Calais, near Chateaudun, as a whole. Almost all the features are translated into Renaissance forms; some of them are individually beautiful, as for instance the central doorway with the scrollwork tracery in the fanlight. But in composing the entire elevation the architect floundered hopelessly. He got a certain amount of horizontality into it, but felt bound to keep the traditional vertical division by using clumsy buttresses, and then made a futile attempt to connect them up with the upper window by a flamboyant Gothic label with a pediment on the top of it.



In the front of the castle chapel at Ussé, the designer has succeeded in fusing the two styles into a harmonious blend. While almost every detail is Renaissance, the general effect of the elevation is distinctly mediæval, so completely does it retain the vertical aspiring character, an effect emphasised by the grouping of the door and window into a single feature under a pointed arch and a canopy of flamboyant outline. The pinnacles have no crockets or gablets, but are represented by a feature of approximately similar silhouette—a tapering candelabrum motive.

The Church of St. Eustache.

St. Eustache, in Paris, begun in 1532, is the largest and completest Renaissance church of the century in France. It was designed as a whole from the first as a Renaissance building, and, with the exception of the west end, carried out in accordance with the original design. The architect is not certainly known. The ultra-patriotic writer, M. Léon Palustre, invented a beautiful theory that it was the work of three generations of a family of master masons named Lemercier, and therefore owed nothing to Italian influence. But this theory will not bear investigation. There is nothing to show that either the first or third had any connection with St. Eustache or that they were related, or that the second ever existed. On the other hand, there is nothing improbable in the suggestion that the design was due at least in a measure to Dominic, of Cortona, known in France as Boccador, who, after living for many years at Blois, where he worked for Louis XII. and Francis I., and was the probable inspirer of much of the work in the Loire valley, removed, at Francis I.'s order, to Paris in 1531, to act as architect to the new Hôtel de Ville. The work was carried on slowly till 1589, and resumed from 1624 to 1654, when it was complete with the exception of the upper part of the west front.

In plan St. Eustache is practically identical with Notre Dame, the principal difference being that whereas Notre Dame has five bays in the choir and eight in the nave, St. Eustache has three and five respectively. In other respects the dimensions are nearly equal. The internal width of the transepts is about 148ft., and the internal length about 280ft. (not counting the Lady chapel). The circular form of the apse is not in this case a Renaissance innovation, but borrowed from the Gothic model.

In section the likeness is less striking. Though the height of the nave (107ft.) is about equal, it is flanked by double aisles,

NEW OFFICES FOR H.M. COMMISSIONERS OF WOODS AND FORESTS, WHITEHALL, S.W.
JOHN MURRAY, F.R.I.B.A., ARCHITECT.

NEW OFFICES FOR H.M. COMMISSIONERS OF WOODS AND FORESTS, WHITEHALL. JOHN MURRAY, F.R.I.B.A., ARCHITECT.

These new offices are now practically completed. Portland stone from the Wakeham Quarries has been used for the three street frontages, and the general levels of the new frontage have been kept to range with the War Office buildings. The building is supported by a raft of concrete, and the basements are enclosed with concrete retaining-walls. As will be seen from the plan, the offices on each floor are grouped round a central hall, in which is the principal staircase, constructed in reinforced concrete covered with Silex stone. An electric lift is fitted in the staircase well, and electric light and telephone are installed throughout. Upon the site stood old buildings erected at the end of the 18th century, and formerly the land was part of the garden of old Whitehall Palace. During the excavations numerous larch and fir piles which supported the old buildings were removed, and many of them were found to be as sound as new timber. The builders are Messrs. John Mowlem and Co., and the following are some of the sub-contractors:—Bromsgrove Guild, Bromsgrove, lift enclosure in heavy wrought-iron with cast-iron enrichments; also special bronze electric light fittings; R. Waygood and Co., London, lift; A. Simpson and Co., Ltd., London, mosaic; Hopton Wood Stone Firms, London, stone wall linings, newels for staircase, and dado plinth; S. Wright and Co., London, plaster cornices, etc.; J. and R. Corker, London, grates; Rosser and Russell, London, heating, hot water supply, and ventilation; Crittall Manufacturing Co., Braintree; C. H. Mabey, London, Sculptor; Sissons Bros., and Co., Hull, and Silicate Paint Co., London, decorative materials; British Luxfer Prism Co., London; James Annan, Ltd., London, plain plasterwork.

both of great and equal height, instead of the low inner and lower outer aisles at Notre Dame. In consequence the air of spaciousness is greatly increased, and, a much loftier nave arcade being possible, the effect of verticality is also greater though counterbalanced by round instead of pointed arches and vaults, as may be judged from a view of the interior.

A pier between the outer and inner aisles is of the compound type with pseudo-orders performing the various functions required. On the angles are members composed of a series of superposed pilasters and engaged shafts taking the relatively thin and unimportant diagonal ribs, their entablatures, which correspond with the springing of the chapel vaults and arches, etc., introducing a welcome horizontal element. On the faces of the piers, on the other hand, are unbroken panelled pilasters carrying the heavier cross vaulting ribs and arches of the arcades. They supply the strongly-marked vertical line, yet further emphasised at the crossing piers, which is the dominant note of the interior.

At St. Pierre, at Tonnerre.

Compound piers with no horizontal element introduced are used at the section with similar responds for the choir arcade, but the remaining choir piers make a return to the single shaft, and are treated as Doric columns, with the cylinder carried above the cap for the arch moulds to die into. The treatment of the latter as a panelled splay is effective, and seems intermediate between the receding mouldings of Gothic tradition and the architraved treatment of the later Renaissance.

Other Churches.

St. Etienne du Mont, in Paris, is contemporary with St. Eustache, and of similar plan, but it is on a smaller scale, and shows a gradual growth in style from east to west. The choir (1517-37) is almost pure flamboyant Gothic; some Renaissance elements appear in the crossing and transepts, and they become more pronounced in the nave (1538-60). The west end and rood-loft belong to the reign of Henry IV. The balustrated gallery half-way up the piers is a pretty and almost unique feature, whose use is to steady and give an appearance of solidity to the tall plain shafts. It is curious that the tower arches should be of more advanced type of design than the upper. The capitals are unnecessary and unsightly.

Though adorned with clumsy sculpture, the nave-pier from Notre Dame de Bon Secours, at Guingamp, is an interesting one. The heavily-moulded arches die into a cylindrical shaft, which lower down becomes octagonal and stands on a square base. A slender circular vaulting-shaft is carried up the face from the floor. The arches are pointed, but have a key-block. The triforium is prettily designed, but carried out in the clumsy detail usual in Brittany, and due partly to the distance from more civilised centres and partly to the hardness of the local stone.

Unmoulded Tracery.

After about 1530 unmoulded tracery came into fashion, and was largely used in a new type of design which altogether avoids the flowing lines, and to some extent the geometrical patterns hitherto in use, and simulates slender skeleton edifices. The mullions become shafts, and sometimes have capitals, the transomes become entablatures; the tracery takes the form of arches, pediments, circles, and scrolls, all of which is sometimes plain, sometimes carved. The left-hand window in the church of Notre Dame des Marais at La Ferté-Bernard shows an example.

Advanced Renaissance Examples.

Having run through a number of examples of translations of more or less Gothic motives into Renaissance language, and of isolated Renaissance features applied to half or wholly mediæval churches, the author came to those churches of the advanced Renaissance which were designed as a whole in plan and section as well as elevation on classic lines. No church of any size was designed, still less executed in this style, however, and the only examples consist of half-a-dozen private or mausoleum chapels, of which only the two at Anet are still standing. The only non-domical one of the group was built at Anet, probably about 1560 for Diane de Poitiers outside the château, to contain her tomb, by an unknown architect. It does not seem to have been designed by Philibert de l'Orme, but may possibly be the work of Jean Bullant. It is a simple form of basilica, consisting of a rectangular nave with a barrel vault, two square sacristies, and an apse with a semi-dome, and thus forming a rough cross. Its façade is one of the most classical fronts of the century, and decidedly monumental in effect.

The domical chapels all differ from the previous examples of domes in that their plans are entirely conditioned by the dome. One of the earliest was a so-called temple in the park at Villers-Cotterets by Philibert de l'Orme, no longer existing. A circular chamber with hemispherical dome was surrounded by three rather more than semicircular apses, whose domical roofs of corresponding form butted against the walls of the central chamber. The entrance of the fourth side was through a pedimented portico. It was for this portico that de l'Orme invented his so-called French order of banded columns. On the death of Henry II. (1557) Catherine de'Medici instructed her architect, Primaticcio, to design a mausoleum for her husband, her children, and herself. This resulted in one of the purest and completest classical buildings that France ever possessed. It was begun in 1570, but was unfinished when the Valois dynasty came to an end with the murder of Henry III. The Bourbons did little to it, and it fell into disrepair, and was destroyed by the Regent Orleans in 1719. It stood on the north side of the Abbey church at St. Denis, and was entered from the transept. The royal tomb occupied the centre, those of the other princes were to stand in the trefoil chapels which radiate from it. Over these a gallery ran round the upper part of the central hall, which had a hemispherical stone dome itself covered by an independent timber dome, the first of its type in France. The elevations, treated in a manner recalling those of the Louvre, were excellently proportioned and doubtless beautifully detailed. The interior was enriched with coloured marbles and the work of the great sculptors of the day. The tomb of Henry and Catherine can still be seen in the Abbey. The monument as a whole was a worthy resting-place for the ashes of the Valois kings, whose love for art had so large a share in endowing France with the glorious buildings of her Renaissance in its various stages.

Discussion.

Mr. John W. Simpson, F.R.I.B.A., proposed the vote of thanks, and congratulated the Association upon its remarkable success in procuring such interesting papers for its meetings. The fables of Gay, relating a discourse between a lion and an ape, or other animals, were always pointed by a moral. He would follow this example, whose chief merit was its brevity. Students should study architectural design and contemporary history together; and unless this method was followed the standard of criticism would inevitably become insular and cramped. Mr. Simpson proceeded to emphasise the necessity for studying a piece of architecture with due regard to its environment, and to the people for whom it was conceived, otherwise it would never reveal its true meaning. The paper, he said, gave in logical sequence an admirable account of a most interesting phase of architectural development in France.

Mr. Edward Warren, F.R.I.B.A., in seconding the vote of thanks, said that the study of the architecture of the French Renaissance was one of much charm; and it was interesting to follow contemporary development in different countries. Conservatism had kept us as much behind France, as France had been behind Italy. In England there were many instances of French work. At Christchurch, the Salisbury tomb was obviously French; and at Brede, in Sussex, there was the recumbent form of a warrior on a Renaissance tomb, which was dated 1537. French Renaissance work was to be seen in Old Chelsea Church, and in the stalls of King's College Chapel at Cambridge. He thought that the more interesting points in the sequence were at the beginning and the end. At the beginning, a class of ornament was largely used where it was not wanted, sometimes with picturesque results.

Mr. Allan Potter, in supporting the vote of thanks, observed that his feelings had been somewhat mixed while listening to the lecture. He had great admiration for Mr. Ward's knowledge, but less for his subject, which appeared to be a protracted struggle, between Gothic and Italian Renaissance. The earliest and the latest examples were certainly the most satisfactory. It was with relief, after the time of Henry II., that purer classic work was encountered. The period would be, he thought, of more interest to the student of social and religious evolution. The direct lessons, architecturally, were nearly all in the negative. Mr. Potter then asked whether Mr. Ward could say whether there

THE FLOODS IN PARIS: A VIEW IN THE GARE D'ORLEANS, QUAI D'ORSAY.

This view is taken at the bridge level, and the depth of the water may be judged from the view on the opposite page, taken during the construction of the building.

THE GARE D'ORLEANS TERMINUS, QUAI D'ORSAY, PARIS, DURING CONSTRUCTION.

This, the newest and one of the finest of the termini in Paris, has been disastrously affected by the recent floods. The trains run into the station by electric traction from outside Paris, and the rails are below ground level. Some 16 feet depth of water now fills the station up to the bridge or outside road level. M. Laloux was Architect-in-Chief of the building, with M.M. Lemaresquier and Mayeux as Assistants. The view shows the steelwork construction of the building.

was any architectural connection between France and Spain at the time of Francis I.

Mr. H. P. G. Maule, F.R.I.B.A., and Mr. Rudolph Dircks, having joined in the discussion, the president (Mr. Henry Tanner) summed up and said that what little criticism there had been was no reflection on the able way in which Mr. Ward had prepared his paper. He was inclined to agree with the remarks of Mr. Potter.

Mr. Ward, in reply, said he had no special knowledge of the Renaissance in Spain, but he thought that the captivity of Francis I. had no influence on the architecture. Probably there were many Italian workmen in both countries.

Societies' Reports.

Glasgow and West of Scotland Technical College Architectural Craftsman's Society.

Mr. John Miller lectured to this society on "Some general observations on native timber." Dealing first with the structure, formation and growth, Mr. Miller spoke at some length on the means of identification, colour and texture. Several remarks were made on decay in timber, special reference being made to "dry rot." The suitability of Scotch timber for home use was also touched upon, and the lecture was concluded with a reference to afforestation, pointing out its advantage as a state asset, giving as evidence the forests in Germany and other countries.

Bradford Philosophical Society.

Mr. J. B. Stoughton Holborn continued, at the Bradford Mechanics' Institute, the series of lectures which he is giving under the auspices of the Bradford Philosophical Society upon "The History of Gothic Architecture." Interpreting the word "Gothic" to include the Romanesque architecture, Mr. Holborn devoted his address to an examination of the characteristics of the Norman style, the development of which he traced with the aid of a large series of drawings and photographic lantern slides. Briefly comparing English with Continental work, he observed that while French architecture developed more logically the English style, in his opinion, followed lines which, while less logical, showed greater beauty.

Leeds and Yorkshire Architectural Society.

Mr. J. A. Gotch, F.R.I.B.A., delivered a lecture on "The Elizabethan House." He explained that the Thorpe and Smithson collections of contemporary drawings together afforded a complete picture of the development of house design in England during the sixty years from 1570-1630—a period during which were built all the fine houses known as Elizabethan and Jacobean, including such places as Burghley House, Kirby Hall, Hatfield House, Bolsover Castle, and many others. These drawings, with reproductions of which the lecturer illustrated his paper, indicated the gradual and interesting change which took place in house-planning at that period. Prior to the sixteenth century the hall had been the chief apartment, forming the centre of the house, with the family rooms at one end and those for the servants at the other. Gradually, however, the hall ceased to be the heart of the house, and instead of being the principal living-room it became a vestibule leading to the rooms in constant use; so one of the strongest links with the mediæval past was broken. The elevations of the houses, too, showed the change from the semi-Gothic treatment of the early days of Elizabeth to the more formal and classic treatment at the end of James I.'s reign. The powers of design and of draughtsmanship of architects in the sixteenth and seventeenth centuries were admirably displayed in the selection of slides which the lecturer showed upon the screen. A vote of thanks was accorded Mr. Gotch for his paper, and members of the society participated in the discussion which ensued.

Edinburgh Architectural Association.

The fifth meeting of the session of the associates' section of the Edinburgh Architectural Association was held on February 2, in the rooms at 117, George Street. Mr. William Davidson occupied the chair. The principal business before the meeting was a paper by Mr. F. C. Mears on "The Failure of the New Town Plan." Mr. Mears, at the outset, exhibited a number of plans of the Old and New Towns of Edinburgh as they existed in the seventeenth and eighteenth centuries, and maintained, on a close and elaborate examination of these, that the designers of the New Town, i.e., Princes Street, George Street, and Queen Street, had failed in that they showed a lack of foresight in dealing with the valley of the Nor' Loch; in failing to provide in the original scheme for outlets, communications, or bridges, other than by the North Bridge; and in the arrangements of the houses in a continuous line east and west. Mr. Mears was cordially thanked for his address.

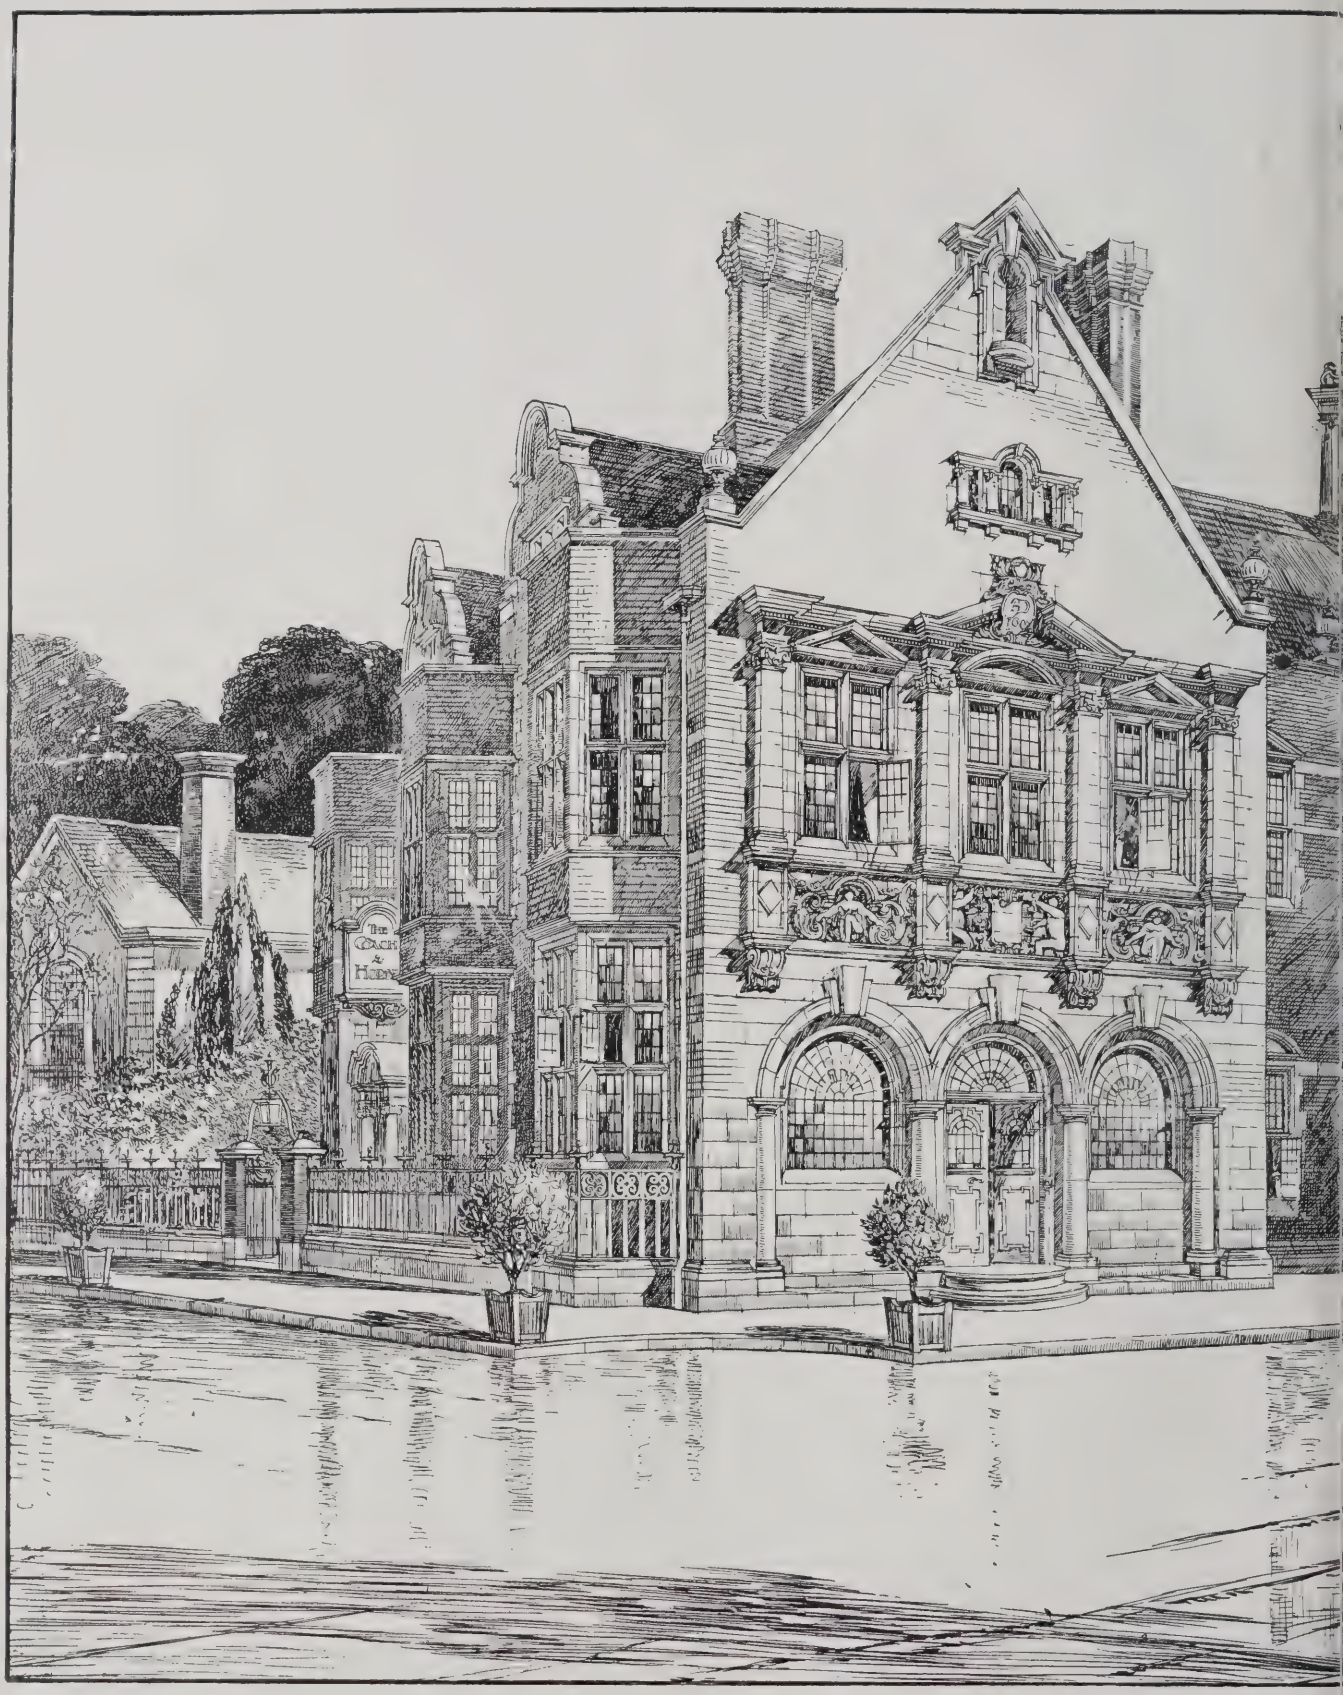
THE FLOODS IN PARIS: THE PRESSURE ON THE BRIDGES.

This view, taken of the river at the Henri Quatre Bridge, shows the danger to which the bridges were subjected by the pressure of the water.

The Institution of Municipal Engineers.

At a meeting of the Council of the Institution held at 39, Victoria Street, London, S.W., on Wednesday, January 26, seven applicants were elected to membership. The roll of the institution now stands at 686 members and 96 students, making a total of 782. The report of the committee appointed to draw up regulations for district committees was presented, and the draft regulations accompanying the report were unanimously approved and ordered to be circulated. The Superannuation Committee reported that a letter, in the terms of the resolution passed at a meeting of the Northern District Committee, held on December 18 last, had been sent to the National Association of Local Government officers, and that, as a consequence, that body had sent a letter (the text of which appeared in the December issue of the Institution "Journal") to each candidate for Parliament at the present election. The secretary was instructed to arrange for a general meeting of the Institution in the Western District during the month of March.

Gloucestershire Architectural Association.



The annual general meeting of this association was held in Gloucester, but owing to the very inclement weather, the attendance of members was not quite so good as usual. The report for 1909 presented by the Council was considered and adopted, the financial statement being considered very satisfactory. The officers for the present year were then elected as follows:—President, Mr. H. W. Chatters; vice-presidents, Mr. F. W. Waller and Mr. W. B. Wood; council, Mr. S. H. Healing, Mr. W. F. Jones, and Mr. T. Malvern; hon. secretary at Stroud, Mr. G. P. Milnes; hon. secretary at Gloucester, Mr. J. F. Trew; hon. general secretary and treasurer, Mr. T. Overbury. The meeting terminated with votes of thanks to the retiring officers for services rendered during the past year, and to those gentlemen who have been good enough to prepare lectures for the association.

The Junior Institution of Engineers.

At a recent meeting of this institution held at the Royal United Service Institution, Whitehall, a paper on "The Design and Running of Modern Cement Works," was read by Mr. Harry Horsburgh, Assoc.M.Inst.C.E. After a few historical references in introducing the subject, the progress made in methods of manufacture was dealt with, followed by a description of the Schneider Kiln process and that of the rotary dry kiln. An interesting table was given setting forth the comparative dimensions, output, etc., of various types of kilns, including that of Messrs. Edgar Allen and Co., of Sheffield, 150ft. long, the largest in this country, installed at Messrs. Forder's Cement Works at Sundon. An animated discussion followed, in which Messrs. John Speakman, Percy M. Stewart, D. B. Butler, G. V. Maxted, Arthur Verdon, J. W. Hinckley, J. H. Pearson, W. F. Carr-Hill, F. G. Robinson, R. Marshall, and W. Fennell took part. As a sequel to the paper, a large party of members afterwards visited Messrs. Forder's works, under the guidance of the managing director, Mr. P. M. Stewart, all the processes being shown in operation.

Liverpool Architectural Society.

Mr. Frederick Batchelor delivered a lecture on February 7th on "Architecture in Ireland." The lecturer referred to the curious structures of pre-Christian days, describing in interesting detail the strength and other qualities of the rude beehive huts, forts, and monastic retreats, and also the ecclesiastical edifices, which have survived the stress of centuries, and are being utilised for the purposes of modern times. The lecture was illustrated by a capital series of drawings and lantern slides, Mr. Batchelor being thus enabled to demonstrate how the Irish have reproduced in stone what they were so successful in reproducing in earlier days in metal work and illuminated manuscripts. The lecture, which had considerable archaeological, as well as architectural interest, concluded with a series of pictures of beautiful ceilings, still to be found in Dublin. On the proposition of Mr. T. E. Eccles (president), a vote of thanks was accorded the lecturer.

"THE COACH AND HORSES" HOTEL, HIGH STREET, WAL

ID. ARMSTRONG AND WRIGHT, FF.R.I.B.A., ARCHITECTS.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Mar. 1.	GLAZED BRICKWORK DESIGNS AND ESSAYS. A committee of glazed brick manufacturers invite designs for works to be executed in glazed brickwork, also essays as to the advantages to be derived from the use of this material in accordance with conditions to be obtained from J. Johnston Green, 142, Liverpool Road South, Southport. Premiums of 100 guineas, 50 guineas, and 25 guineas awarded to designs and essays jointly. Assessor, Mr. Max Clarke, F.R.I.B.A., appointed by the President R.I.B.A.
Mar. 31.	SHEFFIELD ENDCLIFFE PARK CHURCH. Plans desired for Church for 650, Institute for 150, Primary Department for 125, Junior Department for 95, and Caretaker's Apartments. Premium, not merged in commission, £35. Assessor, Chas. Hadfield, Esq., F.R.I.B.A., Delivery on March 31. On receipt of 5s. the Secretary, J. W. Nicholls, 64, Everton Road, Brocco Bank, Sheffield, will furnish conditions and instructions with plan of site, showing existing buildings, levels, and drainage—these not returnable. Deposit returned only to those who send plans.
Mar. 31.	MUNICIPAL OFFICES, KARACHI. The Municipality offer a premium of 7,500 rupees (£500) for the best design, detailed plans and estimates for new Municipal Offices. Cost not to exceed 500,000 rupees, and the style of architecture is left open to the designers. Ferrotype plans of the site and a general arrangement of the floors of the building showing the accommodation to be provided, together with a copy of instructions to architects, will be supplied to intending competitors on application to the Chief Officer and Chief Engineer, Karachi Municipality. A charge of Rs. 5 will be made therefor, which will not be refunded. Each set of drawings must be sent in anonymously, but accompanied by a sealed envelope containing the author's name and address. Each set of drawings and all the documents required, including the sealed envelope, must be securely packed in a wooden box, addressed as follows:—The Chief Officer and Chief Engineer, Karachi Municipality, Karachi, India, and forwarded, at the competitor's own risk and charges, in time to reach the Chief Officer on or before the 31st day of May, 1910. It is proposed to apply to Government for permission for one of the chief architects to act as assessor to decide on the design to which the prize shall be awarded. The final decision of the assessor will be final and not open to dispute. The decision of the Municipality will be made within three months of the latest date for submission of designs, and payment of one-half of the premium will be made thereafter to the author of the selected design, the balance to be paid when the further details specified in the instructions to architects have been supplied. On payment of the premium the Municipality will have all rights in the design, with power to erect the building under its own agency, either according to the design selected or with such additions or alterations as it may deem necessary.
No Date.	SECONDARY SCHOOL AT PETERBOROUGH, for Soke of Peterborough Education Authority, to accommodate 250 scholars, but allowing for enlargement so as to accommodate 300 scholars. Particulars of the general instructions and conditions, together with a plan of the site, may be obtained on application to Walter J. Deacon, Clerk to the Authority, Cross Street, Peterborough.

The Institution of Civil Engineers.

The competition, limited to six selected architects, for a design for the new buildings of the Institution of Civil Engineers, London, has been won by Mr. James Miller, A.R.S.A., of Glasgow. Four competitors were from London, one from Liverpool, and one from Glasgow. Each competitor received a fee of 200 guineas. The new buildings will be situated on the south side of Great George Street, Westminster, close to Storey's Gate, and are to replace the present buildings on the north side, which are to be pulled down to make way for the extension of the Local Government Board buildings. The cost of the new structure will be, it is said, over £100,000.

Linthorpe School, Middlesbrough.

The report of Messrs. Oliver, Leeson, and Wood, of Newcastle, who were appointed as assessors on the competitive plans for the proposed extensions to the Linthorpe Council Schools, has been delivered. Their award placed Mr. Jas. Forbes, Middlesbrough, first in order of merit; Messrs. R. Lofthouse and Sons, Middlesbrough, 2nd; Messrs. J. Bottomley and Welburn, 3rd; and Mr. A. Forrester, Middlesbrough, 4th. It was agreed that Mr. Forbes's plans be approved.

Girls' Secondary School, Peterborough.

The Secretary of the Royal Institute of British Architects desires us to announce that the Competitions Committee are in communication with the promoters of the above competition with a view to the amendment of the conditions.

The note published above shows that the Competition Committee of the Royal Institute are already negotiating for a revision of the conditions issued in this competition. The principal objections may be cited as follows:

(1) The sum of money allowed, £7,250, exclusive of electric fittings and furniture, is not sufficient to provide accommodation for 250 pupils and allow the possibility of enlargement to 300. The price per head at this figure does not exceed £29.

(2) The 4th clause—wherein it is stated "that it is the intention of the authority to appoint the author of the selected design to carry out the work, but the authority reserve to themselves freedom of action should they think it desirable to take any other course, and if the selected design is abandoned, the author thereof shall have no claim upon the authority."

(3) Cluase 5—which asks for half-inch scale detail and two perspective views taken from points marked with a cross on the site plan, in which the building is not to measure more than 15ins. across, and the drawing is to be in pencil with monochrome wash.

(4) Clause 13—which fixes the remuneration of the selected architect at the lump sum of £350, with railway expenses (third class) within a distance of 80 miles. This works out at less than 5 per cent. on the stipulated cost, which, it should be noted, does not include electric fittings or furniture.

(5) Clause 15—which states that "the authority will appoint an assessor as referee to assist them in deciding upon the designs and to advise them generally in regard to the competition, but the authority reserve to themselves the right of final selection." No premiums are offered. No extra remuneration is to be given for the various sets of designs required by the Board of Education, Town Council, Local Government Board, etc.

As the Royal Institute is now in communication with the Secretary of the Peterborough Education Committee, it would be advisable for architects to await the result of their negotiations before proceeding with the competition further.

Our Plate.

The "Coach and Horses," Wallsend.

This building stands in a prominent position in the High Street, Wallsend. The materials used were red bricks and stone dressings for the walls; roofs covered with dark red, sand-faced tiles, and metal casements and leaded lights for the windows. The porches are of teak, and the flèche is painted white. The purpose of this building, which was erected on the site of the old "Coach and Horses," was to provide refreshment for those engaged at the various yards on the river. The internal fittings throughout were designed by the architects. The work was carried out by Mr. Thos. Lumsden, of Jarrow. The perspective drawing, reproduced in the centre-plate, is by Mr. C. E. Mallows, and is a very beautiful specimen of his work.

CONCRETE INSTITUTE.

The election of six members of Council of the Concrete Institute has resulted in the return of three new members and the re-election of three of the old members. The new members are Prof. Henry Adams, M.Inst.C.E., M.I.Mech.E., M.S.A., etc.; Mr. E. Fiander Etchells, F.Phys.Soc., M.Math.A., A.M.I.Mech.E.; and Mr. William G. Kirkaldy, A.M.Inst.C.E. The members re-elected are: Mr. G. H. Colson, M.Inst.C.E.; Mr. William Dunn, F.R.I.B.A., and Mr. J. S. de Vesian, M.Inst.C.E., M.I.Mech.E.

THE "COACH AND HORSES" HOTEL, HIGH STREET, WALLSEND.
ARMSTRONG AND WRIGHT, FF.R.I.B.A., ARCHITECTS.
(See also centre-plate.)

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional, or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The Editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned, but enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies, or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s. made payable to Technical Journals, Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable; and it must be understood that both question and reply will, as a rule, be published in these columns

Cycling Sketching Tour in Holland.

A correspondent enquires if we can give him a list of places to visit in Holland; also the town most suitable for making his headquarters. Particulars as regards hotels and sketching permits would be esteemed. It is proposed to visit Holland at Easter and to start the tour at the Hook. Perhaps some of our readers can give this information.

Colouring Cement Floor.

With reference to the reply given to A. P. (Heckmondwike) on p. 92 of our issue of February 2nd, Messrs. Arthur L. Gibson and Co., Ltd., draw our attention to Cabot's waterproof cement stains, which are manufactured for the purpose. Particulars can be obtained from the firm at Radnor Works, Strawberry Vale, Twickenham.

Books on Chimney Shaft Construction.

J. B. (PORTSMOUTH) writes: "Can you kindly advise me of some recent work on chimney shaft construction?"

—The standard work on chimney construction is Bancroft's "Tall Chimney Construction" (Calvert: Manchester), but there may be some difficulty in getting a copy. A paper was read by Prof. Charnock in 1906 and printed in the "Engineering Times." Some further information will be found in "Specification" No. 9, p. 69 (Eyre Spottiswoode, 2s. 6d.), and in the "Builders' Journal" for March 4th, 1903, and September 18th, 1907. A paper on reinforced concrete chimney construction was read recently by E. R. Matthews at the Concrete Institute, and is being re-printed at the present time by various technical papers. HENRY ADAMS.

Partition Not Sound Proof.

W. N. G. (RUGBY) writes: "Can you advise me as to the best form of soundproof partition to substitute for a wooden partition panelled both sides, through which conversation can be heard, even with the communicating door closed?"

—Probably the best way of remedying the defect complained of in this case would be to take off the panelling on one side, fill the space between the studs with silicate cotton packed closely, put strips of Anderson's impregnated felt up the face of studs, and refix the panelling. A baize door should be fitted closely into the door opening on the opposite face to the present door. HENRY ADAMS.

Waterproofing Brick Floor.

W. M. E. (LONDON, S.E.) writes: "The ground floor passages and floor of a house have been paved with ordinary red paving bricks. Can they be treated with any waterproof solution which will waterproof them so that they can be washed without the water soaking into the bricks? It is also desired by the same or other solution to harden the bricks. Can this be done? The bricks are as well burned as they could be without being vitrified."

—There is no means of waterproofing bricks which is really so satisfactory as the use of properly made paving bricks, as any material applied to the surface will soon wear away. The bricks may be coated with water-glass (silicate of soda), which can be obtained cheaply from most chemists, and this will render it fairly waterproof. The house would, however, be much warmer and more comfortable if the bricks were covered with linoleum, and this would be more easily cleaned than the bricks themselves. Such a covering should last longer than several treatments of the bricks with the waterproofing material, and would not in the end prove any more costly. A. B. S.

Glazed Earthenware.

H. P. (TOLLINGTON PARK) writes: "Can you tell me the name of a book or books dealing with the history and general information of glazed earthenware, particularly with reference to glazed bricks?"

—Glazed earthenware is an entirely different material from that of which glazed bricks are made, and consequently no single book adequately deals with both these subjects. A movement has been on foot on the Continent for some years past with a view to utilising a porcelain mass for brickmaking, but it is too costly to be commercially successful. There is no really satisfactory book on the subject of glazed brick manufacture, though much assistance may be gained from "The Manufacture of Glazed Bricks and Sanitary Ware," by H. Ansell, published by H. G. Montgomery, 43, Essex Street, W.C., price 7s. 6d. "Bourry's Treatise on Ceramic Industries," published by Messrs. Scott, Greenwood and Son, 8, Broadway, Ludgate Hill, E.C., is one of the best in English for the general subject, but does not give sufficient details in regard to brick manufacture to be of practical value. The "Clayworkers' Handbook," published by Messrs. Charles Griffin and Co., Ltd., Exeter Street, Strand, W.C., deals with the subject from the point of view of the practical man, but does not deal with the "history." Any question relative to any special point may be answered through these columns, but before embarking on the manufacture of glazed bricks, a specialist should be consulted, as there are many pitfalls which are not obvious to the beginner in this line of manufacture. A. B. S.

Books for R.I.B.A. Intermediate.

H. C. (ABERGAVENNY) writes: "Kindly advise me what books to get for the Intermediate Examination of the R.I.B.A. I do not want expensive ones. Are the following of use:—"Art of Building" (Dobson and Alien), "Advanced Building Construction" (Wilson), "Gothic Stonework" (Davidson), "Gill's Geometry" "Practical Geometry" (Carroll)?"

—The following text-books will be found very useful in preparing for the R.I.B.A. Intermediate Examination:—1st, for history of architecture, Fletcher's History, Spiers' Orders, Anderson and Spiers' Greece and Rome, Parker's Introduction to Gothic, and the Glossary, Anderson's Italian Renaissance, Blomfield's (small) English Renaissance, and see note at end. 2nd, for construction, Mitchell's two vols., Elementary and Advanced Building Construction. The latter gives the necessary information on materials. 3rd, for geometry, there are numbers of text-books. Gill's Elementary Solid Geometry is as good as any for the purpose. 4th, for stresses and theoretical construction, Middleton's Stresses and Thrusts, Hardy's Graphic Statics (and Mitchell). We have mentioned the less expensive works only, by request, and we can only add that almost all these books can be replaced by others. Occasional study of larger works is very advisable, and reference to good books or plates of measured drawings, such as Collings' Gothic Detail, Gotch's "Early Renaissance," Belcher and Macartney's "Later Renaissance," should be made in the public libraries when possible. Most of the books mentioned in your list are of use.

Fletton Bricks.

F. L. R. (WALTON-ON-THAMES) writes: "I have received a letter from a builder raising doubts as to the durability of Fletton bricks. I should be glad to have your advice as to whether his view is correct, and if it would be advisable to use stocks instead."

—There are so many makers and qualities of Fletton bricks that a wholesale condemnation of all would be foolish, and whilst some of them are quite satisfactory and durable, others are exactly the opposite. It is in fact much more difficult to obtain a perfectly durable brick when using the process used for Flettons, than with that for stock bricks. The former are made by compressing a slightly dampened powder, and the latter by shaping a plastic paste in a mould, the true qualities of the clay being developed in this instance. Some builders have professed objection to using Fletton bricks because they have a dense surface and consequently do not adhere well to the mortar during the process of laying. When properly made, Fletton bricks are quite as good as ordinary stock bricks, and are equally durable, but they would have

Photo: Topical.

FIRE AT THE IMPERIAL LIGHTING CO.'S PREMISES, BLACKFRIARS ROAD.

This illustration shows the remarkable resistance of heavy timber construction. The wooden beam is that supporting the back main wall of the premises, and though it burned fiercely for half an hour, is still strong enough to uphold the load.

to be carefully specified in order to avoid any abuse of the name of "Fletton bricks." If the building is in or close to London, stock bricks of good quality will certainly be the more durable, as no brick yet made resists the peculiar climatic conditions of the Metropolis so well as a first-class stock brick, but outside this area, and to some extent within it, Flettons are proving quite satisfactory and are cheaper. A. B. S.

Dull Finish on Oak Half-timber.

S. S. (CROYDON) writes: "What is the usual and best method of treating solid half-timber work (oak), so as to obtain the dull finish and old effect?"

—The dull finish and silvery colour of old oakwork results from the surface of the wood being left from the tool, untreated in any way; and if new work is so left it will develop a similar effect after two or three years' exposure. G.

Alleged Encroachment.

H. H. (PALMER'S GREEN) writes: "As shown on sketch plan [not reproduced], A has built a house adjoining garden ground belonging to a railway company (B). The boundary between A and B is a post and rail fence (belonging to B), which is irregular and out of plumb. In building his house A took a line from x to x and built 4ins. from the line, to the face of his wall, with footings as shown in sketch. B now claims the face of wall as boundary, the fence rails touching it in places. (Q. 1). Can A demand to have the fence straightened? (Q. 2). In the event of encroachment being proved, can B be compelled to accept a lump sum as compensation? (They are now demanding a yearly payment as license for encroachment.) (Q. 3). If 'yes' to former query, on what basis should the sum be calculated? As the 4ins. which A claims is of no use to him, he would be willing to allow B to remove the fence for the length of the house, and use the face of walls as boundary. Can B reasonably refuse this? A's object is to avoid annual payment of any sum, however small."

—With regard to Q. 1, there seems to be nothing which would enable A to compel the railway company to straighten their fence, unless indeed it is out of plumb, in which case part of it may be technically trespassing on A's land. An action for "trespass" on this head might afford a convenient set-off to an action by the railway company for damages for the trespass alleged to be caused by the wall. As to Q. 2, it is difficult to see how the railway company could be compelled to accept a lump sum in compensation. If they did, the lapse of years would confirm A in his title to the piece of land on which he has encroached. The railway company could never re-assert their right to it. It is probable that they want only a shilling a year. A should make the best terms he can with them on this basis, for if they chose to sue him at law, a mandatory injunction might issue to compel him to pull down his building. With regard to the user of A's house as a boundary, the railway company are under no obligation in this regard if it does not suit them. B.

Vibration of House from Wind.

ARCHITECTUS (HEREFORD) writes): "I enclose sketch plan [not reproduced] of a house which was erected about 20 years ago. The tenants occupying same complain of a rocking or swaying motion during exceptionally high winds, chiefly on the bedroom and attic floors. This rocking does not happen very often, perhaps once or twice per year. I have made a careful examination of the premises and fail to find any cracks in the walls or ceiling, but the main walls (see plan) above ground level are only 9ins. thick, and the width being 15ft. 6ins. over all, makes a very narrow building, and you will note it is detached from adjoining property on both sides and therefore gets the force of the wind. The house is situated on fairly high ground, and is somewhat open at the back to the east winds. Is there any remedy to strengthen the building at a reasonable outlay, and do you consider the house liable to fall during severe winds?"

—The compass point was omitted on the plan, but if open at the back to the east winds the long sides of the building face to the north and south respectively. The further adjoining building is 14ft. away on the north side, but no height is given for this building. This distance is, however, so small that it is difficult to imagine the wind reaching a dangerous force. Although the house is said to rock during gales, this statement must be received with caution. It is astonishing how small a vibration appears excessive to one lying in bed. The writer was engaged in a law case some years ago where it was alleged that the vibration from a central power station in the neighbourhood was so great as to almost throw the occupants out of bed, while a seismograph gave no indication of vibration when all the engines were running, but did indicate the passing of a four-wheeled cab in the road at a distance of 120ft. In the present case the only useful addition that can be made would be to cross brace the partitions on the bedroom floor. But if the house has already stood twenty years, it will probably last its full time. The first effect of a high wind is generally to strip the roof covering and blow down the chimney stacks.

HENRY ADAMS.

FIRE AT MESSRS. B. MORRIS & CO.'S PREMISES, WHITECHAPEL, E.

The fire at these premises, which are those of a tobacco manufacturing firm, is another illustration of the danger of unprotected iron and steel-work. The sagging of the girders is clearly seen in the view.

Quantities.

STUDENT (CHILD'S HILL) writes: "1. In taking off quantities for a building, why is it customary to make no deduction of brickwork where a wall is faced with terra cotta, although the whole of wall is measured as solid brickwork? 2. In preparing a specimen drawing, if the 'pricker' is used freely the sheet of cartridge becomes rather unsightly. Which is the best way to minimise the bad appearance? If the cartridge is kept in damp atmosphere for a day or so, would the holes become invisible? 3. How does a mason work a perfectly true sphere from a cube of Bath stone? What labours should be taken for this in 'quantities'?"

—1. It is by no means customary to make no deduction of the brickwork when measuring terra cotta. "Leaning" states that the brickwork is not deducted, but many of the leading quantity surveyors are at variance with him, and treat terra cotta as stone, i.e., deduct the brickwork when measuring the facing and dressings. In any case it should be clearly stated in the bill which method has been adopted. 2. "Prickers," if carefully used, should not produce the unsightly appearance to which this correspondent refers. Keeping the drawing in a damp atmosphere would not be a difficult remedy. A better plan would be to turn over the cartridge paper and smooth it down with the thumb-nail, where bulges are caused by the pricker. 3. Spherical vaults or domes are seldom, if ever, worked in single stone, and are built up in courses, a mason's first operation being to divide both plan and section into the proper number of stones, and to draw the joints, of which the horizontal are portions of conic surfaces, and the vertical are planes tending towards the centre. The moulds for each course (commencing with the springing course) and the key-stone are found by

geometry, and the method of finding these is given in many of the leading books which deal with "masonry." "Nicholson's Practical Builder," published by Thomas Kelly in 1837 (although in many respects out of date) contains some excellent diagrams showing the construction of domes, niches, etc. Quantity surveyors measure the following labours after the total cube alone has been obtained :—Sunk joints to all edges of each stone. Circular circular face to the external surfaces of the spheres or domes. Circular circular face sunk to the internal surfaces. C.

Ruskin's Works.

T. J. G. (GUERNSEY) writes: "May I ask you to be good enough to let me know whether there is another book in the market known as 'Ruskin's Seven Lamps of Architecture,' besides the edition shown in your list and quoted at 1s. 6d.?"

—Since the copyright has expired on a number of the earlier editions of Ruskin's works, several publishers have brought out reprints in a cheap form. It should be explained, however, that Ruskin revised most of his books for fresh editions, and in many cases added foot notes amplifying or disapproving what he had previously written. These revised editions are still in copyright, and are published only by Messrs. George Allen and Son. Messrs. Allen have also issued a cheap edition, pocket size, of Ruskin's works, but the price of this is 2s. net for cloth bound copies.

R.I.B.A.

Town Planning Conference.

In view of the recent passing into law of the Housing and Town Planning Act, 1909, it is of the utmost importance that the architectural development of towns should receive the most careful consideration. The Royal Institute of British Architects has decided to organise a Conference to study the architectural problems involved in the improvement and extension of our cities. Members' co-operation is invited in this Conference, which will be held in London from the 11th to the 16th July, at the Royal Institute, 9, Conduit Street, Regent Street, London, W. His Majesty the King has graciously extended his patronage to the Conference. The programme of the Conference will include an exhibition of drawings, plans, models, and literature bearing upon the subject, and a large number of town plans and views will be displayed by means of lantern slides. It is expected that papers will be contributed by leading authorities on the various aspects of town planning, and that there will be a large number of visitors from the Continent and America in addition to those interested in the subject in this country. Membership of the Conference will be open to architects and all others, including ladies, interested in town planning. Members will be privileged to attend:—The inaugural meeting and the receptions that will be arranged; all the meetings of the Conference; the visits and the banquet (on payment of the necessary charges); and they will receive all the literature issued in connection with the Conference, including a copy of the illustrated volume of transactions to be published subsequently. The membership fee will be one guinea. If those interested in the Conference will apply to the secretary, the Royal Institute of British Architects, 9, Conduit Street, Regent Street, London, W., they will receive further particulars of the programme of the Conference, with a form of application for membership. As the number attending the Conference is necessarily limited, an early reply to the secretary is desirable.

BRITISH BRUSH MANUFACTURERS' ASSOCIATION.

The second annual dinner of this flourishing association was held at the Criterion Restaurant on Thursday last. The chair was taken by the President, Mr. Ernest N. Kent, of Messrs. G. B. Kent and Sons, who was supported by representatives of most of the leading firms of British manufacturers, including Messrs. Arthur Kent, C. A. Watkins, Ernest Watkins, F. G. Howard, Arthur Mason, C. F. Barrett, R. W. Chase, A. L. Burrow, and the secretary, Mr. T. Marson Till. In proposing the toast of the British Brush Manufacturers' Association, Mr. Kent said: "This association, as you know, has now been in existence for just two years, and is therefore little more than an infant in the matter of age. The infant, however, under the care of its excellent nurse, Mr. Till, is thriving, and showing much promise of leading a useful life in its particular sphere. This is the infant's second annual dinner, and many of you will have observed to-night how well it takes its nourishment—it is a 'good doer' in both senses of the word. I sincerely hope that as the child gets older its appetite may still improve. Some folks may think the child is growing precocious, and during the last year has been prying into other people's business, and suggesting how they should comport themselves. But at any rate, the association, I maintain, is a real benefit to the trade; and when the time comes, as I hope it may, when the question of tariffs in this country has to be discussed, the value of this cohesion of the members of our trade will be still more marked, and will prove of great advantage to every brush manufacturer in this kingdom; and that fact alone should induce all those brush manufacturers who are at heart interested in employing more hands, and increasing the manufacturing portion of their business, to join our association."

Mr. C. A. Watkins, in acknowledging the toast, dwelt on the necessity for such an association, and showed how it had already proved a real success to the manufacturers. Other toasts, including "The President" and "The Visitors," were duly honoured, and a most enjoyable musical programme was provided by Messrs. Frank Hicks, J. W. Dear and W. Wurtsburg. Although not on the official programme, a series of recitations by Mr. Arthur Kent proved quite the feature of a really excellent entertainment.

We reproduce the vigorous and fantastic design with which Mr. Arthur Rackham adorned the menu card.

Alderman Stephenson, of the Sheffield City Council, proposes that as the Town Planning Bill has now become law, the Special Committee appointed by the City Council to deal therewith on January 13th, 1909, be dissolved; that the exercise of the powers of part 1 of the Housing, Town Planning, etc., Act, 1909, as to housing be vested in the Estates Committee; that the exercise of the powers of part 2 of such Act as to Town Planning be vested in the Improvement Committee, with authority to both committees to confer from time to time if deemed advisable, and also on the part of the Improvement Committee, so far as Town Planning is concerned, if deemed advisable to confer with such outside professional persons as may be considered helpful, or with the authorised representatives of the Sheffield Society of Architects.

DRAWING BY ARTHUR RACKHAM ON THE MENU CARD AT THE DINNER OF THE BRITISH BRUSH MANUFACTURERS' ASSOCIATION.

Fire Prevention Notes.

Automatic Protection. Automatic protection, we are rather surprised to learn, has been hitherto more commonly adopted in the provinces and in the colonies than in London, where, it is reported, sprinklers are being but slowly installed in existing establishments, although the necessity for installing them in new buildings is far more generally recognised. The public ignorance on the subject may be inferred from the fact that, in referring to a recent fire, a London newspaper threw off the amazing statement that sprinklers were introduced into this country about five years ago! Mr. William Whiteley, noticing this statement, has pointed out that sprinklers in his vast establishment were installed more than twenty years ago; and it may be added that even then this system had been in use elsewhere for quite ten years.

"Life" of Sprinkler Installations. What is the life of a sprinkler installation? The question is asked and answered in the "Sprinkler Bulletin," a quarterly journal published in the interests of the system. The answer is, broadly speaking, that a sprinkler installation will last as long as the building in which it is fixed. It is contended that water that is without movement in a pipe, and is unassisted by atmospheric action, is practically non-corrosive. It has been found that, even in plants fifteen or twenty years old, the corrosion is inappreciable. In the exceptional cases in which special atmospheric conditions tend to set up external corrosion of pipes, a coat or two of paint is usually found to afford sufficient protection. It is claimed that, given properly constructed pumps, pressure tanks, and hydraulic injectors, and the same amount of attention that is given as a matter of course to the building, it is hard to say which will wear out first, the building or the sprinkler installation.

Fire-Resisting Economy. In the United States, confidence in fire-resisting construction has become so firm that the owners of buildings of up-to-date construction are abstaining from insurance. Our own Metropolitan Asylums Board seems disposed to adopt a similar course. At a recent meeting of the Board, it was unanimously resolved to abstain in future from insurance against risk of loss by fire. The Finance Committee had pointed out, in a report, that in the last six years £14,750 had been paid for insurance, and only £205 was received for claims; while, last year alone, £2,550 was paid in premiums, and only £10 was received in claims. The property concerned was considered to be much less hazardous than the average risks undertaken by fire insurance companies, the majority of the buildings being solid brick, in many cases with fireproof floors, and the risk from fire is thought to be infinitesimal. A few instances such as this should induce the insurance companies to reduce their rates proportionately to the risk, and will, moreover, tend to convince building owners of the truth of the contention so often put forward in these columns—that in the long run it is more economical to adopt modern fire-resisting methods.

How Flues Cause Fires. Experto crede! "A practical sweep" writes to a London morning paper a very sensible letter in which he contends that usually it is not the small fire left in the grate that sets the house ablaze. In nearly every case, he declares, fires are due to the wearing away of the brickwork at the back of the stove, and the falling of burning soot on to the wooden scantling behind the grate. He adds that he has often tried to persuade householders to have the back filled in with cement or stone so as to obviate this danger. The advice is excellent in its way, but ought not to be necessary. Where flues are properly constructed, all danger from fire is foreseen and obviated; but this gentleman has unique opportunities of observation, and not only is he able to make astute inferences from them, but he has the public spirit to place them at the service of all whom they may concern. Presumably the buildings to which he refers are very old, for the danger he indicates does not suggest modern construction.

A Fire-Master's Views. In the course of a recent lecture delivered to students of the Heriot-Watt College, Mr. A. Pordage, Firemaster of Edinburgh, contended that the aim of constructors should be in the direction of retarding the spread of fire. His view was to build as far as possible in sections with brick party walls running up through each section and through the roof, to avoid heavy construction for roofs, not to seek to confine the fire and compel it to spread, but to get it away through the roof. This applied particularly to theatre construction. In the construction of modern buildings on fire-resisting lines, it was his opinion that in aiming at building the structure with a minimum degree of risk from destruction by fire, sufficient attention was not paid to the matter of excessive loads on walls. The principal causes of the destruction of presumably fireproof buildings when attacked by fire was not so much due to the effects of fire as to wreckage due to the collapse and failure of parts of the structure. It was a mistake to attempt to confine a fire within the limits of a particular floor, and in order to assist the fire in getting out of a building they might provide special shafts to carry it up through the roof into the outer air instead of assisting it to spread laterally through the various floors.

Fire Danger. In a letter under this heading, addressed to the editor of a weekly newspaper, the question is asked: Is not a good deal of the blame in connection with the above due to the architects? They are, this correspondent declares, as a profession becoming more and more notorious as artists rather than practical building designers. Architects will not admit that this accusation is just. The fact is that they are, in this respect as in most others, far in advance of their clients, whom it is difficult to persuade to adopt such precautions as seem to entail extra initial outlay. Another correspondent (a lady) more usefully points out the necessity of making all decorations in shops safe from fire, which, she contends, is certainly one of the things that the authorities ought to insist upon. She states from experience that it is an easy and cheap matter to carry out, as for over a year she has made use of a preparation sold for the purpose, and makes a point of having all curtains soaked in this. If it were more generally known that this safeguard can be obtained at a cost of about 3d. for a large curtain, people with children would have it carried out for their own protection, but in any case its use should be compulsory in the case of decorating large shops. Yet a third correspondent complains that, while thousands of pounds annually of public money are spent to maintain a fire brigade—a very efficient force, no one can deny—prevention is of paramount importance, and is unquestionably possible to-day. He seems to think that in our present state of knowledge large and serious fires should be impossible; and we are quite disposed to agree with him The difficulty is, as we have said, to persuade owners to act on that knowledge.

We are informed by Messrs. James H. Tozer and Son, Ltd., of York Mansion, York Street, Westminster, and by Mr. Percy Tomey, that the latter gentleman no longer represents that firm as agent, engineer, or manager of the reinforced concrete department of their business.

Correspondence.

[*The Editor declines responsibility for the statements made or opinions expressed by correspondents.*]

The Provision of Quantities.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Having seen in your valuable journal correspondence and reports of meetings relating to the practice of architects obtaining tenders for works without supplying "quantities" for same, may I be allowed to state the case from an estimator's point of view? First, I thoroughly endorse the suggestion made that builders should combine with the idea of refusing to tender unless quantities are supplied for jobs of the value of, say, £500 and upwards. Especially at the present time, when the building trade is suffering from severe depression, the builders in their endeavour to obtain work and keep in touch with architects are necessarily obliged to quote for any and every job they can possibly get enquiries for. Consequently their estimating staff, never too large, have additional duties forced upon them, particularly when quantities are not supplied, often necessitating a continuous application to their work early and late for weeks on end, and for which they receive no extra pay. This results in many cases in hurried work, and exemplifying the oft-repeated saying, "that the man who makes the biggest mistake gets the job."

I think you will agree with me that this is a state of things that should and could be amended, in fairness to the surveyors, their clients, and the building world generally. My own experience tells me that the worst offenders are the L.C.C. (both educational and other departments), the Office of Works, and the Borough Councils. These bodies without exception insert the "fair wages" clause in their contracts, but little thought is given to the builders or their clerical staff.

Should the Q.S.A. and their able president, who have recently brought this matter to the front, meet with the support they deserve, I am convinced the builders will welcome it, clients will get a better and more just treatment, and endless litigation be saved.

ESTIMATING CLERK.

The Local Government Board and Reinforced Concrete.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The attitude of the Local Government Board in refusing to allow loans to local authorities for the construction of works in reinforced concrete on the same terms as in cases where other materials are used, is by this time sufficiently notorious. But we think that the hardship inflicted upon small local authorities, and upon firms such as our own, whose business it is to design or carry out work in the material, is not fully appreciated. We should like, therefore, to call attention to a recent case (which is far from being an isolated one) in which we have received a letter from our client stating that he has just been informed by the Local Government Board that only ten years can be allowed for a loan with which a reinforced concrete tank was to be constructed, and that therefore the project must be abandoned. Several designs for this tank have been prepared by us, and negotiations have been continued between the contractor, our client, and ourselves for some months; yet when these have been brought to a conclusion that, owing to the economy both in original cost and up-keep of reinforced concrete as compared with any other material, is eminently satisfactory to the would-be owners of the tank, the whole of the trouble and expense are absolutely thrown away in consequence of the action of the Local Government Board. In addition to the waste of labour thus caused, the Local Government Board are preventing the local authorities in question from reaping the benefit of the

economy and other advantages of this material

That such advantages do actually exist, and are not merely the product of imagination, is sufficiently proved by the action of the Admiralty, War Office, Board of Works, railway companies, and large commercial firms, who have to such a large and increasing extent embarked upon the use of reinforced concrete.

It is absurd to suppose that such bodies would adopt a material whose life was supposed by their technical advisers to be only ten years. Up to the present, deputations, correspondence, and personal interviews have all met with the same fate, and have proved to be utterly ineffectual in obtaining the necessary consideration.

Surely when the consensus of professional opinion is so clearly against the action of the Local Government Board, it would be to the public advantage if a committee of independent experts were appointed by the President to advise him as to whether that action is in accordance with the accepted opinion of the engineering profession.

Yours faithfully,
THE PATENT INDENTED STEEL BAR COMPANY, LTD.

The Warming and Ventilating of Public Buildings.

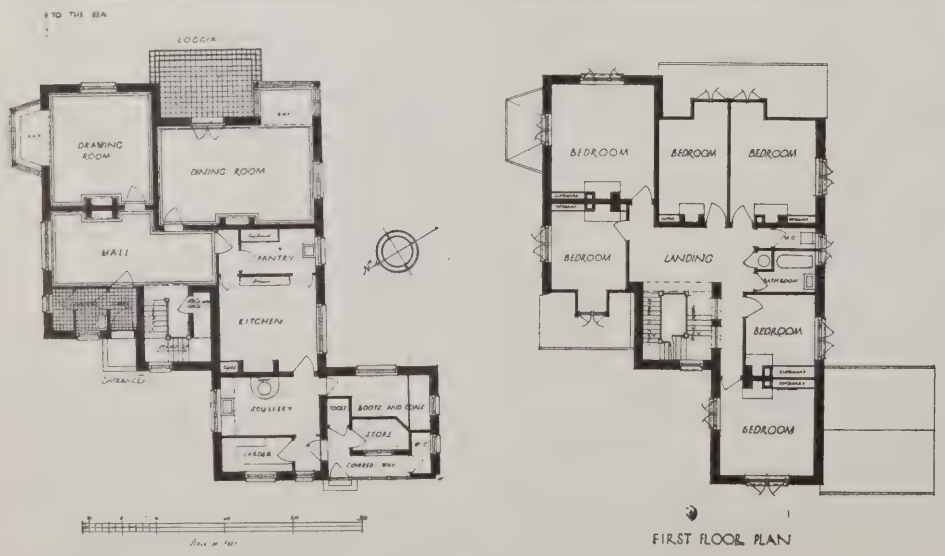
To the Editor of THE BUILDERS' JOURNAL.

SIR,—We notice in the current issue of the "Builders' Journal" an article upon "The Warming and Ventilating of Public Buildings and Factories," by Mr. T. W. Aldwincle, F.R.I.B.A., wherein the cable system is referred to. As licensees of this system, we should be pleased to forward full information to any of your readers interested in modern and economical methods of heating.

J. T. PHILLIPS AND SON.
21, Old Queen Street, Westminster, S.W.

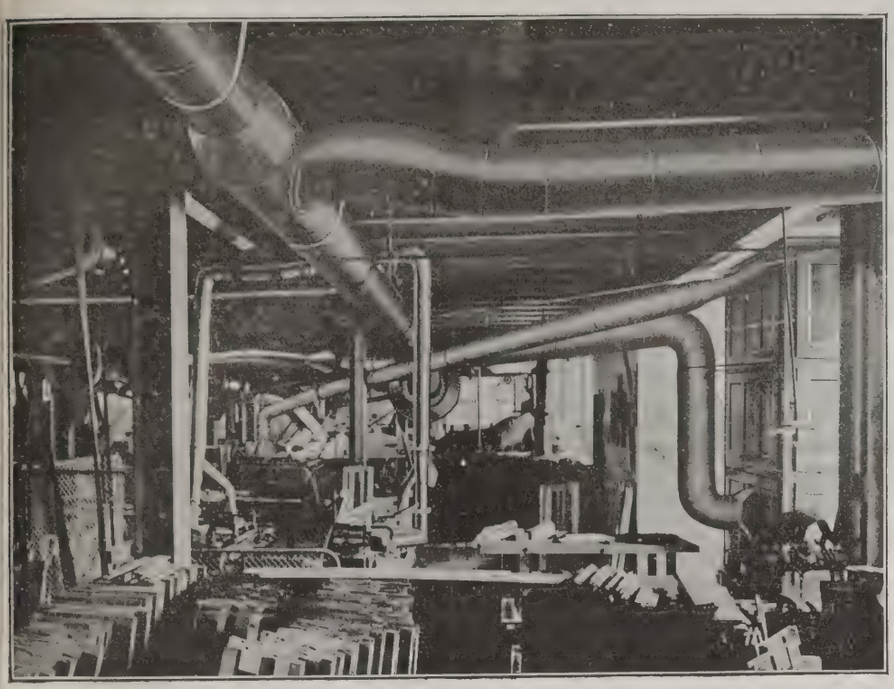
CARPENTERS' HALL LECTURES.

The Joiner's Craft.



Sir A. Brumwell Thomas lectured on Wednesday week at the Carpenters' Hall on the craft of the joiner. If there is one thing which interests us all it is English woodwork, on which we as a nation pride ourselves. When this lecture was preceded by one on carpentry, it became a hard matter to decide how much English woodwork was joinery, and how much carpentry. The lecturer then recounted a controversy which took place between the Carpenters' Company and the newly-incorporated Guild of Joiners, and the dispute settled by a Court of Aldermen of the City of London. The dispute arose over the question as to what work belonged to the carpenter and what to the joiner. The resulting decision was that the joiner's craft was included in that of carpentry. The crafts of this country have received two strong artistic impulses, the first from France, followed by three centuries of mediæval art; the second from Italy resulting in three centuries of Renaissance work. The character of the work and the mode of expression of each differ distinctly. In the 13th, 14th, and 15th centuries stone was the chief material, and the woodwork of these periods closely follows the stonework both in design and workmanship. One of the oldest pieces of joiner's work in the kingdom is the Coronation chair in Westminster Abbey, which belongs to the great Edwardian period, and on which the stonework influence can be clearly seen. The choir stalls and pulpit from Winchester Cathedral also show this influence, and the backs of the stalls are nothing more than traceried windows constructed in wood. The Bishops' throne at Exeter is about the most beautiful and richest example of the joiner's craft we possess. The 15th century was remarkable for its wealth of woodwork, and a screen from Devonshire, of which a slide was shown, consisted of several openings, each one a perfect traceried window, with fan vaulting

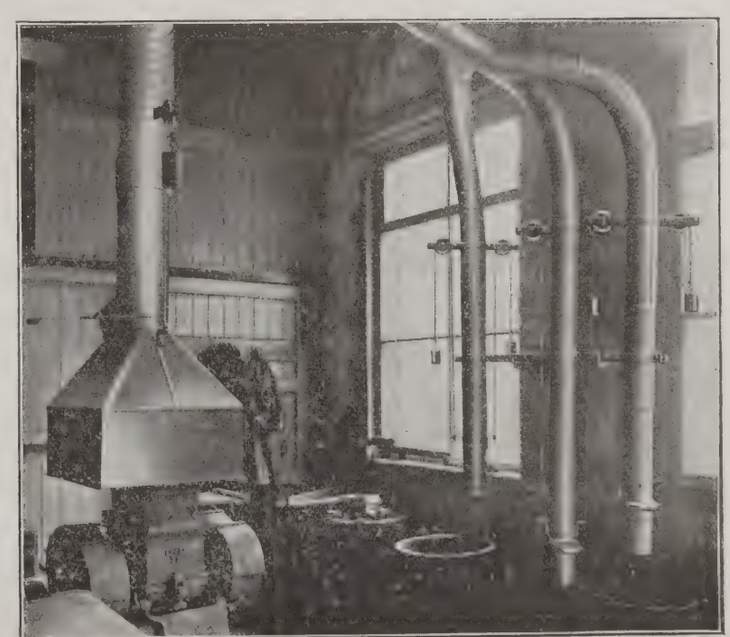
This completed the remarks of the lecturer on the mediæval period. We now come, he said, to the Renaissance. Henry VIII, like the young King Francis of France, was a great patron of art, and the employment by him of Italian workmen began to influence the work of the period. The screen from King's College, Cambridge, clearly shows this Italian influence, and must have been executed by Italian workmen, as the English craftsmen had not yet attained such perfection in the new style. With the reign of Elizabeth, the country being at rest and free from strife, brought a desire for more comfort, and the ambition of all seems to have been a desire to build the finest house. Audley End, though only part now remains of the original building, is yet a fine stately mansion. An interior view was shown, in which the German influence could be seen, by the caryatide figures, etc., and the flat ceiling divided up into panels and filled with enriched plasterwork, which marks the transition from the open mediæval roofs dealt with last week. Many of the screens which were a feature of the work of this period remain at the Colleges at Oxford and Cambridge. Another interesting feature of the work of this period is the internal porch in a room designed to give access between two other rooms without passing through the third. Broughton Castle, Oxfordshire, possesses a good example, which was shown also one at Red Lodge in Bristol. The dining room door of Levens Hall, Westmoreland is a very fine example of the work of the period, with caryatide figures on each side, and the owner's arms over. The fireplace at Blickling Hall is also characteristic of the work of the time. Here again are caryatides on each side of the family arms. Passing on with the development of house planning a broad and easy wood staircase became a feature. That at Castle Ashby shows how the craftsman lavished all his care on the fretted panels and carved newels, also the staircase from Hatfield House, in Hertfordshire, the home of the Cecil family, has newels elaborately carved with strap ornament, and terminated with carved figures. This is a very picturesque period in English craftsmanship, but these staircases overladen with ornament show no originality in design.



HOUSE AT HOPE POINT. KINGSDOWN, DOVER. J. A. BESSANT, ARCHITECT.

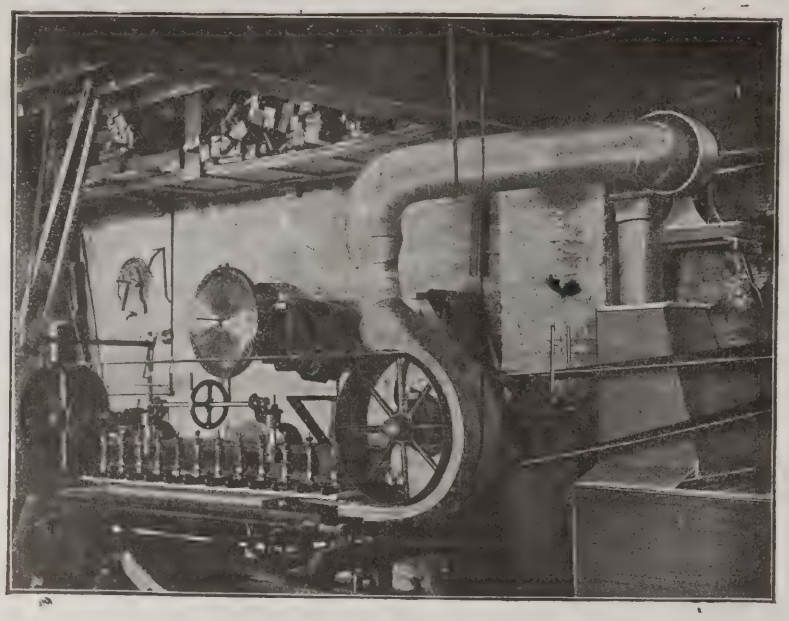
This house was erected in 1907. The site commanding magnificent views of the Channel, the rooms were arranged to take the fullest advantage of the outlook. The walls are hollow built, 16 ins. thick, of brick treated with cement roughcast. The roof is covered with red sand-faced tiles. The floors generally are of red jarrah unpolished and laid in narrow widths. The staircase is of oak with jarrah treads and risers. There are six bedrooms on the first floor and a room in the tower accessible from the first floor. The house is lighted throughout by means of Cox's air gas, The contractors were Messrs. G. H. Denne and Son, of Deal,

HOUSE AT HOPE POINT, KINGSDOWN, DOVER. J. A. BESSANT, ARCHITECT.



DUST REMOVAL IN WOODWORKING FACTORY, SHOWING SIROCCO FAN SUSPENDED FROM CEILING.

The carpenter relied on pattern book methods for gaining effect. At the end of the century, with the advent of Inigo Jones, the design of the work passed from the craftsman to the designer. Nothing much is known of Inigo Jones except that he travelled in Italy. Wilton House, in Wiltshire, exhibits features in design probably unsurpassed, while Ashburnham House is a delightful piece of planning, especially the staircase, and a door on the landing, of which a slide was given, shows great refinement. Inigo Jones's great successor was a man full of scholarship. Sir Christopher Wren was almost an amateur, but when the time came he was found to be the man. Much of his work was shown, including the organ case at St. Paul's, which the lecturer said is a most beautiful design, and will stand as a monument to the skill of the craftsman who built it. There is scarcely a crack or an open joint in the whole case, in spite of the time it has been standing. In the choir stalls the great projection of the carving was noticed. In early work, no such heavy construction in wood was tried. The construction of the joinery here is a feature of the work. The screens in the ambulatory and the chapel at the western end of St. Paul's, were also shown. There are two very charming doorways, beautifully carved, in Laurence Pountney Lane, while a fine example of the wall panelling from Clifford's Inn, designed on broad lines, is now in South Kensington Museum. The Court Room of the Brewers' Hall has some fine bolection mouldings, while the screen at the end of the hall of the Brewers' Company should be noted. Continuing, the lecturer remarked that this period which we have just passed is the summit of the joiner's craft, but if the work at the end of the century lacked inspiration, it certainly also lacked some of the excesses which we see in the work on the Continent. To-day there is a tendency to take up the wholesome tradition of this period. The lecturer next showed several examples of modern work, including the Council Chamber from Woolwich Town Hall, also a suite of committee rooms, the Lord Mayor's dais at Belfast City Hall, the whole richly carved with pierced panels; the reception room leading to the Council Chamber, and the committee room also at the Belfast City Hall, panelled in oak and containing a very large table made in four parts easily detached. Some examples of modern woodwork designed by Mr. Belcher in a London town house, and carried out by Messrs. Trollope and Sons, followed, also a view of the Council Chamber at Cardiff with inlaid wall panelling designed by Messrs. Lanchester and Rickards, some details and furniture of a house by Mr. Voysey; a house near London, designed by Mr. Dawber, and a panelled room by Mr. Lutyens, carried out in deal painted white. In conclusion, the lecturer pointed out that there is a difference between mediæval work and that of a later period. The earlier work is all carved out of the solid wood, but from the 16th century onwards the work is built up. In the earlier period the panel mouldings were worked on the solid, the stiles meeting at the angles in masons' joints. Then later came the true mitre still worked on the solid, followed later still by mouldings planted on. In conclusion, what about our original enquiry—where does the work of carpentry end and that of joinery begin? In early days we find in one man all the qualities which to-day are distributed over various trades and crafts.



DUST REMOVAL IN JOINERIES AND WORKSHOPS.

The removal of dust, shavings, and chips from the machines and floors of woodworking factories is essential, not only for the purpose of freeing the tools, but for the all important necessity of reducing the fire risk. A lighted match, carelessly thrown down, may start some sawdust quietly smouldering without smoke until a puff of wind fans it into a blaze, which will reach something more inflammable, and convert the factory into a furnace.

Owners of modern woodworking factories, realising that shops free from shavings, etc., represent an annual saving on account of the reduced insurance tariffs, are installing special exhaust plants, consisting of fans and ductwork, which remove all shavings and chips as soon as they are produced by the machines. The fan required for this purpose must be of a special type, as it must not only be capable of setting up a strong suction which will draw away the material through an extended system of piping, but also be so designed that it will not become choked by the dust and shavings, or the wheel damaged by the impact of small blocks of wood. A type of fan used for this purpose, which may be applied in small sizes to a single machine as illustrated on p. 138, or arranged to serve, in its larger sizes, a series of different tools by means of pipework, as shown below. To collect the dust after it has passed the fan, a cyclone collector is usually employed, but in the case of sandpapering machines, which give off a quantity of very fine flour-like dust, special precautions have to be taken, necessitating the use of a special collector, as this class of dust shows the utmost aversion to being sifted from the air.

DUST REMOVAL FROM MIXER AND BARRELS.

SIROCCO FAN REMOVING DUST FROM SANDPAPERING MACHINE.

There are many operations in the manufacture of paints, such as the emptying and filling of barrels or bins, the sieving of colours, the grinding and mixing, in which a considerable amount of dust is produced, necessitating the provision of adequate exhaust draught arrangements. Over hoppers and shoots feeding the different machines, hoods must be carefully arranged, so as to localise the exhaust as much as possible, while the dust caused by shovelling or scooping the material into bins must be removed in such a manner that it does not reach the breathing level of the worker. In the mixers and grinders, the suction should only be just sufficient to prevent the dust from spreading into the room, as a very strong draught would draw up too much dust. The second illustration on p. 137 shows the arrangement adopted for removing dust from a mixing machine and from barrels. The three vertical pipes and the hood, which can all be raised or lowered at will, are connected to a small "Sirocco" fan requiring about half a horsepower for its operation.

Trade and Craft.

Stoniflex Felt and Sideroleum Wood Preservative.

Stoniflex felt has been upon the market for the last ten years, and is now known throughout the United Kingdom as a most durable and lasting felt, as, instead of becoming brittle as time goes on, it toughens, and becomes like leather. Its great advantage is that when once carefully laid and given a coat of mastic, it will not require any further attention for some years, and does not need constant yearly tarring. It has been used for roofing many of the largest factories in the kingdom, as well as schools, football stands, and other buildings, and we are informed that during the present skating rink craze, rinks all over the country have been covered with it. It does not contain coal-tar or pitch, is rubber-like, densely compressed, never sticks, does not crack, and is pliable in all temperatures. It is light as well as durable, and is proof against attack by the white ant. A folding card, with samples affixed, may be obtained from the sole manufacturers, Messrs. D. Anderson and Son, Ltd., Lagan Works, Belfast, and Roach Road, Old Ford, London, E.

The same firm have recently issued a catalogue containing about a dozen illustrations, printed in colours, to show the appearance of their "Sideroleum" in various applications, such as fencing, half-timber work, etc. Sideroleum penetrates deeply into the pores of the wood, and protects it against all forms of decay, as well as against vermin. It also serves the same purpose with stone and brickwork. The standard colour is a very pleasing nut-brown, which, however, can be modified to order.

Coming Events.

Wednesday, February 16.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. D. Y. Cameron on "Gothic Architecture," 8 p.m.

CARPENTERS' HALL LECTURES. — Mr. Lawrence Weaver on "The Art of the Leadworker," 7.30 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION.—Mr. F. W. Rich, on "The Flavian Amphitheatre, commonly called the Colosseum, Rome," 7.30 p.m.

Thursday, February 17.

R.I.B.A.—Literature Committee Meeting.

THE ROYAL SANITARY INSTITUTE LECTURES.—Mr. Wellesley Harris on "The Duties of a Sanitary Inspector," 7 p.m.

ROYAL SOCIETY OF ARTS (Indian section).—Mr. G. W. Dunn, on "The Bombay Housing Question," 4.30 p.m.

SOCIETY OF ANTIQUARIES.—Burlington House meeting, 8.30 p.m.

INSTITUTION OF ELECTRICAL ENGINEERS.—Mr. F. Hope-Jones, on "Electric Clocks," 8 p.m.

ROYAL INSTITUTION.—Professor Silvanus Thompson. First lecture on "Illumination," 3 p.m.

Friday, February 18.

THE ARCHITECTURAL ASSOCIATION. — Mr. E. Swinfen Harris on "The Life and Work of William Butterfield," 7.30 p.m.

THE ROYAL SANITARY INSTITUTE LECTURES.—Mr. Wellesley Harris on "The Duties of a Sanitary Inspector," 7 p.m.

LEICESTER AND LEICESTERSHIRE SOCIETY OF ARCHITECTS.—Mr. S. Perkins Pick on "Drainage and Sanitary Fittings," 8 p.m. at 5, St. Martin's East.

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS (Southampton Row, W.C.).—Mr. E. F. Strange on "Book Ornament," 6 p.m.

INSTITUTION OF MECHANICAL ENGINEERS.—Annual General Meeting. Election of President and Officers. Report of the Council. Adjourned Discussion on 9th Report of Alloys Research Committee, 8 p.m.

INSTITUTION OF CIVIL ENGINEERS.—Students' lecture. Sir R. Hanbury Brown, on "Irrigation Works," 8 p.m.

Saturday, February 19.

ABERDEEN ARCHITECTURAL ASSOCIATION.—Mr. J. A. Ogg Allan on "A Recent Architectural Tour in the United States," 7.30 p.m.

BIRMINGHAM MUNICIPAL SCHOOL OF ART.—Exhibition of Students' Work at the Rooms of Royal Society of Artists, New Street. Closes 10 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Visit to Edinburgh and District Water Trust's New Filter Works, Fairmilehead.

Monday, February 21.

THE SURVEYORS' INSTITUTION.—Mr. R. D. M. Saunders on "Land Banks and Small Holdings," 5 p.m.

INSTITUTION OF SANITARY ENGINEERS.—President's Address, 8 p.m.

Tuesday, February 22.

UNIVERSITY EXTENSION LECTURES ON ANCIENT ARCHITECTURE. — Mr. Banister Fletcher on "Palaces of the Roman Emperors, Roman Dwelling-houses; Pompeii and Pompeian Decoration," British Museum, 4.30 p.m.

INSTITUTION OF SANITARY ENGINEERS.—Students' lecture. Mr. G. W. Chilvers, on "The Ventilation of Dwellings and Public Buildings," 7 p.m.

Wednesday, February 23.

CARPENTERS' HALL LECTURES. — Mr. Geo. P. Bankart on "The Art of the Plasterer." 7.30 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION.—Students' Meeting. Mr. W. Milburn, jun., on "Notes on Continental Hospitals," 7.30 p.m.

Thursday, February 24.

LONDON MASTER BUILDERS' ASSOCIATION.—Annual dinner.

Friday, February 25.

THE ARCHITECTURAL ASSOCIATION DEBATING SOCIETY.—"That the Employment of a Quantity Surveyor is to the Interest of the Building Owner," Mr. Percy Gleed, R.A.S.I., for; Mr. S. L. Dale, A.R.I.B.A., against, 7 p.m.

CAMBERWELL SCHOOL OF ARTS AND CRAFTS.—Annual Exhibition of Students' Work at South London Art Gallery, closes at 10 p.m.

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS (Southampton Row, W.C.).—Mr. W. W. Watts' First Lecture on "The History and Development of English Silversmiths' Work," 6 p.m.

ROYAL SANITARY INSTITUTE.—Provincial meeting, Derby, at County Offices, St. Mary's Gate. Mr. G. H. Widdows, on "Derbyshire Elementary Schools: Principles of Planning," 7.30 p.m.

Saturday, February 26.

ROYAL SANITARY INSTITUTE.—Provincial meeting, Derby. Visits to Derbyshire County Schools at Langley Mill, Sandiacre and Long Eaton; also in Borough of Derby.

Monday, February 28.

THE ROYAL SANITARY INSTITUTE LECTURES.—Mr. E. J. Steegmann on "Elementary Science," 7 p.m.

R.I.B.A.—General and Business Meeting. Election of the Royal Gold Medallist. Election of members.

THE SURVEYORS' INSTITUTION. — Junior meeting. Mr. E. A. Rogers, on "Prospects in Municipal Surveying," 7 p.m.

Tuesday, March 1.

UNIVERSITY EXTENSION LECTURES ON ANCIENT ARCHITECTURE. — Mr. Banister Fletcher on "Early Christian Architecture (A.D. 4th century to A.D. 6th century)," British Museum, 4.30 p.m.

INSTITUTION OF SANITARY ENGINEERS.—Students' lecture. Mr. Nandy Hoskins on "Sanitary Law," 7 p.m.

Wednesday, March 2.

CARPENTERS' HALL LECTURES.—Mr. C. F. A. Voysey, on "Castles in the Air," 7.30 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION.—Council meeting, 7 p.m. Ordinary meeting, 7.30 p.m. Paper by Mr. Joseph Oswald.

THE ROYAL SANITARY INSTITUTE LECTURES.—Mr. E. J. Steegmann on "Elementary Science," 7 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. J. H. Stevenson on "Heraldry as Applied to Architecture," 8 p.m.

R.I.B.A.—Art Committee Meeting.

ANDERSON'S FLAT ROOFING.

Specify "STONIFLEX,"

THAT IS IF YOU WISH TO HAVE ROOFING THAT IS WEATHER AND FIREPROOF AND QUITE

UNAFFECTED BY SETTLEMENT.

"STONIFLEX" Flat Roofing represents an economical, safe and easily laid roofing. Valuable for private houses and public buildings. Lasts longest, is therefore cheapest. Send for full particulars.

D. ANDERSON & SON, Room 8, Roach Road, Old Ford, London, E.

RESISTS FIRE, FROST, RAIN, SNOW.

How far ahead you get in your work—and how much money you make—Depends entirely upon you!

The opportunities in every modern line of business—of commercial, technical and scientific endeavour of all kinds are really unlimited.

It is the men with the necessary training who are not available.

Any manufacturer—any proprietor of any thriving business forced to meet competition every hour—will tell you that the finding of men with a thorough understanding of specialised lines of work is his greatest problem.

We have letters from business houses as proof. Similarly, we have thousands of letters from ambitious men and women, who, having completed specialised courses of study in the I.C.S. have been eagerly snapped up by just this sort of employer. Let us refer you to successful students in your district.

Better positions—higher pay—that, in a nutshell, is the result of an I.C.S. training. It is the thorough, practical, step-by-step grounding in every department of a given line which makes the I.C.S. training the only one of its sort in existence.

No classes to attend—no books or apparatus to buy—not a lesson missed—no interference with your work or your pleasure—and the Students' Aid Department at the back of you when you have completed your course.

Let us send you, free of any obligation, facts which will open your eyes.

Simply mark on the coupon at foot what line interests you most, and post it to the International Correspondence Schools, Ltd., Dept. 156B., Kingsway, W.C. Your choice of over 120 courses.

Fulwell Hydrated Lime.

A high-class Lime, slaked by a patent process, and packed in bags. Saves the labour of washing and running the lime, will not blow, leaves no waste, may be stored without deterioration and without bursting the bags.

For mouldings and lathwork can be gauged with a much smaller proportion of plaster than ordinary lime.

Converts lime into a safe, reliable and convenient material with the advantages of a bagged plaster.

Further Particulars and Samples from:—

The Exors. of the Late
Sir HEDWORTH WILIAMSON, Bart.,

A MOST IMPORTANT BOOK ON PAINT.
"OXIDE OF ZINC:
Its Nature Properties and Uses."
By J. CRUICKSHANK SMITH, B.Sc., F.C.S.
The remarkable increase in the use of Oxide of Zinc Paint during recent years, owing to the fact that it is innocuous and exceedingly durable, renders this book of great interest to Architects, Builders, Decorators, and others.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about **five days** or longer after the date of this issue.
Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders.
The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the Contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Feb. 4—25. **BELLSHILL (Lanark).**—Erection of buildings to contain refuse destructor; also steel chimney stack; provision of water supply and drainage, and formation of access road and other relative works at Boggs Brae, near Bellshill, for the C.C. Plans may be seen, and copies of specification and schedule of measurement obtained at the office of W. L. Douglass, C.E., District Engineer, District Offices, Hamilton, on deposit of £1. An assistant engineer will meet intending contractors at Bothwell Bridge at 10.20 a.m., on Feb. 4. Tenders must be lodged with the Clerk to the Local Sub-Committee, James Forsyth, the Cross, Bellshill.

Feb. 16—March 8. **BIRMINGHAM.**—Erection of a Council school in Sladefield Road, Washwood Heath, for the Education Committee. Applications for forms of tender and bills of quantities may be made on or before Feb. 16, in the Finance Office at the Education Department, Edmund Street, Birmingham, accompanied by deposit of £2. Drawings may be seen in the Architect's Office at the Education Department. Tenders must be delivered to Jno. Arthur Palmer, Secretary of Education, Education Department, Edmund Street. Fair wages clause.

Feb. 17. **CLEATOR MOOR.**—Contractors willing to tender for the various works required in the erection of a new vicarage at Cleator Moor are requested to send their names, stating trades required, before above date, to J. H. Martindale, F.R.I.B.A., Architect, Eaglesfield Abbey Rooms, Castle Street, Carlisle.

Feb. 18. **MIDDLESBROUGH.**—Builders wishing to tender for the various works required in building new offices, 15, Albert Road, Middlesbrough, for A. H. Sill and Son, are requested to send in their name to Moore and Archibald, architects, 27, Albert Road, Middlesbrough, by above date, when bills of quantities will be supplied.

Feb. 21. **WOKING.**—Erection of a cottage in South Road, Horsell, Woking, for the U.D.C. Tenders are to be delivered to G. J. Wooldridge, Surveyor to the Council, Council Offices, Woking, from whom particulars may be obtained.

Feb. 21. **WATERLOO WITH SEAFORTH.**—Erection of the Rawson Road Council School, Seaforth, near Liverpool, for the U.D.C. Bills of quantities may be obtained from the undersigned upon deposit of £1 1s. Drawings and specifications may be seen at the office of Appleyard and Quiggin, Architects, No. 67, Lord Street, Liverpool. Tenders must be delivered to John I. Thompson, Clerk to the Council, Town Hall, Waterloo, near Liverpool.

Feb. 21. **WELLINGBOROUGH.**—Execution of the following works in connection with a scheme for water supply to the village of Isham, for the R.D.C.:—1, construction of brick water tower, fencing, and other works connected therewith; 2, supply of C.I. mains; 3, supply of valves, hydrants, and other fittings; 4, carting from station and excavation for and laying of mains, etc.; 5, supply, delivery, and fixing of 25,000-gallon C.I. tank and girders to carry same, etc.; 6, duplicate pumping plant, by wind and oil engine. Drawings and specification may be seen at the office of Sharman and Archer, Engineers, Wellingborough, where tenders must be delivered.

Feb. 21—March 5. **NORMANTON.**—Erection of new girls' school at Normanton, for the Governors. Plans and specifications may be seen, and quantities obtained, at the office of Arthur Hartley, architect, County Chambers, Castleford, to whom names must be sent by 21st inst. Tenders to be delivered to W. Norwood, Clerk to the Governors, Snow Hill View, Wakefield.

Feb. 22. **EDINBURGH.**—Raising existing car sheds, roofs, etc., at Henderson Row Cable Power Station for the Corporation. Specification and form of tender may be obtained from J. Walker Smith, Burgh Engineer, on deposit of £2 2s. by crossed cheque payable to Town Clerk. Tenders must be lodged with Thomas Hunter, W.S., Town Clerk, City Chambers, Edinburgh.

Feb. 22. **SHEFFIELD.**—Extensions and alterations of the training college for teachers, Collegiate Crescent, for the Corporation. March 1. **EPSOM.**—Supplying and fixing complete (including all builder's and other work) a self-registering 10-ton weighbridge, of the size of 12ft. by 7ft. in the roadway at the Workhouse, Epsom. Further particulars can be obtained on application to the Master of the Workhouse. Tenders, on forms to be obtained of Alick G. Ebbutt, Clerk, must be delivered at the offices of the Guardians, "Gynsdale," Waterloo Road, Epsom.

March 3. **PENDLETON.**—Structural alterations at the Union Infirmary, Hope, Pendleton, for the Salford Union. Specification and all particulars may be obtained from H. Lord, F.R.I.B.A., 42, Deansgate, Manchester, on deposit of £2. Tenders must be delivered to F. Townson, Clerk to the Guardians, Union Offices, Eccles New Road, Salford.

March 4. **WAKEFIELD.**—Execution of the following works, for the West Riding Education Committee: Saddleworth Uppermill New School (builder, joiner, slater, plasterer, plumber, painter, road maker). Plans may be seen, and specifications with quantities obtained, on application to the Education Architect, County Hall, Wakefield. Deposit of £1 in each case must be sent by separate letter to the West Riding Treasurer, County Hall, Wakefield. Tenders to be sent to Francis Alvey Darwin, Clerk of the County Council, County Hall, Wakefield.

March 5. **DISS.**—Erection of new stables, with fire engine house and harness house, in the Council's yard, in Chapel Street, for the U.D.C. Plans may be seen, and specifications obtained on deposit of 5s. Tenders must be sent to Alfred Cooper, Surveyor, The Terrace, Diss.

March 5. **SALE.**—Erection of a new County high school for girls at Sale, for the Chester C.C. Plans and specifications can be seen at the office of H. Beswick, F.R.I.B.A., County Architect, Newgate Street, Chester, and quantities obtained on deposit of £2. Tenders are to be delivered to W. Egerton Smith, F.C.A., Clerk to the Governors, 46, Brown Street, Manchester.

March 5. **NEW ROSS.**—Sanitation and alteration to Workhouse, comprising:—1, drainage and water supply; 2, erection and completion of sanitary annexes, etc.; 3, plumbing and hot water circulation; 4, erection of a new kitchen and annexe at the fever hospital, for the Union. Plans and specifications may be seen at the Boardroom, New Ross, and at the office of the Architect, J. A. Ryan, 33, Catherine Street, Waterford. Forms of tender are to be obtained from P. A. Pope, Clerk of the Union, New Ross, to whom tenders are to be sent.

No date. **BALLYMENA.**—Erection and completion of proposed parochial house, Ballymena, County Antrim, for Very Rev. T. O'Donnell, P.P., V.F. Plans, specification, and particulars of the work can be obtained at the office of Moore and Flanigan, Architects, 35, Royal Avenue.

No date.—**STON EASTON (near Bath).**—Erection of two or more blocks of cottages at Old Down, Ston Easton, near Bath, for J. Henry Iles. Builders desiring to tender should send their names to William F. Bird, M.S.A., Architect, Midsomer Norton, Somerset., and bills of quantities, with forms of tender, may be obtained on application. Plans and specifications will be deposited at the office, also at the office of the Emborough Stone Co., Ltd., Emborough.

ENGINEERING.

Feb. 22. **LONDON, S.W.**—The Sec. of State for India in Council is prepared to receive tenders to supply woodworking machinery. Conditions of contract may be obtained on application to the Director-General of Stores, India Office, Whitehall, S.W.

Feb. 22. **LONDON.**—Road work and platelaying required for the construction on the underground conduit system of the Council's tramways in Mitcham Lane and Southcroft Road, and in Wimbledon Road, and paving works for street widenings, for the L.C.C. The route is equivalent to about 3.63 miles of single track. The contractor will be required to use the track rails with fastenings, slot rails, and conductor rails, and the special work for the crossovers, etc., which will be provided by the Council under other contracts, but all the remaining metal work and other materials will be included in the contract. Persons desiring to submit tenders may obtain specification, bills of quantities, form of tender, and other particulars on application to the Chief Engineer of the Council, Maurice Fitzmaurice, C.M.G., at the County Hall, Spring Gardens, S.W., upon payment to the cashier of the Council of £5 deposit. Full particulars may be obtained on application at the County Hall before payment of fee. Tenders to be delivered at the County Hall, addressed to the Clerk of the London County Council, Spring Gardens, S.W. Fair wages clause.

Feb. 23. **HOLLINGBOURN.**—Construction of two new culverts at Hawkesbury, in the parish of Headcorn, for the R.D.C. Drawings and specifications can be seen on application at 33, Earl Street, Maidstone. Tenders to be sent to H. J. Breacher, Clerk, 33, Earl Street, Maidstone.

Feb. 28. **WIMBLEDON.**—Supply and execution during the year ending March 31, 1911, of the following materials, works, etc., for the Corporation:—1, engine room stores; 2, cables and earthenware conduits 3, joint boxes and jointing materials; 4, transformers; 5, meters and prepayment meters; 6, oils; 7, incandescent electric lamps and accessories; 8, flame arc carbons; 9, castings; 10, firebricks and fireclay. Forms of specification and tender, with conditions of contract, may be obtained, and samples inspected on application to the Borough Electrical Engineer, Electric Light Works, Durnsford Road, Wimbledon. Tenders to be delivered to A. Steele Sheddon, Town Clerk, Wimbledon.

March 7. **BUCKIE, N.B.**—Construction of an extension of the Buckie (Cluny) Harbour, and the improvement of the existing harbour, for the T.C. The work includes the construction of concrete piers and quays, rock excavation, dredging, etc. Contract drawings, terms, and conditions of contract, specification, and bills of quantities, may be seen on application to the undersigned, or at the office of the Engineer to the Council, W. T. Douglas, 15, Victoria Street, Westminster, S.W. Copies of the form of tender, terms and conditions of contract, specification, and bills of quantities, may be obtained on application to the Engineer upon deposit of £3 3s. Copies of certain of the plans may be obtained from the Engineer on payment of 10s. 6d., which is non-returnable. Tenders to be delivered to John L. M'Naughton, Town Clerk, 4, Cluny Square, Buckie, N.B.

IRON AND STEEL.

Feb. 22. **LONDON.**—Supply of (1) crossings and switches; (2), rails; (3) fishplates, for the Secretary of State for India. Conditions of contract may be obtained on application to the Director-General of Stores, India Office, Whitehall, S.W., to whom tenders are to be delivered.

Feb. 22. **SOUTHALL NORWOOD.**—Supplying and fixing entrance gates and wrought-iron unclimbable fencing, and other appurtenant works at Southall Park, for the U.D.C. Drawings and specification may be seen and forms of tender and all information obtained of Reginald Brown, A.M.Inst.C.E., F.S.I., Engineer and Surveyor to the Council, Public Offices, Southall, Middlesex. Tenders must be delivered to the Clerk of the Council.

Feb. 22. **NEWPORT, ISLE OF WIGHT.**—Supply of (1) 30 yards of 12in. cast-iron spigot and socket pipes and other special castings, delivered at the Town Quay; (2) carting pipes from the Town Quay, Newport, to the waterworks, and excavation for and laying of same from the pumping station to the new main adjoining, at Carisbrooke, and supply of valves, hydrants, etc., for the Corporation. Plan may be seen and specifications and conditions of contract, together with form of tender and drawings of special pipes, obtained on application to T. Ross Pratt, Town Clerk, Town Clerk's Office, 19, Quay Street, Newport, I.W., to whom tenders are to be sent.

Special Annual Issue of "THE ARCHITECTURAL REVIEW."

"Recent English Domestic Architecture," 1909.

PRICE **5/-** NETT.

THROUGHOUT the domain of Architecture, English Domestic Work is of acknowledged supremacy. It is the admiration of all countries, and is one product, at least, in which British Architects hold undisputed pre-eminence. The Domestic Work designed during the past few years by our leading Architects has shown progressive volume and interest, and this continuous development has coincided with and has, no doubt, greatly encouraged a remarkable growth of artistic taste among the laity, as well as in the Architectural Profession.

Month by month, specimens of noteworthy Domestic Work are shown in "THE ARCHITECTURAL REVIEW"; but necessarily only a limited number of examples can be represented through that medium.

The Publishers have much pleasure in announcing that the above Special Issue is now ready. It comprises a collection of choice examples of Recent Domestic Work by Architects who have achieved distinction in this class of design. The examples are not restricted to any particular school or style, intrinsic merit being the only test.

TECHNICAL JOURNALS, Ltd., Caxton House, Westminster.

"Recent English Domestic Architecture," 1909.

Palace Skating Rink, Trafford Park, Manchester, covered with Rexilite Roofing.

PATENT VULCANITE ROOFING

FIRE RESISTING.

The best covering for FLAT ROOFS of wood or concrete construction.

Complies with the London Building Act and Local Regulations.

No expense of maintenance. Guaranteed for long periods.

SPECIFIED BY LEADING ARCHITECTS AND ENGINEERS.

Tested by the British Fire Prevention Committee.

Also Manufacturers of Asphalte and Bitumen Dampcourses and various classes of Sheetings for light Roofs. Samples free.

For Full Particulars, Catalogues, Detailed Sketches, and Estimates, apply to

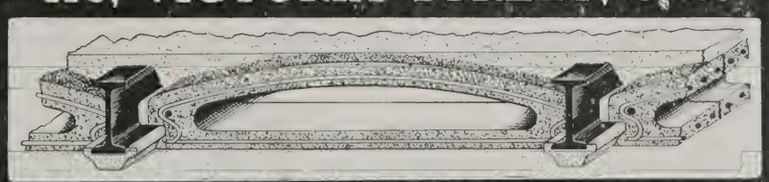
VULCANITE, LIMITED,

London Offices: 118, Cannon Street, London E.C. And at Belfast and Manchester.

From North of England, Scotland, and Ireland, please address to Belfast.

Telephone—Works: 828 NEW CROSS

D. G. SOMERVILLE & COY,



Fire Proofing Specialists,

116, VICTORIA STREET, S.W.

Telephone—Offices: 728 GERRARD.

ADVANTAGES.

No Centreing required.
Can be used same day as laid.
No possibility of a collapse.
Absolutely Sound Resisting.
Level Ceilings with Key for Plaster.
30% Lighter than a Solid Floor.
Can be opened or Trimmed where required.

Section of our Hollow Reinforced Concrete Fire and Sound Resisting Floors and Roofs.

QUOTED FOR COMPLETE WITH STEELWORK AND FILLING, OR REINFORCED CONCRETE BLOCKS SUPPLIED READY FOR FIXING BY BUILDER.

These Floors have been constructed at:—
CHELSEA TOWN HALL.
NORWICH UNION BUILDINGS.

WANTED cheap plates from weekly architectural journals (recent years). — Box 5535, Builders' Journal Office.

Property to be Let or For Sale.

BROXBOURNE, HERTFORDSHIRE.

Exceptionally beautiful Building Estate, in Plots, for Occupation or Investment.

MESSRS. BRIDGMAN and SON, in conjunction with Messrs. Rogers, Chapman, and Thomas, will Sell by Auction, at the New Hall, Broxbourne, on Thursday, March 17th, at Three o'clock, a Portion of the Broxbournebury Estate.

Sixty-six Freehold Building Plots of choice sites, covering in all about 29 acres, commanding extensive and beautiful views; capital frontages, large areas, and good roads; near churches, river, and station half an hour from Liverpool Street and St. Pancras; gas and water; golf course near by.

Particulars, plans, and conditions of Sale can be obtained from W. A. Vincent, Esq., Estate Office, Broxbornebury Messrs. Thorowgood, Taber, and Hardcastle, Solicitors, 11, Copthall Court, London, E.C.; and of the Auctioneers respectively, 78, Gloucester Road, South Kensington, S.W.; and 50, Belgrave Road, Westminster, S.W., and Hoddesdon, Herts.

BY EDWIN FOX, BOUSFIELD, BURNETTS, AND BADDELEY.

AT THE AUCTION MART,

ON WEDNESDAY, MARCH 2nd, at 2 o'clock.

WANDSWORTH.—Freehold Property, with possession, No. 61, High Street, immediately opposite the Town Hall, and near the Wandsworth Station on the L. and S.W. Railway. It comprises an old house with two shops, stabling and workshops in the rear, having a frontage of about 36ft., and covering an area of about 8,050 superficial feet. Let at the low old rent of £69 19s. 11d. per annum on a lease expiring at Lady Day, 1910, when the land will afford a very excellent building site for the erection of modern shops and business premises.

Particulars of the Vendors' Solicitors, Messrs. Murray, Hutchins, Stirling, and Co., 11, Birchin Lane, E.C., and of Messrs. Edwin Fox, Bousfield, Burnetts, and Baddeley, 99, Gresham Street, Bank, E.C.

BY EDWIN FOX, BOUSFIELD, BURNETTS, AND BADDELEY.

(In conjunction with Mr. W. MAURICE-JONES),

AT THE AUCTION MART,

ON WEDNESDAY, MARCH 2nd, at 2 o'clock.

BERMONDSEY. — Excellent Freehold Property, known as Nos. 92 to 100, Long Lane, and 2A, Chapel Place, comprising a block of eight houses with shops, a private house and spacious stabling, the whole having frontages of about 116 and 87ft., and containing an area of 9,760ft.; producing £538 4s. per annum, and affording a safe and profitable investment, either as at present, or by development as a building site, for which its extensive frontage and freedom from dominant lights renders it exceedingly well adapted.

Particulars, with plan, of the Vendors' Solicitors, Messrs. Syrett and Sons, 45, Finsbury Pavement, E.C.; of Mr. W. Maurice-Jones, Estate Agent, 22, High Street, North Finchley; and of Messrs. Edwin Fox, Bousfield, Burnetts, and Baddeley, 99, Gresham Street, Bank, E.C.

Contracts Open.

Status and Maintenance.

Mr. Walter Sickert, who is always exhilarating and illuminative, said, in the course of a lecture st week, that if he had a grievance it as about the relation of the painter to e public in this country. The painters, said, were treated rather as bishops, hile they preferred to be treated as adesmen. What they wanted was not atus, but maintenance. "When people ent to other professional men for advice, ey were told to take things they did not ke, such as Gregory's powder. It was ot so with the artist." Surely this is to mpare unlike conditions. The artist, hether painter or architect, does not wish have status and maintenance set before im as mutually exclusive alternatives. e wants them both; and, unless he is a ad artist, he finds them inseparable. Nor he, as a rule, desirous of forcing his leas upon an unwilling patient as if they ere physic. Of course there are exceptons. Of the late Mr. Bodley, for instance, is refreshing to read, on the authority of Ir. Edward Warren, that he "was not only master of his art, but excessively masterul. He permitted nothing and nobody to terfere with his intentions. In the carrying out of a design he had set his heart n, he was obstinate and obdurate, and he ways ended by getting his own way in e long run—and the run was sometimes matter of years." But then he had the atus and the maintenance, both barrels aded.

"Serious Defects."

A long time must elapse before it will have been possible for the Housing and Town Planning Act be thoroughly examined from every oint of view. Mr. R. E. Havard Villiams, in a paper read at the Auctioneers' Institute, called attention to ertain portions of the Act which he regarded as serious defects It does not epeat previous Acts *in toto*, but merely mends them, and thus gives rise to difficulties with regard to its interpretation. e therefore wants a consolidation Act. a year or two this request will have atured into something like reasonableess. Human foresight is not so keen that e can afford to dispense with actual experience of the working of the Act. A onsolidating Act based upon mere theory ould make confusion worse confounded. hen Mr. Williams thinks that "the proters of the Act might have devoted their legislative energy to giving, among other things, facilities for dealing with undesirable tenants. An occupant should be made to keep his premises in a clean and sanitary condition." He also thought that it should provide for the supply of ejectment orders in respect of tenants at rentals up to £40 a year in London. It is well that we should see the Act as others see it; but sympathy with the specialist's attitude is always subject to a considerable discount. That being understood, it would be unwise to discourage such contributions to the general understanding of the Act, however extravagant and extreme they may appear to those who are tolerably free from the exuberance of perfervid professionalism. The Act is sufficiently complicated already, and it is to be devoutly trusted that revision will make for simplification; and that, in particular, it may not be rendered unutterably odious by associating it with writs of ejectment or other inquisitorial engines of torture. Its success depends on its popularity; its popularity, on its being blandly ameliorative.

Plutarchitecture.

Of late there has been a strongly marked tendency on the part of lecturers on architectural subjects to resort to biography. The method has many advantages, the chief of which are, perhaps, the actuality, and the consequent concentration of interest, to which this form lends itself with peculiar facility. Whether or not, in any particular case, we care more for the man than for his works, or vice-versa, is a minor matter, seeing that in any case the very natural association of the one with the other tends to heighten the interest in both, the work glorifying the man, the man humanising the work and giving it an interest and a unity with which it is not always easy to invest examples of miscellaneous authorship, or principles of art and practice abstracted or disconnected more arbitrarily from a wider field of investigation and inquiry. Perhaps, on the whole, it is not a more sound nor a more scientific method than that now generally discredited and discarded habit of making the history of England a series of short biographies of its rulers; yet there can be no doubt of its attractiveness, and that is a quality which, in these days of very necessary pioneer and foundation work in architectural education, it were folly to despise. In all processes of education, "stimulus" is essential to receptivity and assimilation; and lecturers on architecture are fortunate in having at command fairly abundant materials with respect to the more recent men and their work. Where, as in the case of the admirable account of the late Mr. Bodley given before the R.I.B.A. on St. Valentine's Day, the biographer happens to have been closely associated with the life commemorated, there is perhaps some slight aberration of the perspective, for which, however, we get ample compensation in the nearer view and the clearer light; and where, as in Mr. Reginald Blomfield's lecture at the Royal Academy on the life and work of Philibert de l'Orme, the subject is more remote in time and place, the loss of the intimate personal element is usually set off by a considerable gain in the coldly judicial impartiality of the criticism. Each condition has the defects of its qualities, and in either there is more or less of inspiration and delight.

Rome's Zone.

A difficulty and danger of town planning is strongly emphasized in the case of the Zona Monumentale dispute which is now raging at Rome. A federation for the preservation of Italian monuments and artistic treasures is strongly opposing the corporation project of constructing a wide avenue straight across the historic region of Rome, which extends from the Porta Capena to the Porte S. Sebastiano and Latina. The formation of this avenue would inevitably destroy several ancient monuments. It is complained that the commission entrusted with this work does not include a single archæologist or artist; and it is obvious that the commissioners have no sympathy and but little patience with the attitude of the Supreme Council of Antiquities, to whose protest a haughty and dictatorial reply has been returned. The Government has been asked to intervene, and the upshot of the controversy will be awaited with keen interest in this country, where, before long, we may find ourselves in the throes of somewhat similar conflicts between the old spirit and the new. If ever the zone craze reaches London, and is there put into operation, probably the work can be done without demolishing anything more precious than cheap suburban villas, and most of our great cities are in similar case. It is in the formation of straight and wide streets that venerable

obstructions are likely to be encountered, and we may be very sure that proposed operations under the Town Planning Act will not escape the very delicate attention of our societies for the preservation of ancient buildings. Paris, as M. Benoit-Lévy reminds us in an admirable article in the current issue of the "Architectural Review," is fortunate in having its proposed zone occupied by fortifications, of which the futility was demonstrated in the last unhappy war, so that they are likely to disappear without serious protest. Most Parisians, we should suppose, will be glad to see the last of these sinister memorials of "old, unhappy far-off things and battles long ago."

A Street Problem.

An improvement that is being carried out at the junction of Cornhill with Bishopsgate Street, at a cost of nearly £10,000, consists in the demolition of certain property in order to set back the line of frontage, increase the width of the road, and round off a sharp corner. This last item in the programme brings to mind a rather vexed question in street planning. The "sharp corner" is bad for vehicles, but safer for pedestrians; while, on the other hand, the curve that is most suitable for vehicles is apt to be very dangerous to those who go afoot. The curve that is easy for the wheeled traffic brings it with fatal facility on to the person who is about to cross the road. Therefore, the "improvement" at Cornhill is a strong argument for the formation of another subway. The crossing there is already highly dangerous, and will become still more so in the measure to which it facilitates wheeled traffic to the inconvenience of the foot-passenger.

Measured Drawings and Details.

With the steady growth of scholarship which is one of the most encouraging portents for British architecture, there is an increasing demand for the means of study. The architect of to-day is keenly anxious to examine and to analyse good work, whether it be that of his contemporaries or of earlier date. In this direction much may be achieved, in these days of facile transit, by visits to actual buildings, and this is an exercise which the neophyte cannot afford to neglect. Those, however, who have got beyond this stage, and are no longer, in the strict sense of the phrase, *in statu pupillari*, require a shorter method. They have no imperative need to measure and draw actual buildings, because their experience in this kind has furnished them with power to extract all the information they require from the measured drawings that are now being published in sufficient abundance to furnish them with an ample and a varied supply of examples that are worthy of analysis; and, in a modified degree, the same remark applies to the student proper, who, indeed, is bound to supplement his own original efforts by recourse to the labours of others in the same field. The proprietors of this Journal were quick to recognise and prompt to supply this need, and in the "Architectural Review" a special feature has been made of "The Practical Exemplar of Architecture," in which, every month, there has been maintained a constant supply of measured drawings of noteworthy work old and new, and this feature has been recently augmented and strengthened by the incorporation of the publication known as "Details." This periodical, it is hardly necessary to explain, was an entirely independent venture, in which the present proprietors were in no way interested. Having acquired it by purchase, they decided to discontinue it as a separate publication, and to incorporate it with the "Architectural Review" as an augmentation of "The Practical Exemplar." We have evidence that "Details" was highly appreciated; and subscribers to it will be glad to know that it is now embodied in "The Architectural Review," in which they will find not only the features which they valued in "Details," but, in addition, the high-class contributions and fine illustrations which have secured for the "Architectural Review" the position it has so long held as the most eminent of architectural periodicals. The publishers desire us to state that they have taken over all the bound stock and back numbers of "Details" for which application should be made to "Technical Journals, Ltd.," Caxton House, Westminster.

Tenders Under Seal.

We are informed that recently the War Office invited tenders for building works in the provinces, and stated, as one of the conditions of tendering, that the priced quantities must be sent in, under seal in separate covers, along with the tenders, and that only those quantities relating to the lowest tender would be opened. On the faith of this the priced quantities were sent in, but in the case of one at least of the competitors, whose tender was not the lowest and not accepted, it was evident when the quantities were returned that they had been opened and examined, and even pencil corrections made on them. It would seem that there is laxity in the War Office that should not be allowed to continue. Builders rightly object very strongly to sending in priced quantities, even under seal, and the least that those who insist upon having them can do is to see that they are not opened in contravention of the conditions under which they were obtained. Unless this is done, builders will have no alternative but to refuse entirely to send priced quantities along with tenders, as many do even now. It is hard to understand why the War Office, or any other public authority, continues to require priced quantities to accompany tenders when the leading architects in London and the provinces find such a proceeding unnecessary, and never resort to it

Fulwood's Rents, the little Holborn court leading into Gray's Inn Gardens, which will be largely rebuilt, is so named from the Fulwood family. It formerly possessed the privilege of "sanctuary," and hence became a notorious resort for fraudulent debtors, and still more unpleasant characters. Francis Bacon lived here in "Fulwood's House," and valued his furniture at £60, a huge price for that period. Here the Whig Club, and Melbourne and Oates's Club, met in the reign of Charles II., and here stood Squire's coffee-house, from which several numbers of the "Spectator" were dated.

* * *

With their oaken timbers surviving the great fire of London and the ravages of time for more than 250 years, three of the quaintest old houses in London, which stand in Fetter Lane, have just come into the hands of the housebreaker. Originally these three old gabled buildings—Nos. 85, 86, and 87—were part of Barnard's Inn, which was founded in the fifteenth century. Their panelling and stair-rails date from the days of Queen Anne. Generations of lawyers have used the large, low-ceilinged rooms, with their queer capacious cupboards. Faintly, under the paint on the doors, the names of some of them could still be seen.

THE LIFE AND WORK OF G. F. BODLEY.*

By Edward Warren, F.S.A.

Mr. Warren, a former pupil of Mr. Bodley, divided his review into three periods, the initial period covering early training and individual work; the middle or collaborative period; and the final period of reversion to single practice.

Initial Period.

Mr. G. F. Bodley, son of Dr. Bodley, a descendent of Sir Thomas Bodley, of Oxonion fame, was born at Hull in 1827. While a boy his father moved to Brighton and he there first met Sir Gilbert Scott, his future principal. He served five years with Scott, and found his studies and surroundings rather dreary. His enthusiasm for Gothic revived with employment on drawings for Gothic buildings. Work came to him quickly at the expiry of his apprenticeship, his first commission being to add an aisle to a church at Bussage in Gloucestershire for Thomas, brother of John Keble.

His training had been in the rigid convention of English Gothic; formalised versions of English 13th and 14th century styles. His first complete church—St. Michael's, Brighton—shows a revolt, and suggests early French character. Has been spoilt through the addition, by another hand of a large incongruous nave and aisle. The church strikes a note of suave severity, which characterises all subsequent work. Bodley was in close alliance and personal friendship with William Morris, Edward Burne-Jones, Ford Madox Brown, and Dante Gabriel Rosetti in the early Pre-Raphaelite days, and gave them opportunities for work on his buildings. William Morris carried out some stained glass at King's Stanley, Gloucestershire, as well as the western windows at St. Michael's, Brighton, and Burne-Jones was employed on a painted reredos at the latter church. At St. Martin's, Scarborough, Morris carried out the stained glass; Rosetti, Burne-Jones, and Madox Brown painting the pulpit and reredos. Bodley also started C. E. Kempe in stained glass; he also designed one or two of Morris's early wall papers, and assisted and advised in designs for glass, tiles, and church fittings Of this period, St. Martin's, Scarborough, is one of the most interesting buildings. It shows a decided leaning towards severe 13th century Gothic, still with a flavour of France. The elaborately carved and moulded rood and screen were added later by Bodley. He also built the parsonage of the church, and a second church, All Saints, in the same town.

For the first few years Mr. Bodley's small but steadily maintained practice seems to present almost ideal conditions for a young architect of quiet and reserved but strong character, of high courage and of great patience, absorbed by the love and the study of his art, free from professional ambitions, and happily saved, by the possession of modest private means, from the anxieties and compulsions of money-earning. He lived during this early period with his mother, in Harley Street, where he worked single-handed, or with occasional assistance only, for several years. Commission followed commission at comfortable intervals, without rush or hurry, and though requiring, as he frequently told me, very strenuous days and laborious nights at times, leaving upon the whole ample time for thought, for music—to which he was always passionately devoted—for reading, for the enjoyment of the society of his friends, amongst whom were conspicuous the various members of the Pre-Raphaelite Brotherhood; for delightful journeys of study, in France, Italy, and Germany, as well as in England, and for occasional indulgence in the pastimes he preferred. Of fine physique and strong and athletic figure, he was a great walker, a keen fisherman, and, as I

*Summary of a paper read before the Royal Institute of British Architects, Monday, Feb. 14th, 1910.

have been told by contemporaries, a very competent cricketer. He detested competitions, which were essentially opposed to his quiet reflective nature and abstract idealism; for, from beginning to end, before and beyond all things, he was an idealist."

The Middle or Collaborative Period.

As work increased he began to find the need of skilled assistance, and turned to his friend, Thomas Garner, who had followed him as a pupil in Scott's office, and who was developing a small practice in Warwickshire. Mr. Garner, at first, worked for him as an occasional assistant; but he was an assistant quite outside any ordinary sense, and his co-operation, though for some time without partnership, grew steadily closer and more important.

At this time a marked change had been taking place in Mr. Bodley's handling of Gothic. The French feeling waned, and the type became more determinately national. His future partner was pronouncedly English; the church of St. Salvador's, Dundee, seems to mark a middle point in this conversion. Austere in form, but with a tempered austerity, there is a fine and graceful severity about its sharply pointed nave arches, which die on to capless piers, and the accentuation of the bays by the slim wall shafts which run up to carry the roof principals; a gorgeous reredos, a gilded wrought-iron screen, and diapered wall-painting were added later.

Mr. Bodley was married about this time to Minna Frances, the daughter of Mr. George Reavely, of Kinnersley Castle, Herefordshire. He left one son, Mr. Hamilton Bodley.

In co-operation with Mr. Garner and before actual partnership, Mr. Bodley built All Saints Church, opposite the great gate of Jesus College, Cambridge. The interior is elaborately decorated in colour, but the glass by Morris, is not very successful.

A dangerous and unfortunate attack of blood-poisoning followed, apparently, after an inspection of some fetid burial vaults under a church at Louth. Unhappily it kept Mr. Bodley in bed many months, turned his hair white and crippled him for life. The effects of this illness subjected him to recurrent periods of disablement and pain, and his lameness made his constant journeys and supervision of buildings onerous and difficult. The illness led him to seek a closer co-operation with Mr. Garner, and a formal partnership was entered into in 1869.

Among the early works of the partners are: The Church of St. John, Tue Brook, Liverpool, the Church of the Holy Angels, Hoar Cross, Staffordshire (built by Mrs. Meynell Ingram as a memorial to her husband), and St. Augustine's, Pendlebury. The church at Hoar Cross is quite a small village church, but probably is the building which most completely represents the ideals of the partners. At this church a memorial to Mr. Bodley has recently been added in the shape of a narthex, from the designs of Mr. Cecil G. Hare, Mr. Bodley's second partner.

Then follows the London Education Committee's offices on the Thames Embankment, which was begun in 1873. It has since been added to by another hand. Mr. Garner was mainly responsible for the original elevation. Another riverside building is River House, at the corner of Tite Street, Chelsea.

Of work at Oxford and Cambridge may be mentioned the addition to the Library at Christ Church, Oxford, and the Great Tower at the south-east corner of the Tom Quad; the Master's Lodge, University College, built between the years 1876 and 1879; additions to Magdalen College, known as St. Swithin's Quadrangle, begun in 1880. In the Oxford work Mr. Garner bore the lion's share (except for the Church of St. John the Evangelist at Cowley, Oxford). At Cambridge the work is mainly Mr. Bodley's. Here, new and distinct buildings were added to King's and Queen's Colleges; at the first-named an incomplete quadrangle, known as Bodley's buildings; at the latter the red-brick chapel. Bodley's buildings properly come in the last period. Of the churches of this time, may be mentioned the Cathedral at Hobart, Tasmania; St. Michael, Camden Town (1880), the Church of St. Germain, Cardiff, and St. Saviour's, Cardiff.

The next building, the Church of St. Mary the Virgin, Clumber, Notts, built for the Duke of Newcastle in 1886, marks a point of departure, a cessation of active collaboration between the partners. From this time, until the actual cessation of the partnership in 1898, each partner worked singly upon a given design.

Even before this date there were several works, which though bearing the names of both partners were really the absolute work of one of them. The reredos in St. Paul's Cathedral, for instance, was entirely Mr. Garner's design.

The Final Period.

Taking Clumber Church as the beginning of the last period, the ten years from 1885 to 1895 saw as many new churches begun and completed by Mr. Bodley. Eckenswell, Horbury, Skelmanthorpe, Warrington and Danehill Church in Sussex are all small buildings; Epping, Hackney Wick, Norwood, Branksome, Bournemouth and Cowley, are all town or suburban churches of some size. The last-named is a monastic church, built for the Cowley fraternity. Mr. Bodley's skill in adaptations and alterations may be seen in the English Church at Florence (formerly a secular hall), the church at Hickleton and the conversions of the modern churches of St. Paul's, Knightsbridge and St. Giles, Wimborne. The last was unfortunately burnt down recently.

Later works are St. Mary's, Eccleston, built for the Duke of Westminster, Holbeck Church, near Leeds, All Souls, Leicester, and the Wayside Chapel at Woodlands, Dorset, all in the later manner. The last building of any considerable size was the Church of Holy Trinity, Kensington, built on a somewhat cramped site. The extreme slimness, the attenuation of detail in this church are extremely symptomatic of his final manner, and a critical mind will find this quality carried to excess in much of his late work.

Great honours and great opportunities came to him very late in life. One of the greatest opportunities, indeed, the more is the pity, close at the end. In 1906, the year before that of his death, came the remarkable evidence of American appreciation in the commission to design the cathedral for Washington, in conjunction with his old friend and former assistant Henry Vaughan of Boston. This was quickly followed by the placing of another American cathedral, that of San Francisco, in his hands. In the autumn of 1906 he journeyed out with Mr. Cecil Hare, his friend, assistant, and ultimately his partner, to the United States to inspect the sites of the two great churches, and to make preliminary arrangements. Upon his return to England, and while employed upon yet another remote cathedral—in India—he at once began the designs for Washington and San Francisco. He was much hampered by ill-health in the spring of the following year, but managed nevertheless to complete his designs, working to a great extent in the beautiful old stone manor house of Water Eaton, near Oxford, which he had taken in 1906, and where he was to end his days. He was destined never to witness even the actual beginning of the American buildings, but left the drawings in a well advanced stage of preparation. The United States had done him previous honour by bestowing upon him in the year the gold medal of the American Institute. A similar honour was done him in 1899 by the R.I.B.A., for in that year he received from the hands of the president, in this room, the Royal Gold Medal. He was elected Associate of the Royal Academy in 1882, and full Academician in 1902. In the summer of 1907 he received from the University of Oxford an honour which he greatly valued, that of the honorary degree of Doctor of Civil Law. He died suddenly and peacefully on the evening of Sunday, the 21st October, in the old house that he had grown to love. Among his pupils, beside Mr. Warren and Mr. Vaughan, may be mentioned Professor F. M. Simpson, the late A. H. Skipworth, Mr. J. N. Comper, Mr. F. Inigo Thomas, and Mr. R. S. Lorimer, A.R.S.A., of Edinburgh. Mr. Walter J. Tapper was one of his head assistants.

Personality.

No just estimate of his character or attainments could be formed without intimate acquaintance, and he was not easy to know. Retiring and indeed somewhat shy, self-contained and introspective, his external manner, albeit invariably courteous to all alike, was frequently somewhat aloof and apt to impress strangers as reserved and rather cold. He did not as a rule make friends

THE BURKITT HOMES, KING'S LYNN: THE BOARDROOM. HERBERT T. TILSON, ARCHITECT.

The room has door, chimney piece, and dado in oak, enriched with cinquefoil tracery. The ceiling is carried by oak beams, and the floor is laid with oak parquet.

easily or quickly, but once made, he retained them, and their number was not a few. To his pupils and assistants, and he had many during the latter half of his life, he was delightfully friendly, and inspired admiration and respect in all, and in those who knew him best the warmest affection. To his intimates, to those with whom he was in real sympathy, he was delightfully open and indeed expansive at moments, full of kindly humour and fun, a charming host, extending charming hospitality to his guests, loving a good story, a good rubber of whist, and a good cigar; loving above all, music and song. He was an ardent musician, and an accomplished pianist, playing with intense delicacy and feeling the old melodies he preferred, or occasionally his own compositions. Music he placed above all arts, and used sometimes to say that he wished he could have devoted his life to it. His love of colour and his fine instinct for its employment and distribution, were almost phenomenal. In his own home, or homes, for I have known him in many houses, he was always surrounded by fine hangings, stately old furniture, old tapestries, pictures, rare old china, mostly blue and white oriental, silver, and glass. He was fastidious in such things, and could understand no comfort without comfort for the eyes. He loved his house and perhaps still more his garden. A certain stateliness of surroundings was ever part of his natural appanage, and seemed becoming to his stately personality, his handsome face, lofty forehead and large dark eyes, grave in repose, but lighting up in greeting to a friend, or twinkling with fun at a joke.

He expressed himself admirably in writing tersely, humorously and amusingly in his friendly letters; his actual handwriting was picturesque and characteristic rather than legible. He wrote with great facility, but did not like the task of writing. Ready, expressive and apt in conversation, and frequently witty, he was a diffident speaker in public, and shrank from all public speaking. He filled, however, the office of Prime Warden of the Fishmongers' Company, presiding with graceful dignity at many feasts. Functions and public ceremonies he hated, and always carefully avoided all "inaugurations" and foundation-stone layings. His conspicuous professional success owed nothing to business habits; it was won in spite of their default, for a worse man of business in the usual sense it would be impossible

The woodwork is all in oak, the floor is laid with oak parquet, and the light fitting is of wrought-iron.

to find. He detested accounts and kept none; he detested business letters, and frequently delayed answers to important communications—when he answered at all—for weeks or months. If a client became bothersome, he got no answers to any written communication; if he called in a rage, he was received with unruffled courtesy, and generally bowed out smiling and happy in a quarter of an hour. Mr. Bodley was not only a master of his art, but excessively masterful; he permitted nothing, nor nobody to interfere with his intentions. In the carrying out of a design he had set his heart on he was obstinate, nay obdurate, and he always ended by getting his own way in the long run—and the run was sometimes a matter of years. He has been called a copyist. Nothing could be farther from the truth. Except occasionally in minor details, he never copied. He possessed remarkably few architectural books; his professional library, indeed, would have been modest for a beginner. In his youth, even during his pupilage, he had sketched but little, in spite of constant urging; in his later years not at all. His method of studying an old building was, as regards the exterior, to borrow a chair, which he carried from point to point of view, during the contemplative smoking of a cigar; when the cigar was out, he went inside, and, minus the tobacco, continued the contemplation. Yet he would remember the building, even to its details, for the rest of his life. He would never make any written note of an engagement, but I never heard of his forgetting one. I have heard it confidently stated that he could not draw—a most absurd statement. He regarded drawing for an architect as solely a means to a definite end—the realisation of his design; and to that end his drawing was always adequate. For neat and finished drawings he had small regard, and no patience in his later years for their preparation; but his planning was quick and accurate, and his sureness and rapid facility in detail-drawing were astonishing. His little explanatory sketches, rough though they were, were always vividly graphic. His first notes of his various conceptions for a plan, or some large detail, were made anyhow and anywhere—in bed, in the train, in an hotel, at his club, or in his garden, and on anything handy—the back of a letter, an advertisement card, or the margin of a newspaper. He sketched in his cheque book, and is known to have filled his bank pass-book with notes and sketches. He had an extraordinarily fine sense for curves, and hated a weak or a flabby one. "Keep them nervous," he told one. His injunctions to his staff were always in the direction of refinement and restraint. "Learn to leave out. A young architect's india-rubber is more important than his pencil," he once said to me; and again, of window tracery, "It's not the shapes you make, but the shapes you leave, that matter." Of drawing generally, as applied to architecture, he used to say that we all draw too much; and that with one vernacular style, and workmen who understood it, hardly any drawing would be necessary.

He was extremely ingenious and resourceful, but disliked obvious ingenuity in design, and indeed avoided it; his work, whatever else may be thought of it, has ever the effortless, inevitable look of quiet surety. His aim was never to startle, he never "played to the gallery," or tried to outrival others. In placing a building in a street, or in contiguity to others, he was always careful to do no hurt to its environment. "You must consider your neighbours," he said, "you've got to be a gentleman in your art."

Discussion.

Mr. G. H. Fellowes-Prynne, in proposing a vote of thanks to Mr. Warren, said his paper was obviously the sincere appreciation of a loyal and devoted pupil. The care with which Bodley had treated restoration work marked him as a man who cherished his art with sincerity. Bodley had followed the tradition of mediæval work, but, as they could see, with no slavish hand. He spent immense care on details, wall paper, etc., and was adept in the use of quiet, refined colour. Hoar Cross illustrated this admirably, and Christ Church, Ealing, was another good example. To-day, the want of colour was everywhere apparent; but it was difficult to educate the popular mind to the need. Bodley was fortunate in having private means, otherwise he would not have been able to deal with clients in so careless a style. Mr. Prynne then voiced his satisfaction that York Minster had been placed in the able hands of Mr. Walter Tapper, a former pupil of Mr. Bodley. Bodley, he continued, was an ardent churchman, as were Pugin, Butterfield, and Street; and this great underlying principle had unquestionably been an inspiration in the conception of noble church architecture.

ST. MARY'S CHURCH, ECCLESTON: INTERIOR LOOKING WEST. THE LATE G. F. BODLEY, R.A., ARCHITECT.

This building Mr. Warren refers to in his paper (see page 140) as characteristic of Mr Bodley's later manner. The building, erected in Red Runcorn stone, is less inspired than the churches at Pendlebury, Hoar Cross, or Clumber.

Mr. Walter J. Tapper, in seconding the vote, said he was much impressed by the dominant note of love and reverence that pervaded Mr. Warren's paper. There was a prevalent feeling that Bodley could not draw, and was not an expert draughtsman. He, perhaps, could not draw in the modern sense, as, for instance, in the execution of elaborate water colours; but it was quite untrue to say he could not draw. Bodley was a very rapid worker, in illustration of which Mr. Tapper mentioned how he (Mr. Bodley) would commence work on Saturday afternoon when his assistants had left, and would surprise them by having ready on the following Monday morning a complete design for a church, replete with detail drawings. By his method of working it was quite obvious that he was a great creative genius.

Mr. Longden and Mr. Maurice B. Adams having joined in the discussion, Mr. Warren made a brief reply.

Correspondence.

[The Editor declines responsibility for the statements made or opinions expressed by correspondents.]

The Guild of Architects' Assistants.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I should be greatly obliged if you would allow me space to correct an impression concerning the above Guild which appears to have some currency. The Guild does not propose to place any section of the profession in opposition to any other, or to oppose any of the existing architectural societies in their work, and for that reason its subscription is placed at a very low figure. Its main object is to fill up a gap which undoubtedly exists, by the formation of an assistants' society. It desires to bring together architects' assistants and interested principals for the purpose of mutual aid, social intercourse, and the discussion of the various professional difficulties which beset the assistant. Principals have continually been invited to join and assist in developing the programme we have formulated, and some well-known architects in practice have heartily supported our proposals.

The Guild has no desire to run into absurdities or to decry the proud position of architecture as Mother of the Arts; but the work it desires to accomplish is the work that is really necessary, the task of the improvement of the assistants' position, educationally and professionally; to encourage and maintain that enthusiasm for architecture so necessary for the development of ability; to endeavour to introduce some order into the present chaotic condition of the assistants' relationship to the profession, the result of which cannot fail to be of benefit to all.

ERNEST J. DIXON, A.R.I.B.A.,
Hon. Secretary.
137, Church Street, Edgware Road, W.

Obituary.

The death is announced of Mr. James Armitage, builder and contractor, of Southwick, Sunderland. Mr. Armitage, who commenced business for himself at Hartlepool in 1849, was responsible for a large number of buildings in the town and district. He erected Park Lands, Castle Eden, a mansion built for the widow of the late Mr. Rowland Burdon; the offices of Messrs. Doxford and Sons, the business premises of Messrs. Grimshaw and Sons, High Street West; Messrs. Clark and Sons, Engine Works, Southwick; and a large number of churches, chapels, schools, the police buildings at Southwick, and the Fulwell Council Schools, while other schools are in course of erection at Wingate, Seaham and Horden. Mr. Armitage was for many years a member of the Southwick District Council, and one of the first members of the School Board, of which he was vice-chairman for 12 years. Mr. Armitage, who was 83 years of age, leaves a widow and a family of one son and three daughters.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Mar. 1.	GLAZED BRICKWORK DESIGNS AND ESSAYS. A committee of glazed brick manufacturers invite designs for works to be executed in glazed brickwork, also essays as to the advantages to be derived from the use of this material in accordance with conditions to be obtained from J. Johnston Green, 142, Liverpool Road South, Southport. Premiums of 100 guineas, 50 guineas, and 25 guineas awarded to designs and essays jointly. Assessor, Mr. Max Clarke, F.R.I.B.A., appointed by the President R.I.B.A.
Mar 31.	SHEFFIELD ENDCLIFFE PARK CHURCH. Plans desired for Church for 650, Institute for 150, Primary Department for 125, Junior Department for 95, and Caretaker's Apartments. Premium, not merged in commission, £35. Assessor, Chas. Hadfield, Esq., F.R.I.B.A., Delivery on March 31. On receipt of 5s. the Secretary, J. W. Nicholls, 64, Everton Road, Brocco Bank, Sheffield, will furnish conditions and instructions with plan of site, showing existing buildings, levels, and drainage—these not returnable. Deposit returned only to those who send plans.
Mar 31	MUNICIPAL OFFICES, KARACHI. The Municipality offer a premium of 7,500 rupees (£500) for the best design, detailed plans and estimates for new Municipal Offices. Cost not to exceed 500,000 rupees, and the style of architecture is left open to the designers. Ferrotype plans of the site and a general arrangement of the floors of the building showing the accommodation to be provided, together with a copy of instructions to architects, will be supplied to intending competitors on application to the Chief Officer and Chief Engineer, Karachi Municipality. A charge of Rs. 5 will be made therefor, which will not be refunded. Each set of drawings must be sent in anonymously, but accompanied by a sealed envelope containing the author's name and address. Each set of drawings and all the documents required, including the sealed envelope, must be securely packed in a wooden box, addressed as follows:—The Chief Officer and Chief Engineer, Karachi Municipality, Karachi, India, and forwarded, at the competitor's own risk and charges, in time to reach the Chief Officer on or before the 31st day of May, 1910. It is proposed to apply to Government for permission for one of the chief architects to act as assessor to decide on the design to which the prize shall be awarded. The final decision of the assessor will be final and not open to dispute. The decision of the Municipality will be made within three months of the latest date for submission of designs, and payment of one-half of the premium will be made thereafter to the author of the selected design, the balance to be paid when the further details specified in the instructions to architects have been supplied. On payment of the premium the Municipality will have all rights in the design, with power to erect the building under its own agency, either according to the design selected or with such additions or alterations as it may deem necessary.
No Date	SECONDARY SCHOOL AT PETERBOROUGH, for Soke of Peterborough Education Authority, to accommodate 250 scholars, but allowing for enlargement so as to accommodate 300 scholars. Particulars of the general instructions and conditions, together with a plan of the site, may be obtained on application to Walter J. Deacon, Clerk to the Authority, Cross Street, Peterborough.

Oldham Town Hall Extension Competition.

The Oldham Corporation has appointed Mr. G. H. Willoughby, F.R.I.B.A., of Manchester, as the assessor in the above competition. The estimated cost of the extension is £25,000.

Johannesburg Town Hall.

The Town Council has adopted the report of the assessor, Mr. Leonard Stokes, F.R.I.B.A., which awarded the premiums as follows:—1st (£500), Messrs. Hawke and McKinley, Cape Town; 2nd (£300), Mr. W. H. Stucke, Johannesburg; 3nd (£150), Mr. D. Hoets, Pretoria; 4th (£100), Mr. P. Treeby, Johannesburg; 5th (£100), Mr. F. G. McIntosh, Pretoria. The stipulated cost is £120,000, for which sum the assessor states that the design placed first can be carried out.

Concrete and Steel Notes.

At a meeting of the Newport (Isle of Wight) Town Council, the question of affixing the seal of the Council to an additional by-law dealing with the walls of a public building or warehouse constructed with steel or iron framework came up for discussion. Mr. Salter took exception to the incomplete way in which the by-laws were drawn up and quoted a report of a fatality arising from the collapse of a steel frame and concrete building at Brussels. He said the by-law stated that the framework should be of sufficient strength to secure due stability, but the strength was not laid down as in all by-laws dealing with brickwork buildings. This was a kind of building much used in America, but he thought they in the old country wanted something more substantial. Buildings of that description were death traps. Mr. J. C. Millgate spoke in support of the adoption of the by-law, saying that the reinforced concrete buildings were the coming style of building for warehouses, etc., and the hundreds which had been successfully erected throughout the country demolished Mr. Salter's argument as to their instability. They must move with the times and their old town should be up to date. Mr. Hinds said it was much better to have by-laws to govern the erection of buildings of that kind than to have those buildings erected without any inspection or restriction whatever as to quality. (Hear, hear.) The proposition was carried, Mr. Salter only voting against it.

THICKNESS OF CHURCH WALLS.

A Coventry correspondent has recently enquired if there is any special thickness of wall required in the design and construction of new churches, when materials are to be of brickwork, with stone dressings, other than the requirements of usual building by-laws.

Should any grant be desired from the incorporated Church Building Society, the construction must be according to their published requirements and suggestions; those relating to walls being as follows:—"Walls must be of not less than the following thicknesses:—

—	Squared Stone of the best quality, or Brick.	Brick or Concrete faced with Flint or Stone.
If less than 20′ 0″ high and carrying a roof not exceeding 20′ 0″ span	1′ 10½″	2′ 3″
If 20′ 0″ high and under 30′ 0″ or carrying a roof exceeding 20′ 0″ span	2′ 3″	2′ 6″
If more than 30′ 0″ high ..	2′ 7½″	3′ 0″

The arcade walls to be measured from the floor line and the gable walls from the ground to half way up the roof. The thickness to be measured on bed and clear of plaster. These dimensions are given on the supposition that the walls are solid and sufficiently buttressed. If buttresses are not used, or the walls are made hollow, the thickness must be increased as much as in the judgment of the committee of architects, is in each case required. Iron ties must not be used in hollow walls. The walling round chimney flues must be nowhere less than 9ins. thick." These rules represent a reasonable minimum requirement, and somewhat similar regulations are made by other bodies with funds at their disposal for a like purpose. A copy of the suggestions should be obtained from 7, Dean's Yard, S.W., as other points of design and construction are also dealt with.

ALFRED STEVENS.

Before the Aberdeen Architectural Association, Mr. Henry F. David, Gray's School of Art, read a paper on "Alfred Stevens: His Life and Work," and said that the history of European art since the sixteenth century showed few men exhibiting the versatility which was common during the period of the Renaissance in Italy. For an artist to exercise his talents with ease and distinction in the various departments of architecture, painting, and sculpture was something with which they were not familiar, and yet among the Italians at the time of the Renaissance that diversity of talent was characteristic. They looked back on that epoch, and contemplated with wonder, even with awe, its wealth of talent, and of many-sided genius. In versatility they did not greatly believe. They leaned to it a little in theory, because it had the sanction of remote times, but they were neither anxious to encourage it nor disposed to see it flourish. Yet in that country during last century they were enabled to realise to some degree that all-round power of the great masters in the life and work of Alfred Stevens. That great artist died thirty-three years ago, yet his work was scarcely known to the general public and not even among artists and craftsmen, to whom Stevens should specially appeal, was it familiar. A few knew him as the designer of the great memorial of our military hero in St. Paul's Cathedral, and there all knowledge of Stevens too often ended. The lecturer then briefly outlined Stevens' training, which he said had the intention to equip him fully on all sides to carry on the Latin tradition of Art—that great conception of Michael Angelo's motto, "I know of but one Art,"—and like the great Florentine, his powers could range freely through the whole gamut of the arts—could plan a building, carve its sculptures, and paint its domes. His training was no narrow or exclusive culture, but broad and central, embracing the permanent and universal in the great common language of Art. Mr. David then dealt with the extant works of Stevens, the most important of which he showed on a screen by means of a lantern. He referred to Stevens' appointment to teach in the Government Schools of Design at Somerset House, and his connection as chief designer with Messrs. Hoole and Co., ironfounders, Sheffield. Referring to the Duke of Wellington's memorial in St. Paul's Cathedral, he said it was the principal work of Stevens' life, and said it occupied him for a period of seventeen years, and was practically complete when he died. In considering that monument as a masterpiece of combined architecture and sculpture, one or two things characteristic of Stevens' work as a whole were seen there in finest form. In the first place the whole spirit and form of Stevens' art was classic. Reared as he was in the atmosphere of Italy—an atmosphere still laden with the fragrance of a time when art blended with all the thoughts and actions of men—Stevens was a belated and perfect blossom of that bygone era, and the whole spirit of his art, its broad and central character, its dignified rectitude, its striving after the greatest common measure of expression, accorded with the spirit of that time. The qualities of his work, like all things classic in spirit and form, were those that would survive all fashions, all peculiarities of time and place. His art would survive those because its principles were inherent in humanity as a whole, and in the very nature of art—principles that strive to embody the greatest common beauty and character, free from what was excessive, peculiar, eccentric, or the result of personal bias. Stevens caught up the

HOLY TRINITY CHURCH, KENSINGTON. THE LATE G. F. BODLEY, R.A., ARCHITECT. *Photo: Cyril Ellis.*

This is one of Mr. Bodley's last churches, the very last upon any considerable scale. It is a lofty building of simple character, in which there is an evident intention to rely greatly for effect upon the perspective of tall slim columns and the oblique rather than the direct or axial vista.

C

conception of the classical tradition, as it had been understood by the men of the Renaissance. He adopted the form of architecture, of painting and ornament, and the general manner and method of art as used by them, but he was no mere dull copyist or lifeless reviver of a past style. All his work was fresh and new, and animated with his own individual feeling. The architectural members employed in the Wellington monument were those that tradition, by centuries of use, had made familiar. Stevens' power as an artist was to be seen in the adjustment of those forms in a manner so contained in the vigorous and compact pattern of line and mass into which they combined. The forms and their proportions were as finely and justly conceived, and with such rare feeling for crisp piquancy of effect that the various members although familiar acquired a new and delightful beauty.

Our Plate.

The Burkitt Homes, Kings Lynn.

Famous as a seaport town for many centuries, Kings Lynn enjoys a yet wider fame among the artists of the world as a treasure store of architectural art. From the stately churches, which have ever been a proud possession of the town, down to the gem of a Custom House, which marks the apex of the neo-classic revival, the town can exhibit a whole range of interesting and beautiful buildings adorning its picturesque streets. It seems to have been impossible for the forefathers of Kings Lynn to erect a building, however ordinary, without investing it with some feature to charm the artist's eye. However commonplace the structure, it yet possesses a cornice, a doorway a quaint window, or an indisputable sense of proportion that lifts it from the rut of the undistinguished. Moreover the town can furnish examples of building of almost every style and period of English architecture, and thus possesses advantages over other English showtowns, such as Stamford, Abingdon, and Bath. It is not, therefore, remarkable that a visit to Kings Lynn has come to be regarded as a necessity by every student of architectural art.

Few of the passers-by in Queen Street, Kings Lynn fail to stop and gaze at the Burkitt Homes for old people, one of the latest additions to the charities of the town. Standing back from the road behind a trim grass plot, the building possesses quiet dignity and homeliness. The style adopted is Tudor.

The plan follows tradition very closely, though the somewhat awkward shape of the site introduced difficulties that required some amount of thought for their solution. A central tower, or gateway, pinnacled and battlemented, flanked by two low wings on either hand, forms the street front, and through the entrance archway a glimpse may be had of the grass court and sun dial round which the homes are ranged.

The buildings are faced externally with thin red bricks set with wide mortar joints, a combination that makes the brickwork effective and pleasing. The roofs are covered with red tiles, and the casement windows throughout are of wrought-iron with leaded panes and oak frames and sills. The court level is three steps above that of the pavement outside. Immediately on the right under the archway is the door of the turret staircase that leads to the board-room over the entrance.

This is a long narrow room, some 20ft. by 8ft. 6ins., with a big bay overlooking the centre court. At one end is the chimney-piece of oak, with simple Tudor tracery, fitted with a dog-grate in surrounds of dull red monastic tiling. The room has oak beams to the ceiling, and an elaborate dado, 3ft. 9ins. high, of oak, enriched with cinquefoil tracery. The door is elaborately enriched with tracery in the panels. The floor is laid with oak parquet. The fine oak table and the chairs, specially designed, will inevitably attract attention. They are Jacobean in design, the table having bossed legs and a fine stretcher, and the chairs the high backs and carved tops of the later period and Dutch influence. The lighting fixtures are suspended from finely-carved Tudor rose bosses at the intersections of the main beams. Outside the board-room is an ante-chamber, lighted, like the staircase, by windows in the front.

It is characteristic of many of our old almshouses that while much care and money have been expended on the board or governors' rooms and chapels, the homes themselves, which, after all, are the most important part of the foundations, are of the plainest and most uninteresting description. This is not the case with the Burkitt Homes, for the dwellings are even more elaborately fitted than the board-room. They are probably the most beautifully equipped buildings of their class in the kingdom.

As soon as one enters the central Court the doors of the twelve homes are visible, each with its little granite step, oak door and hood, the latter supported by ornamental wrought-iron brackets of simple design. Considerable ingenuity has been displayed in planning the homes at the angles of the court, but though they are not all arranged alike, the accommodation, fittings and equipment of each is exactly the same. The rooms are all on one floor, a thoughtful provision for old people, to whom stairs would undoubtedly prove troublesome. Each dwelling contains a well-lighted entrance lobby 2ft. 10ins. by 5ft. 9ins., with room for hats and coats, leading into a living-room about 11ft. square, off this, and separated from it by heavy curtains, is a bed alcove, 6ft. by 8ft. 2ins. of sufficient size for the double bedstead in oak, specially made, with which each dwelling is provided. This alcove has a separate window, and this necessary means of ventilation and the arrangement of the sanitary accommodation are notable points in the general planning. Out of the living-room opens a small scullery, with sink, and off the scullery is a small coal-cellar and light airy larder. The living-rooms and lobbies are panelled in oak to a height of 7ft. 3ins., the chimney-pieces are also of oak, with small open ranges, having oven and boiler, with bright steel canopies over, set in surrounds of red monastic tiling and fireclay, like the board-room. The ceilings have oak beams, and the floors are laid with oak parquet. A capacious cupboard is provided by the side of the living-room chimney-piece. The whole of the door furniture and light fittings are of wrought iron. Sunk mat spaces and mats are provided in the lobbies. The sculleries are paved with small red tiles, and have dadoes of salt-glazed bricks; the porcelain sinks are of the bowl type, dispensing with the necessity for washing bowls, and each is fitted with a teak draining board and plate rack. The sanitary fixtures are of the latest and most highly finished pattern, and are on a par with the other excellent arrangements. Separate entrances from the street are provided to the paved back courts, so that coal may be brought in and dust removed without entering the central court.

The forethought expended on the individual dwellings is, however, typical of the arrangements generally for the comfort and well-being of the occupants. At the extreme end of the site is a separate building containing the laundries and bath-rooms, by this arrangement all the hot-water fixtures and heating apparatus is concentrated under one roof. There are two laundries, each equipped with three porcelain washing tubs, with hot and cold water laid on, copper for boiling in addition to the water heater, an ironing table and mangle. The bath-rooms, of which there are two, are in the centre of the block. They have glazed dadoes, and floors of black and white tiling. The baths, of porcelain, are sunk three steps down in the floor, this being the most suitable form for old people, and strong rails are provided to enable the users to raise and lower themselves, and to prevent their slipping and falling. Heated towel rails are also provided.

The lighting throughout the almshouses is by electricity, a two-light fitting being provided in the living-rooms and single drop lights elsewhere. The central court is lighted by six lamps, carried by ornamental wrought-iron brackets projecting from the fronts, and a three-light fitting under the archway provides ample illumination at the entrance.

The court has been laid with turf, in the centre of which a Ketton stone sundial has been placed.

The plans were prepared by Mr. H. T. Tilson, and the contractors were Messrs. F. and S. Dickerson, of King's Staithe Lane, Kings Lynn.

Town Planning and Housing Notes.

The Planning of Suburbs.

Mr. Raymond Unwin delivered on February 10th, a lecture before the Leeds and Yorkshire Architectural Society. The paper was illustrated by an extensive series of views and plans of the Hampstead Garden Suburb, and typical examples of town planning abroad. The lecturer, in the course of his paper, said that the successful setting out of such a work as a new city will only be accomplished by the frank acceptance of the natural conditions of the site; and, humbly bowing to these, by the fearless following out of some definite and orderly design based on them. To straighten a river, level a hill, fill up a valley, or even cut down a fine clump of ancient trees, to make the site fit some preconceived design, would be presumptous folly. Such natural features should be taken as the keynote of the composition, but beyond this there must be no meandering in a false imitation of so-called natural lines. Let our avenues be straight or boldly curved, not aimlessly crooked, and let our open spaces be not shapeless patches, but squares, circles, or other orderly forms. The glittering path of the river as it winds across the plain, or the slope of the mountain range standing out in silhouette against the sky, delight us indeed; but the inconceivably complex conditions which form these curves have no part in any work of ours; and, in attempting to mimic them, we but miss that beauty of orderly design for the creation of which alone power has been given to us. The problem is complicated because it is necessary to consider not only what is desirable, but what is possible with the building conditions that are prevalent now. In the Garden City at Letchworth a considerable degree of harmony has been secured by requiring all roofs to be covered with tiles, while the very cheapness of the land at Letchworth, and the desire of many of the early settlers for the most countrified sites has led to an appearance somewhat too scattered for the best architectural effect. This, however, will gradually rectify itself, and if in some cases too great freedom has been left, this, in its turn, will help to foster local public opinion. In Germany there has been a great change in the style of their town planning. When the modern town-planning movement started, the formal and geometrical style typical of Haussmann's work in Paris, was adopted, and the work was much in the hands of engineers; but since the time of Camillo Sitte a more irregular and picturesque style of work has become prevalent, and is being carried to an extent which tends to destroy dignity and architectural effect. Taking the Hampstead Garden Suburb, by way of illustration, one can see the importance of carefully studying the site preparing a survey of the trees and other features on the land, together with a contour plan, before attempting to lay it out. The convenience of access to certain points such as the railway station, drainage facilities, proper gradients for the roads, etc., will indicate generally the lines which the more important ones will take, while the cutting up of the land into the building plots of suitable sizes, with due regard for economy in length of road and proper consideration for the aspects of the buildings, will determine in a general way the lines of many of the building roads. The preservation of the outlook across

View from Queen Street.

THE BIRKITT HOMES FOR OLD PEOPLE, KING'S LYNN. HERBERT T. TILSON, ARCHITECT.

THE CHURCH OF COWLEY ST. JOHN, OXFORD. THE LATE G. F. BODLEY, R.A., ARCHITECT.

This church stands alone in treatment and intention. It is a monastic church, built for the use of the Cowley confraternity. The long chancel, screened from the relatively short nave, is for the use of the fathers and brethren of the order. The public is admitted to the body of the church. The eastern end of the exterior, shown in the accompanying view, rises above the monastic garden. Along the southern and eastern walls runs a low flat-roofed building containing a cloister and vestries. The northern side is flanked by a chapel and a music school or practice room for choristers.

ıy open space available should be con-dered. It is also essential to secure a suit-ıle position to form the centre of the parish, ıburb, or estate, where may be grouped the ore important buildings. Having, in a ıeral way, determined all these factors, the roblem becomes essentially very much one the exact lines and arrangement of the ıads, together with the building lines, and ıe placing of the buildings must be deter-ined primarily on architectural grounds secure satisfactory street pictures, hether of a picturesque or more dig-fied and architectonic character. In ealing with areas devoted to cottages, ɔnomy in roads is the first consideration. t Hampstead, by means of a special Act of arliament, power was obtained to make ıads limited to 500ft. in length of a width of ɔft., provided the houses on each side were ɔt less than 20ft. apart. As justifying the ranting of this privilege the Trust bind ıemselves not to build more than an average f eight houses to the acre over the whole state.

The passing of the Town Planning Act af-ɔrds an opportunity probably for the first ıne, for controlling the character of sub-rban development, and it will be the duty of rchitects in future to regard their buildings s parts of a total picture rather than as iso-ıted units. At the same time, an immense pportunity will be afforded for considering treets and areas as a whole, and for produc-ıg architectural grouping on a large scale. f wise use is made of the powers given in ıe Act, and if the citizens, and especially the rchitects and surveyors, will co-operate, it ıay be possible to stop the devastation go-ng on round all our large towns, and begin ɔ build up suburbs worthy to be the homes f the people.

Housing Questions.

Mr. Howard Martin, at a recent meeting of he Surveyors' Institution, dealing with the Housing and Town Planning Act, said that if it was fairly administered in a practical spirit it would be productive of much good. He considered the clauses as to the warranty of fitness for habitation of certain classes of houses had been framed on a mistaken basis. While many tenement houses would be outside the provision of the Act, in other cases a question would arise as to the onus of liability to repair, as it would fall on the landlord under the law, and on the tenant under the lease. As to town planning, he considered that Eastbourne was an admirable example of the possibilities of the large estate dealt with on the leasehold system, while Newquay exposed the undesirable results which often followed from the small ownership system, under which everybody did just what he pleased. Landowners themselves should take the initiative in town-planning schemes.

Landlords' Future Liabilities.

A claim in the Manchester County Court by a tenant for damage done to his furniture through the defective character of the roof of the house resulted in a verdict for the defendant. It appeared from the evidence of the plaintiff and his wife that during the course of a heavy storm "a river of water" ran from the roof into the house. For the defence, expert evidence was given that the gutter was perfect of its kind, of the sort usually provided in working-class property and quite adequate to carry off the water. The trouble arose through an india-rubber ball being thrown up by children, which lodged in the gutter and caused a block in the down-pipe. Remarking that if the roof were sound, one would expect the water to run down the wall outside, Judge Parry asked an architect whether the flashing of the gutter on the house side ought not to be higher than on the street side. Witness replied that it never was in houses of a working-class character. He agreed, however, that if it were, the water would flow into the street in case of a dam and not into the house. The Judge: When the Housing and Town Planning Act of 1909 comes into operation, this form of gutter will have to be displaced, I think, for in cases of all houses up to the value of £26 a year a house will have to be "in all respects reasonably fit for human habitation," not only at the commencement of the holding, but during the holding. The Judge said the case was of importance. In his opinion it was proved that the gutter was defective in construction, but he was not satisfied that as the common law stood a landlord was responsible for defective construction in a house of this class, which was let at seven shillings a week. As he had pointed out, it would be different when the new Act came into force. He commended sections 14 and 15 of the new Act to the attention of all owners of house property up to the value of £26 a year.

Mr. Lever's New Prizes.

Mr. W. H. Lever has given to the School of Architecture in the University of Liverpool three prizes of £20, £10, and £5 annually for the best scheme for laying out the land near the church in the centre of Port Sunlight, to provide sites for a Village Library, Picture Gallery, a Gymnasium, and a College for higher education. Mr. W. H. Lever further offers, if he carries out any of the schemes submitted, to pay the author of it £100. These prizes are open to students both in the School of Architecture proper and the Department of Civic Design. The former include in their schemes designs for various buildings.

We understand that the (U.K.) Winget Concrete Machine Co., Ltd., of Newcastle-on-Tyne, have just received from one of H.M. Government Departments a further order for another "Winget" concrete machine, complete with ordinary outfit, pallets, etc.

Societies' Reports.

Liverpool Architectural Society.

At the second members' meeting of this society, held in the rooms of the society, 13, Harrington Street, Professor C. H. Reilly, who presided, referred to the formation of the City Guild, the object of which was to assist in the preservation and increase of the natural and structural beauties of the city and neighbourhood.—Mr. Edmund Rathbone read a paper, which was illustrated by lantern slides, on "The City Beautiful; or, Liverpool Compared with Cities Old and Modern." The lecturer remarked that it would be a very great benefit to Liverpool if the City Council were personally conducted over Paris at the expense of the city, under the guidance of our professors of architecture and town-planning, in order to show them what could be done in the way of beautifying a city, and also that something might be learned of the possibilities of street improvement by the introduction of properly selected and carefully tended trees. The subject of trees in our streets, the lecturer added, was entirely avoided by our city. The lecturer also agreed with a subsequent speaker that much might be done towards making our town squares possible as a resort of the wealthy by removing the forbidding iron railings around the portions of the squares which are laid out as gardens. —A vote of thanks was proposed by Professor S. D. Adshead, seconded by Mr. P. C. Thicknesse, and supported by Messrs. Gilbert Fraser and H. B. Bare.

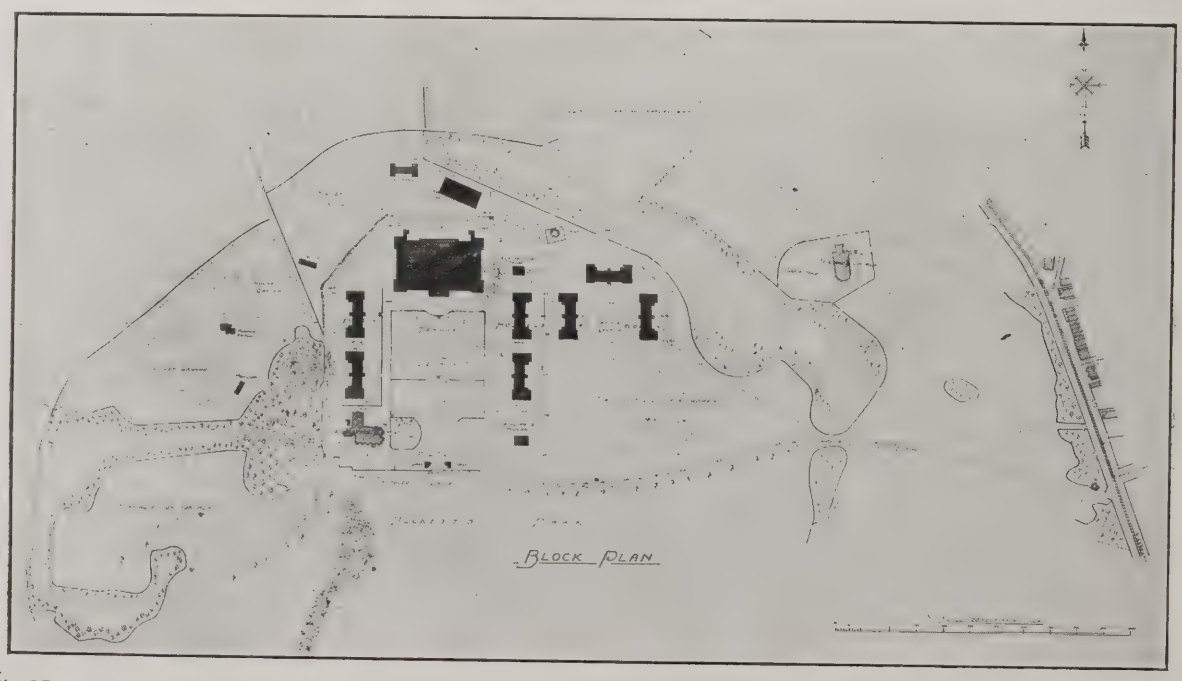
The Leicester and Leicestershire Society of Architects.

Mr. Arthur Marshall, A.R.I.B.A., read a paper on "Spanish Places and People." Mr. Marshall gave, in a delightfully humorous, and at the same time exceedingly interesting, way, the account of a visit of his to Spain. Starting from Bayonne, he detailed his journey across the Pyrenees to Fuentarabia, a mediæval town of great interest and beauty. A feature of strange character to English eyes was the large number of balconies, and one side of each balcony was, the lecturer explained, generally devoted to the culture of vegetables, and the other to the culture of flowers, while in almost every case there was either a chaffinch or a nightingale in a cage hanging over the centre. A remarkable feature in such an old-world town was an up-to-date electric installation, the power of which was produced by a mountain stream, the motive force being used to do all kinds of domestic work, even to the working of the humble mangle. San Sebastian and Burgos were described, and the handsome buildings of the former town were much admired, also a view in Burgos, "A Dusty Day." Mr. Marshall mentioned that the photograph had been exhibited nearly all over England and America. A few views of Madrid, and some clever photographs of a bull-fight were shown, the lecture concluding with two or three slides depicting "Spanish types of beauty," according to the title Mr. Marshall solemnly gave to them, but there was a good deal of laughter among the audience when the "types" were shown.

The Junior Institution of Engineers.

At a recent meeting of this Institution held at the Royal United Service Institution, Whitehall, the chairman, Mr. Geo. T. Bullock, presiding, the honorary members' lecture of the year was delivered by Mr. R. H. Hammersley Heenan, M.Inst.C.E., late consulting engineer to the Harbour Commissioners of Port Elizabeth, who took as his subject "The Creation and Development of a Successful Commercial Port." With the Harbour of Algoa Bay or Port Elizabeth as an illustration, the lecturer showed how great natural difficulties could be overcome in port development, and provision made for a satisfactory harbour. Both failures and successes were considered in the course of the lecture, reference being made to the breakwater of 1856, the design for docks in the bay in 1876, jetties and sea walls, mode of working the port, improvement of jetties, landing stage for explosives, hydraulic dock, slipway, land reclamation, and fishing interests. The effects of improvements and the results of experience were dealt upon, and the lecturer concluded with an interesting review of the various projects which had been put forward from time to time, including the latest proposal of Messrs. Coode, Son, and Matthews, the breakwaters of which would enclose an area of 740 acres, the general design being one recommended to the Harbour Commissioners by Mr. Heenan some years previously. When those great works would be carried out it was hard to say, but it was even more difficult to imagine a country with the enormous potentialities of South Africa, and with an enterprising and energetic people would neglect to develop when a suitable time arrived one of the most important ports which it possessed. It was moved from the chair, seconded by Mr. F. E. Powell, of the Auckland Harbour Works, N.Z., and supported by Mr. R. W. Newman, Mr. A. H. Tyler, Mr. J. Wylie Nisbet, and Mr. B. E. Dunbar Kilburn, that a cordial vote of thanks be passed to the lecturer.

Glasgow and West of Scotland Technical College Architectural Craftsmen's Society.



"Tiles and Tile Work" formed the subject of a lecture delivered on the 11th inst. by Mr. T. S. Allan to this Society. The lecturer referred to the vast improvement both in regard to materials and workmanship in this class of work, and also to its more extensive use in recent years. The process of tile manufacture was briefly described, attention being given to the various kinds, sizes, and qualities of tiles, and also to the geometrical relationship in size of the various flooring tiles. In dealing with the methods of fixing and of design, reference was made to work recently carried out, special mention being made of the interesting character of the work at the New Royal Infirmary (Glasgow), described as one of the finest examples in the country of what can be accomplished in tiles. In concluding, the lecturer called attention to the dirty condition in which many good specimens of tile work are to be found, remarking that with a liberal supply of soap and water the appearance of these would be considerably enhanced.

Northern Architectural Association.

At the fifth ordinary meeting of the session, held on Wednesday, February 16th, Mr. F. W. Rich, F.R.I.B.A., delivered to the members of the Northern Architectural Association at Higham Place, Newcastle, a lecture of special interest, the subject being, "The Flavian Amphitheatre, commonly called the Colosseum, Rome." Mr. Rich described the methods of construction and design of the building, illustrating his observations by a series of specially prepared slides, and exhibiting some specimens of the materials used in the building. On the motion of Mr. Charleswood, seconded by Mr. J. H. Morton, and supported by Mr. Jos. Oswald, the lecturer was heartily thanked. Mr. G. T. Brown (Sunderland), president of the society, occupied the chair, and there was a large attendance. Two members and seven associates were elected.

Institute of British Decorators.

The annual meeting of the Incorporated Institute of British Decorators (Scottish Branch) was held in Aberdeen on Saturday,

CITY OF LEEDS TRAINING COLLEGE, FAR HEADINGLEY. DESIGN SUBMITTED BY W. P. SCHOFIELD, A.R.I.B.A.

Mr. Robert J. Bennett, Glasgow, chairman, presiding. The secretary (Mr. George Cameron) submitted his report, showing a credit balance of £21 3s. 3d., which was adopted. The report of the committee, submitted by the secretary, stated that the membership of the branch as at December 31st last was 59, a decrease of 5 as compared with the total of the previous year. Two fellows and one associate had died, and there had been two resignations during the year. No new members had been enrolled, and this was a matter for regret, as there were many master-painters in Scotland who were eligible for membership. The committee was glad to be able to report that the funds of the branch were in a satisfactory condition. The Central Executive proposed a scheme for the formation of a capital fund, and the Scottish Branch agreed to contribute £15 for the year 1909 towards the fund, and this sum had been remitted to the general treasurer. The following officers were elected:—Chairman, Mr. Robert J. Bennett, Glasgow; vice-chairman, Bailie Dobbie, Edinburgh; secretary and treasurer, Mr. George J. Cameron; auditor, Mr. J. M. Orr, Glasgow. Mr. John Whyte, Aberdeen, was appointed representative of the district upon the General Council of the Institute. The following five members, along with the office-bearers, were appointed to constitute the District Committee:—Bailie Dobbie, Edinburgh; and Messrs. John Whyte, Aberdeen; John Scott, Glasgow; Henry Drummond, Dundee; and William Paterson, Girvan. The chairman, vice-chairman, and the secretary were appointed district delegates to meetings of members of the Institute.

The Tribunal of Appeal under the London Building Act, Mr. A. A. Hudson presiding, has reserved its decision in the appeal of the Berkeley Hotel Company against certain requisitions of the London County Council, under the London Building Act (Amendment Act, 1905). The proceedings mainly related to a requisition that the hotel company should provide swinging doors in certain of the corridors of the hotel, it being contended that in the event of an outbreak of fire such doors would tend to restrict the area which would be subject to fire and smoke risk. On behalf of the appellants it was urged that such doors were unnecessary, and that they would tend to render the service of the hotel inconvenient. Mr. R. Griggs and Mr. Percy Tubbs, F.R.I.B.A., were the expert witnesses appearing for the Hotel Company, while Mr. W. J. Ancell, architect, Mr. A. R. Dyer, of the London Fire Brigade, and Mr. J. C. Stransom, of the L.C.C. Architects' Department, gave evidence on the other side.

Notes and News.

The Blandford Town Council have in hand the question of repairs to the grave of Alfred Stevens, the sculptor, in Highgate Cemetery, in consequence of a letter received from the cemetery caretaker, stating that the grave was very much neglected and the bronze memorial damaged. The grave is vested in the name of a lady, who has signified her willingness to give way to the Corporation. A discussion took place on a proposal to raise a monument to Stevens in his native town of Blandford, but the subject was deferred until the committee has visited London.

* * *

The scheme of coast defence at Herne Bay proposed by the Working Colonies Committee of the Central (Unemployed) Body for London has been rejected by the Local Government Board on account of the large sums already advanced by Parliamentary grant for works in or in the neighbourhood of London, and on account of the sums that will be required to complete these works.

* * *

The examiners of standing order proofs, finding no proofs of the compliance with the standing orders, have struck out of the London County Council Tramways and Improvements Bill proposals for various tramways in Hammersmith, Hampstead, Islington, Paddington, and Lambeth. The bill, after report to the Standing Orders Committee, will now proceed to the first reading.

* * *

A memorial to the late Lord Grimthorpe, subscribed for by the parishioners, has been unveiled in Doncaster Parish Church. It was through the late peer's efforts that the church was rebuilt after destruction by fire, and in his will he bequeathed £4,000 for the care of the fabric.

* * *

Tenders for the new Quebec bridge will be advertised for after May 1st, and two months will be allowed for tendering. Plans have been provided for a cantilever bridge, but contractors may furnish alternative designs and estimates with their tenders. Particulars may be obtained from the Board of Trade, 73, Basinghall Street, E.C., but as only approved firms of bridge builders will be allowed to tender, it is advisable that they should move in the matter early, more especially as it may be necessary to send enquiries to Canada to ascertain the local conditions, etc.

* * *

Mr. Ronald P. Jones, M.A., architect, of London, an old student of the Liverpool School of Architecture, has given to the school a travelling scholarship for this year of £50, to be held at the British School at Rome. To this the British School has added a further £5. With these sums it is hoped that a student will be able to work at the British school for at least six months, and do a piece of restoration work under the director of the school, similar to that done at the French school, but of course of smaller scope.

* * *

With a view of demonstrating the advance that has been made in the machinery of the laundry and in the equipment of public baths and other institutions, the Society of Laundry Engineers is organising an exhibition at the Royal Agricultural Hall, London, in April next. This display of laundry machinery and sanitary appliances will include machinery in motion, practical work in progress, demonstrations of new processes, and other departments that should impress the public and educate the laundryman. Conferences on methods of work will be held, and altogether the exhibition is likely to prove an attractive event in the spring.

* * *

Messrs. Joseph Robinson and Co., Ltd., Carlisle, alabaster proprietors, and manufacturers of plaster of Paris, Keene's, Parian, and of Robinson's fireproof cement, have issued an illustrated list of these materials, which contains also two illustrations of the Irish International Exhibition, which was held in Dublin in 1907, which were constructed entirely of Robinson's plaster, and consumed more than 1,350 tons. The many testimonials as to the value of Robinson's cement include the convincing testimony of Mr. Henry Faija and the late Sir Eyre M. Shaw, who wrote: "I am of opinion that this cement would be much more effectual in preventing the spread of fire than any of the common plasters or cement generally used in this country."

The prospectus has been issued of the African Marble Colonial Company, of Hamburg, which has been formed with a capital of 3,000,000 marks (£150,000), to exploit the marble deposits in German South-West Africa. According to the prospectus, geologists have ascertained the presence of marble deposits in the Habis, Karibib, Navachab, Skakopmund, Kubas and Sphinx districts, which are described as unparalleled in the world.

An influential meeting was held recently at Edinburgh to consider the desirableness of federating in some manner a number of existing organisations all interested in the preservation of Old Edinburgh and the general amenity of the city. The Cockburn Association, it seems, is on the eve of being dissolved, but those who have been connected

with it and others think the time has come when a new organisation with the same objects in view should be formed on a wider and more popular basis. Among the speakers were Mr. W. B. Blaikie, Professor Baldwin Brown, Mr. Thomas Ross, architect, Professor Geddes, Sir James Balfour Paul, and Mr. Victor Paton. After a free interchange of views the meeting was of opinion that as a first step a conference of the several bodies interested in the subject should be called, and for this purpose a small executive was nominated to arrange preliminaries.

* * *

Mr. Henry Vivian, M.P., at a discussion at Sion College on "Co-partnership in Housing" (Canon Scott Holland in the chair), said the co-partnership in housing movement was designed to cope with the terrible evil of housing. Over half a million people were living at the present time in one-room houses, and two million in two-room houses. The co-partnership scheme stood for two ideas—first, that of laying out an estate so that it should for all time stand for the interest of the community as a whole, and, secondly, that of linking up the interest of the individual with a sense of possession in that estate. They felt that, so far as housing was concerned, their movement did make an advance towards the solution of the problem. The movement was based upon a long view of the profit to be gained, and not of the short view such as obtained on the ordinary building estate. They claimed for their co-partnership societies that the investor in them would get a safe return for his money, and they succeeded in so ordering the development of their estates that year by year the security of the investor would so increase that in 30 years' time, instead of being shunned, the property would rise in value and in demand.

The famous Rialto Bridge, Venice, is causing some anxiety to the authorities. Cracks have been detected in the vaulting of the arcade which covers the bridge. Steps are being taken to arrest the damage and to prevent further mischief; but the suggestions that the stalls should be removed or that the present wooden arcade should be replaced by one of iron have been indignantly rejected.

* * *

At a meeting of the Epping Rural District Council, Mr. R. F. Bury urged that the Council should endeavour to obtain some powers to prevent the indiscriminate building of bungalows on the banks of the Lea at Nazeing and Roydon. Not only did these flimsy erections depreciate the value of the neighbouring properties, but as a result of their great increase it would soon become necessary to have a special sewerage scheme. The chairman, Mr. Marsh, said he feared they could obtain no such powers, but it was decided to have a special report prepared by the council's surveyor.

Messrs. Wailes, Dove and Co. (1906), Ltd., of London (10 and 11, Lime Street, E.C.), Liverpool, Newcastle-on-Tyne, Cardiff, Glasgow, Birmingham, Leeds, Hull, and Philadelphia, U.S.A., proprietors of the patent "Bitumastic" anti-corrosive solution, announce that, owing to the increasing volume of business in the Lancashire district, they have opened an office in Manchester, at 49, Blackfriars Street, where Mr. W. Lawson, from the firm's London office, will now be their representative. Their Manchester telephone number is 2318 City.

* * *

A red-brick building in Queen Anne's Gate, now nearing completion, is to be utilised by its owner, Sir Edward Tennant, as an art gallery for the use of the public. The gallery, which contains some beautiful examples of British art, will probably be opened to the public in May. The collection was gathered by the late Sir Charles Tennant, and comprises several examples of Gainsborough, Hoppner, Romney, Reynolds, Constable, and Turner. It is proposed that an entrance to the gallery be made in St. James's Park, in which case the sanction of the Government will be necessary.

GARDEN PLANNING IN RELATION TO THE HOUSE.*

By Miss Lorrie G. Dunington.

The Origin of the Garden.

The true beauty of the garden is dependent on three main conditions, all of which are indispensable: 1st, excellence of design; 2nd, suitability of material; 3rd, harmonious planting. By what reason does a garden exist? Is its origin to be found in religion, utilitarianism, or mere æstheticism? Is it subservient to, or independent of architecture? In contemplating the history of the human race and its gradual evolution from primitive man up to that product of sociology and education which marks the progress of our own times, we find that the art of gardening like that of architecture follows closely the wave line of advancing civilisation.

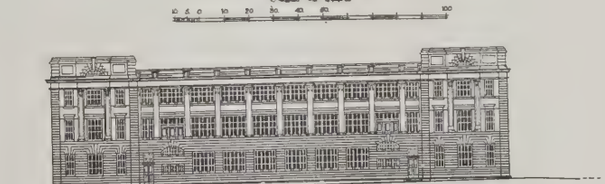
Ancient Egypt supplies the prototype of modern Western architecture; and since gardens have ever been associated with buildings, the question arises, What primeval motives prompted their construction? Archaic architecture might almost be regarded as a compilation of local materials arranged conveniently to meet the need for which they were intended. That is to say, the form, construction, and decoration of the building were the direct outcome of the materials used. Therefore, modifications in style were the result chiefly of the importation of new materials as well as the evolution of ideas.

The First Gardens.

The Egyptian temple, though of massive stone construction, probably drew its inspiration from nature. The hillocks of sand rising out of the desert may have suggested its form, and the reed and the lotus its ornamentations. Although, the stone of which these temples were built was not always found *in situ*—on the contrary, it was frequently brought from a great distance—still its universal adoption gave rise to a national and racial style, and a uniformity approaching that of localism.

Surrounding these buildings of severe and rectangular outline were the first gardens of which we have any definite record. Their primary object was probably to serve as a barrier to keep at bay the ever-encroaching sands of the desert. Further than this, they provided shade from the scorching rays of the sun and seclusion from the eyes of the curious. The fertile and irrigated land which they comprised was used by the priest for the growing of plants for use in religious ceremonies. In design, these gardens were essentially formal, often little more than a mere repetition of straight lines, yet they were suited to their purpose, and were at least in harmony with the buildings they encompassed. They were, in fact, veritable oases in the desert, with their tanks of cool water, fresh green turf, and rows of slender cypress. Nor were they without their arbours and trellises. The avenues of sphinxes which lined the main entrances to the temples were religious symbols, and probably had nothing to do with garden design, though they may have suggested the introduction of statuary into the gardens of Greece and Rome.

The Garden and the Building.



Thus we see that gardens in their origin were made to conform to the lines of the building, and were entirely subservient to it. Their first object was utility, and the degree of their æstheticism was indicative of the state of civilisation at the time. Abstract beauty is not greater to-day than it was then; but, by development of ideas, man has grown more conscious of its presence, and therefore is capable of giving it greater expression. So true is this, that

one can form a correct conception of the moral and intellectual condition of a nation by studying its art and architecture.

With the further development of art, gardens became the necessary adjunct of voluptuous public and domestic architecture. Pleasure grounds of considerable extravagance surrounded the palaces as well as the temples, and by the time gardening had spread westward to Greece and Rome, its original purpose was obscured by a reckless expenditure of wealth and an overwhelming indulgence in sensuous living. Gardens were regarded as a luxury, and were almost entirely confined to the rich.

There is every reason to suppose that the villas built in England during the Roman invasion possessed gardens, formal in design, and similar to those of Rome itself, though less pretentious. Owing to the subsequent invasion of barbarians, no evidences of these gardens now remain, the houses, on the other hand, being of more permanent construction, are still traceable in various parts of the country. With art once again at zero, in as far as Britain was concerned, we were forced to turn to religion for its revival. Christianity fostered and spread the garden, which was now more rigidly utilitarian and less æsthetic than its Egyptian ancestor. Treading on the heels of this revival came the peace and prosperity which resulted once more in artistic extension, and in gardens for pleasure as well as for use. But it is interesting here to note that the usefulness of the garden has never since been lost sight of, and the most successful 20th century garden is the one which displays the greatest amount of usefulness and beauty.

Formal Design.

If precedence alone could give superiority to one style over another, then the formal design holds an unassailable position. Anywhere between 2,000 and 4,000 B.C. up to the beginning of the 18th century, formality stamped and governed the planning of the gardens of the Aryan race. With the Mongolians it has been different, and it is stated that it is to China we owe the introduction of the so-called "Natural" style, which has played such havoc with our traditions and swept away so many of our beautiful English gardens.

The art of garden design in England was at its zenith during the seventeenth and early eighteenth centuries. Never before had there been gardens of such excellence in this country. The peaceful old manor-house garden of the sixteenth century was insufficient to meet the demands of the public, which was then feeling the influence of the Italian Renaissance, and the new ideas from the Continent wrought many changes in the English home and court circles. Yet something more than improvement of design was responsible for this sudden uplifting of garden-craft. Previous to this, it had been customary for the architect to design both house and garden, and the result was good up to a certain point. There was a general harmony of expression and unity of purpose between house and grounds, which could not fail to be reposeful and pleasing in effect. The science of horticulture was advancing with equal rapidity, and owing to the very numerous introductions of exotics, the materials at the disposal of the gardener were greatly enlarged. People began to take a keener interest in flowers, trees, and shrubs, and the garden became something more than a formal enclosure brightened haphazard by a limited number of old-fashioned flora. The garden of the future was to depend not only on architectural design, but also on the plants and trees it was intended to contain. Here was a difficulty to be overcome. The architect's knowledge of horticulture was not sufficient to meet the case, neither was the ordinary gardener competent to undertake the planning in addition to the planting. It was at this point that a French school of garden design came into existence, with Le Notre at its head. Here we had the horticulturist sufficiently trained in architectural design to enable him to plan the "lay-out" in sympathy with the building. I need not dwell on the causes or effect of the decadence which followed this period of brilliance, and which lasted for over a century. Suffice it to say that we are at this present moment undergoing to a certain extent a revival of that lost splendour. But we are accomplishing more than that. The greatest beauty the seventeenth century had to offer would not satisfy the twentieth century public. This is perhaps a bold statement to make, and the upholders of the "Good old Times" are possibly ready to dispute it. Humanity cannot for ever be supported by the memories of a past success, but rather should use it as a stepping-stone to higher achievements. The reason why the seventeenth century garden would not meet modern requirements is because we have outgrown it, just as the seventeenth outgrew the sixteenth century work, and to revive it in its entirety would be a retrograde step. The tangled and often empty flower border of a former age would not be tolerated to-day by those fastidious gardeners who demand leaf and blossom in unbroken succession for nine months in the year, and even make the midwinter months produce a modest contribution to the floral feast.

Principles of Design.

In England, at least, a garden continues to mean to most of us an enclosed retreat—a place for rest and mental refreshment, where we can enjoy, unobserved, the pure enchantments of nature. Its value does not lie in the intricacy of its design, nor upon the money expended on its construction, for beauty is no more a slave to wealth than is happiness. The modest cottage garden is frequently more soul-satisfying than its more pretentious neighbour within the park gates. On the other hand, the designer must bear in mind the extent of his client's purse when preparing his plan; for although, as we have seen, beauty transcends monetary considerations, yet the successful designer is a practical man as well as an artist. It is easier to bury gold unseen in excavations for a garden than in the bricks and mortar for the house, and what appears at first sight to be an inexpensive design may in reality prove a most costly one. Simplicity is seldom cheap in this world.

It is impossible to lay down any hard-and-fast rules regarding the planning of grounds. Each site suggests its own requirements, and each building its setting and style. But, broadly speaking, the skill of the designer lies chiefly in making the most of existing features, in the overcoming of difficulties and in preserving a sense of individuality untainted by affectation.

The most successful layout is the one which, when finished, looks so obvious and unobtrusive in arrangement that it would be difficult to picture it otherwise. It is, in short, the one which frequently calls forth the least praise from the uninitiated. There are some who, in their endeavours to produce a faultless design, will at start uproot every tree on the estate, exalt every depression, and lay low every mound, but what they gain by the abolition of a few obstacles does not compensate for loss of character and feeling. Any departure from convention is permissible, providing that the reason behind it is a good one. This is especially true of the remodelling of an existing garden of some maturity. Any who have undertaken such a task will have found innumerable hindrances to the carrying out of preconceived ideas. The size of the forecourt, the length of the paths, the width of the terraces, all may have to be readjusted in order to preserve some fine old timber or rare shrub. The "clean slate" method is undoubtedly the easier, but the inevitable sacrifice which it entails lays it open to just condemnation. Even when dealing with a new site, the designer should weigh carefully in the balance the removal of a single tree.

It is essential to pay considerable attention to the main entrance to the grounds from the road, as it is here that the visitors gain their first impression of house and garden. The drive and forecourt should be quiet and subdued in design, with just sufficient well-thought-out colour to suggest cheerfulness and good taste. Anything approaching ostentation should be strictly avoided. But when we come to deal with the garden proper, we can allow ourselves a greater licence, colour must abound, and the design, now less restricted, should offer peace and pleasure for every changing mood.

Garden Planning.

Garden planning does not begin and end at the draughtsman's table; indeed, that is the least important part of it. A house may be designed for to-day, and is complete when the last labourer has left it, but we make gardens for a future generation. We only begin the "layout"; others carry it on, and the work is never done, and fifty years of neglect will obliterate it from the face of the earth. Half the materials we use are inanimate, and the other half are living, and, therefore, ever changing. Who shall say that Bacon was wrong when he called gardening a more difficult art than building?

The overcrowding of ideas is the commonest fault of the beginner. Most plans from the 'prentice hand contain sufficient special features for half-a-dozen gardens. Moreover, a garden is not an architectural museum. It can be in perfect harmony with the house and still be devoid of masonry and statuary; and unless the latter be really good, it is better absent. There are few who realise to the fullest extent the value of a well-formed grass bank of geometric design, or who are conscious of the exquisite charm of the shadows it may cast in sunlight.

Gardens, being less permanent than buildings, are more influenced by passing fashions. At the moment no garden is considered complete without a "pergola," and so, with a happy disregard of all laws of design and good taste, we see this unfortunate alien from Italy erected in almost every plot of ground large enough to take it. If there be no south slope available for it and its roses and vines, then it is placed on the north and covered with ivy—a sad and useless object, leading from nowhere to nowhere. The sun-dial is another feature much misused. Savouring of a past age, it suggests itself as a centrepiece for an old-fashioned formal garden. Yet, how often do we see it set up in "Suburbia" with nothing to link it to its surroundings. But still more incongruous is it when one meets it in the forecourt of a public building, or in a London soot-laden garden.

Materials.

We have already seen that materials produce style. This is true, not only of buildings, but also of gardens. All architectural introductions into the garden should be, as far as possible, of similar materials to those used in the construction of the house. This may appear a mere platitude, and yet we not infrequently meet, in otherwise well-planned gardens, an absolute dissimilarity of materials.

Wherein lies the charm of a Surrey pine-wood garden? It certainly owes a deep debt of gratitude to both Miss Gertrude Jekyll and Mr. Lutyens, but even their joint skill could not have produced so distinct a style had they not had the assistance of local materials. Where would the Munstead gardens be without their Bargate walls and their pine and chestnut copses? With the house built of stone, quarried probably on the site, garden walls to match, paths of sand and flower beds of warm, light earth, what could be more harmonious in its conception? But what is suited to the Surrey pine-woods would be out of place on the chalk downs of Kent, or the clay of Middlesex. If the house be of London yellow

THE CHURCHILL COTTAGE HOMES. SILCOCK AND REAY, ARCHITECTS.

These Homes were built in the Cheddar Valley, Somerset, by the late Mr. Sidney Hill, J.P., whose object was to provide twelve comfortable homes for the deserving poor. The walls are of sand-faced brick, with roofs of red hand-made tiles, and window frames of oak,

brick, then let yellow bricks form the garden walls and steps. To import stone or other materials of greater refinement would be to accentuate the mediocrity of the building. In these days, however, of easy transits by road and rail, few people care to preserve a local style by the use of materials close at hand. They choose their gardens much as they do their carpets, by consulting a pattern book. Their fancy is caught by a fashion, and they succumb. The house is for the time being forgotten, as are also the surrounding conditions. Nor does the folly end here. Affectation creeps in in many subtle ways. At the present moment there is a revival of the gardens of a couple of centuries ago. There is a desire to reproduce ready-made antiquity. What is more delightful than a walk paved with old York flag-stones? Age has mellowed, and frost and rain broken it asunder. Vegetation has sprung up in the crevices and the whole is sweet with memories. Compare this with the handiwork of the modern man who first lays a discarded London flagstone, and then shatters it to bits with a hammer that it may present a crazy as well as an antique appearance. Will these paths we so construct live to be a joy to future generations? I think not. This is what I mean by retrogression in garden craft. Let us take the best of what has gone before, and then with sound materials proceed to greater attainments.

Harmonious Planting.

This last point I will touch upon but briefly, and it shall be more of the nature of a plea for greater attention to this branch of garden craft. Of what avail is a design, however beautiful on paper, if it is unsuited to the successful growing of flowers and trees? Materials control design. How then can anyone design successfully without knowledge of the materials which are necessary to the carrying out of ideas? I plead for a greater application to the study of horticulture by all those who aspire to the art of garden planning.

Trees and Shrubs

used in garden making fall under two headings:—(1) Those used architecturally, when they supplant more permanent materials, but at the same time are made to fulfil the same duties. Here we include the clipped hedge of yew or beech, the trim edging of box, the pleached alley and the topiary tree. To class these as unnatural, and therefore unsuitable features, is scarcely a fair criticism, since they are not intended to replace trees of natural growth, but act as foils to them. Most people will admit that the herbaceous border never looks so well as when backed by a wall of sombre green, and that the terrace gains much by the judicious use of trees of formal outline. (2) Under the second heading we have trees, shrubs, and flowers used exclusively for decorative purposes, and these are allowed to grow more or less as nature dictates. At the same time, due attention should be paid to the artistic grouping of colours, the value of light and shade, and the planting for bold effect; and it would seem that this is worthy of special study, in order to bring out the fullest possibilities of the garden. With higher ideals before us and an increase of knowledge and experience, we can look forward to achievements greater than those of the seventeenth and eighteenth century masters.

The Commissioner of Woods and Forests (whose powers are of wider extent than in his title implies) having declined to permit the erection of a theatre on the site of public baths in Orange Street, Charing Cross Road, the Westminster City Council has been unable to carry through a scheme for the sale of the baths. The refusal of the Commissioner of Woods and Forests is made "in view of the great importance of safeguarding the National Galleries in every possible way." The City Council has now decided to close the baths indefinitely.

Buildings in Progress and Completed.

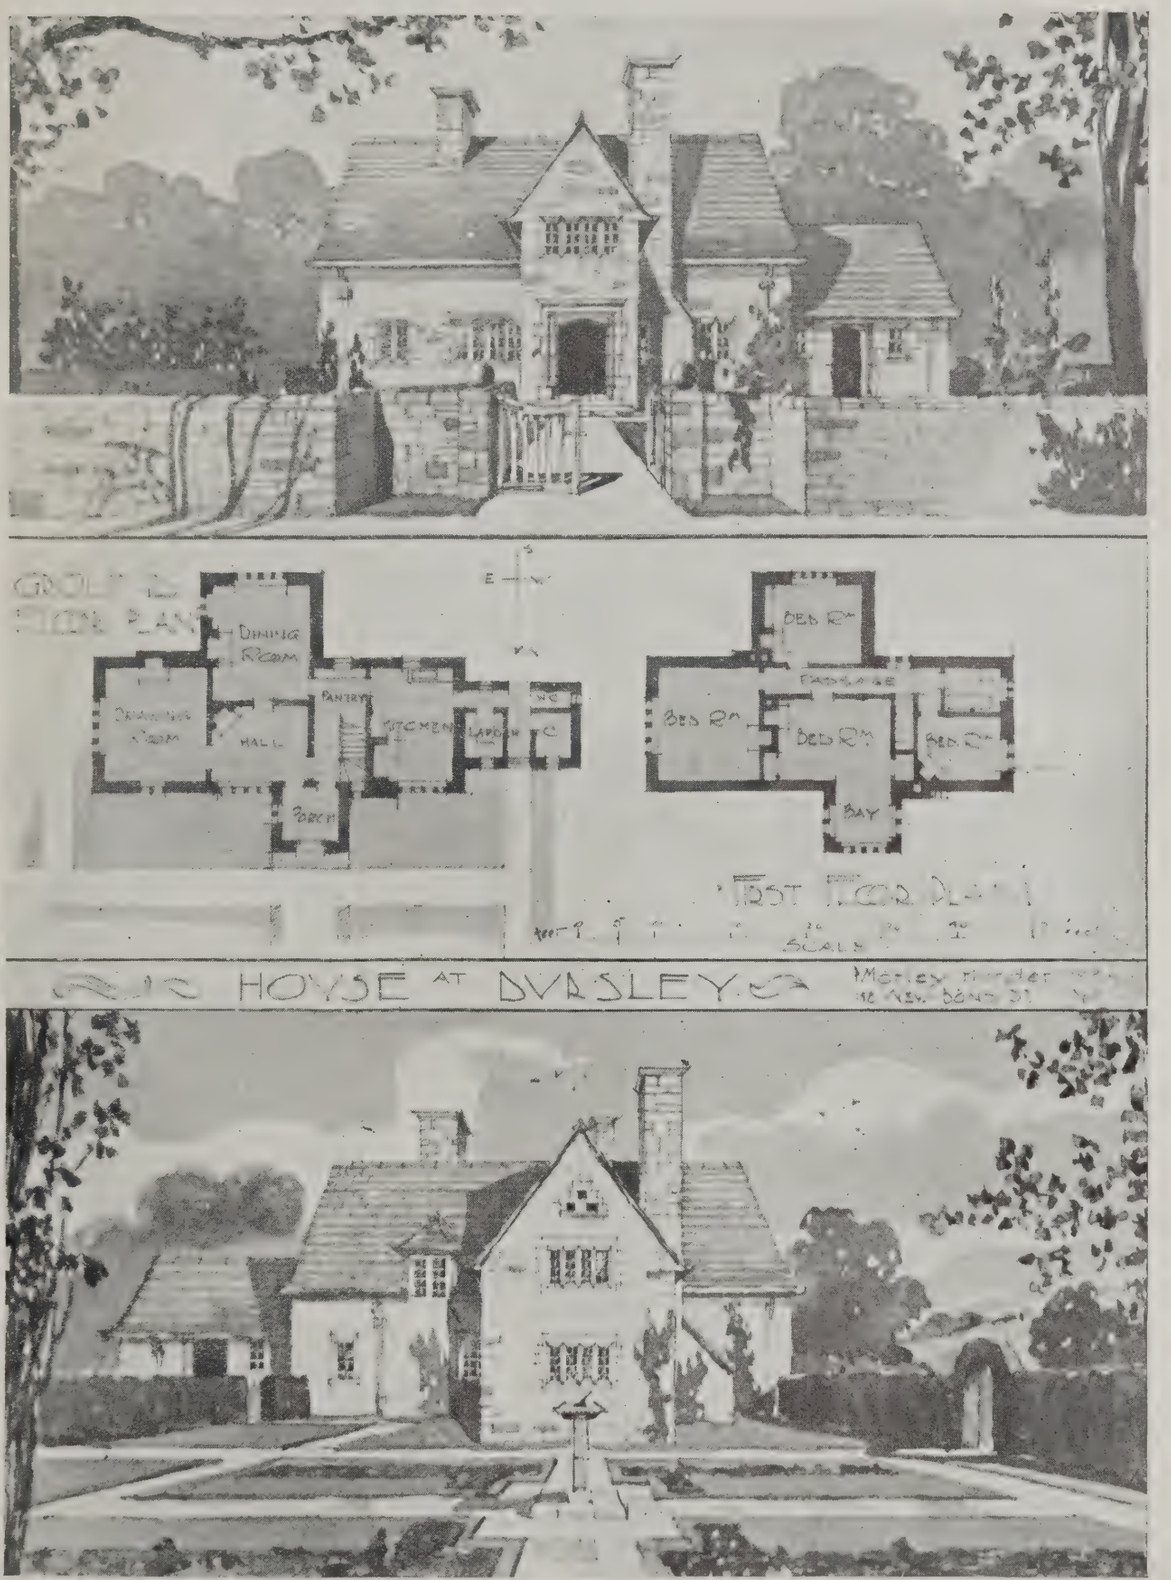
CREWE.—The tender of Mr. C. W. Davenport, of Stockton Heath, Warrington, at £22,990, has been accepted by the Cheshire Education Committee for the erection of the Training College.

GATESHEAD.—The St. George's Parochial Hall and buildings, designed by Mr. Richard Wyllie, A.R.I.B.A., which were illustrated in our pages from the architect's drawings, have been opened. The buildings are of coursed rock-faced stone walling to main elevations, with chiselled bays and dressings, and are roofed with grey slates. The floor in the vestibule is of terazzo paving, and in the parish hall and elsewhere, wood boards on cement foundations. The windows are casements, fitted with Hall's patent pivots throughout. Fire-resisting materials are used as far as possible in all staircases and other constructional parts. The dado to large hall is of redwood cleading, which has also an open hammer-beam roof. The contractor was Mr. Alex Pringle, Cramer Dykes, and the principal sub-contractors were as follows:—Plumbing and gas-fitting, Messrs. T. A. Moffitt and Co.; ventilation, Messrs. J. Stott and Co.; heating and tiling, Messrs. Emley and Sons; painting and decorating, Messrs. Merrilees and Denton; and slating, Messrs. Nicholson and Son.

GLASGOW.—New club rooms have been completed for the Scottish Automobile Club in Blythswood Square, Glasgow. The rooms have been designed by Mr. A. Hunter, Edinburgh. The basement is occupied by the kitchen and a motor-house capable of storing from ten to a dozen cars; while the ground floor is taken up with dining-rooms, committee-rooms, smoking lounge, bathrooms, etc. On the first floor a common room is to the front, and another apartment is set apart for ladies. A comfortable billiard-room occupies the top floor.

LONDON.—The enlarged chancel and new reredos at St. Barnabas' Church, Kensington, has been consecrated. The main object of the work has been to extend the chancel by 15ft. to remedy the serious state of overcrowding experienced for many years past both by clergy and communicants. The new reredos has been erected by the parishioners and congregation as a memorial to their late vicar, the Rev. G. R. Thornton.

LONDON.—A scheme for the better protection of St. Paul's Cathedral from fire, which is estimated to cost about £20,000, is now in progress. The alterations affect chiefly the heating of the fabric. Up to the present the generating stations have been situated within the building itself. These are now being taken outside, and another improvement is the proposed removal of the workshops, which, as in the case of Westminster Abbey, form a permanent feature in the building. The cost of these alterations will, it is understood, be borne by the Dean and Chapter, who will receive assistance from the Ecclesiastical Commissioners and several of the wealthier of the City Livery Companies.



OXFORD.—The popularity of the Oxford Union Society and the growth of its magnificent library, has necessitated an immediate extension of the buildings. For this purpose that portion of the society's property now occupied by the steward's house and the billiard-room, will be utilised, and buildings erected in their place. The scheme that has received the approval of the Standing Committee is that prepared by Mr. W. E. Mills, A.R.I.B.A., of George Street, Oxford, and the work will be commenced at the end of the present term. The elevation shows, on the left or north side, the steward's house, which, by the way, will abut on St. Michael's Street. Due south of this will be the library and writing and smoking-room, whilst at right angles in the direction of Cornmarket Street, there will be a spacious billiard-room and reference library.

MANSELTON.—The new English Baptist Chapel, designed to seat 650, with school to accommodate 300, has been opened. The building is of local stone, faced on the outside with blue Welsh Pennant stone, with box ground Bath stone dressings. Internally the timber work is of the best selected pitch-pine. The total cost of the buildings is about £3,000. They have been erected by Messrs. E. Turner and Sons, Cardiff, from the designs and under the superintendence of Mr. W. Beddoe Rees, 3, Dumfries Place, Cardiff.

NEW KILPATRICK.—The reconstructed and enlarged Parish Church at Bearsden, New Kilpatrick, has been re-opened. The main features of the scheme are an increase in and reconstruction of the seating accommodation, the addition of a new chancel on the south, the extension of the nave on the north, the removal of the old circular gallery and the substitution of galleries over both transepts and the nave. The church is now cruciform in plan, and with the alterations which have been effected provides accommodation for a congregation of 1,260, an increase of 370. Oak has been utilised throughout. At the entrance of the chancel, an addition which has greatly enhanced the appearance of the building, a stone arch has been erected with small stone pillars. The ceiling is of oak, panelled with ribs which have gold bosses at the intersections. Marble has been used in the laying of the floor, in the centre of which is a diamond bearing the symbolic letters I.H.S. A brass railing has been placed in the chancel, in front of which stands the pulpit with a base of Caen stone and columns of alabaster marble. The upper part of the pulpit is of wainscot oak, and is richly panelled. In the chancel is a stained glass window gifted to the church by Mr. Matthew Henderson in memory of his wife. The organ has been reconstructed by Messrs. Norman and Beard, Ltd., London and Norwich, and is placed one half on each side of the chancel. The scheme of reconstruction, which has been carried out to plans by Mr. Henry Higgins, 248, West George Street, Glasgow, has cost over £5,000.

SUTTON-IN-ASHFIELD. — The new church of St. Michael's and All Angels', at Sutton-in-Ashfield, has been consecrated. The church provides seating accommodation for 650, and has cost £4,500, of which over £2,800 was in hand in July last. The church was commenced by the building of a stone chancel upon a site in Outram Street, an iron nave being added in 1892, with seating accommodation for 300 people. In 1905 plans were prepared by Mr. Louis Ambler, F.R.I.B.A., of London, for the permanent completion of the building. The present work consists of a nave about 80ft. long, 30ft. wide, and 50ft. high to the ridge, separated by arcades of five bays on the north side, terminating at the west end. The building has been designed in the 13th century (Early English) style. The external walls are of Bulwell stone, with Weldon stone dressings, and lined with brick, which is plastered, the internal arches and columns being of Ancaster stone. The roof is covered with red tiles. When completed, the tower and spire at the north-west angle near the main road will be the principal feature of the exterior.

TURRIFF.—The new municipal buildings are situated on the south side of High Street, next the post office. Externally, a free Renaissance treatment has been adopted for the front elevation of the building, which has a frontage of about 54ft. to the street. The front is built of selected and finely dressed red freestone ashlar from the Delgaty quarry. Though all on one floor, the building has a massive and well-proportioned appearance. Internally, the accommodation provided consists of a Council Chamber and Court Room, each measuring 23ft. by 18ft. at either side of a spacious entrance hall, and in the rear of the Court Room there are suitable witness and committee rooms and lavatories,

This house is an attempt to get all the varying conveniences of a small modern house and yet preserve the simplicity and character of the vernacular Cotswold style, with its random stone walling mullioned windows, and stone slab roof covering. The plans of the house explain themselves, and the general economy of space should be noted, especially in the matter of the position of the staircase.

etc. The Council Chamber is a finely proportioned room, with polished wood block floor, and has a finely moulded arch plaster ceiling, and the walls throughout have been treated in beautiful light tints. Mr. W. L. Duncan, Turriff, is the architect.

WHALEY BRIDGE.—The Derbyshire County Education Committee has accepted the contract of Messrs. Clayton Brothers, Poynton, for the erection of the new schools at Whaley Bridge. The cost will be over £6,000 for 340 scholars.

WIMBLEDON.—A new theatre is in course of erection for Mr. J. B. Mulholland.

Views and Reviews.

Heavy Timber Framing.*

It is surprising how in ordinary constructing work the design of timber framing is left to the ordinary workman. He works mostly by rule of thumb; the timbering may often be much too heavy, and, on the other hand, it may be too light, so that accidents or considerable loss may ensue. By long experience, of course, the workman obtains a knowledge of what will serve for various circumstances, but it is distinctly unwise to continue the present haphazard system, for no reliance can be placed upon such work. The construction of timber work ought to be designed by engineers as much as steelwork or reinforced concrete. Small details are very important, and the stresses have to be determined; therefore this book of Prof. Jacoby is very welcome. We may expect that in a few years it will be insisted that timber work, whether permanent or merely for the execution of other work, such as shuttering, shall be designed by the engineer. The author during the past nineteen years, in his course of structions in the College of Civil Engineering, Cornwall University, has taught by reference to problems involving timber construction, as well as those dealing with structural steel. This book is, in a way, a development of such study, and in it considerable attention is given to details in the design of joints, beams and trusses, though, as the author points out, it is the exception rather than the rule to give the same attention to timber structures as to those of steel, although it is essential in sound engineering practice that all connections and details should have the same degree of security as the framed members. Such details, for instance, as nails, their holding power, driven in various ways and in different forms; the distribution of stresses in the lateral resistance of spikes; the holding power of bolts and screws; the bending moment on a wooden pin; compression on a key; the proportion of washers and other such seemingly small matters are gone into fully, and the importance they have in rendering the work strong and efficient is clearly brought out. The work provides much valuable information on many practical points connected with timber construction, and the illustrations are distinctly of service, for, in many cases, they relate to actual examples that have been constructed. For instance, we find centres for various well-known bridges illustrated, and their design carefully explained in detail. There is a useful list of references to the illustrated articles on various timber constructions, in which we note reference to some centres for reinforced concrete bridges, but we find that no particular mention is made to the construction of forms for ordinary reinforced concrete work, and we think, in view of the important financial bearing that this has upon modern construction, the author might do well in future editions to treat this more extensively. Though there is one American book we know of published on the subject of timbering and cofferdamming and piledriving, the author of this book might also with advantage deal a little more fully than he has done with the subject. The theory particularly could be advantageously worked out and practical design and construction assisted by the provision of diagrams for reference as to the size of timbers necessary to resist various heads of water, the spacing of whalings of various thickness of laggings, and so on. In short, though the book contains much that is very useful, we urge the author to continue with his work, and furnish us, in future editions, with much more information in many other branches of construction in which timber is used. If he will analyse ordinary contractor's timbering in the same way as he has dealt with the aspects of many branches of the subject in this book, he will do very good service.

*"Structural details or elements of design in heavy framing." By Henry S. Jacoby, Professor of Bridge Engineering in Cornell University. London, Chapman & Hall, Ltd. Price 9s.

The "Diary and Handbook of the London Master Builders' Association" is issued with the object of providing useful information for those actively engaged in building operations throughout the metropolitan area. Its circulation is not confined to members of the association. There is, however, a useful list of officers and members, and a very interesting short history of the association. Among the useful information appended to the specially ruled diary, the National Form of Building Contract is included, as well as the revised N.A.O.P. agreement. The text of the London Building Acts (Amendment) Act, 1905, is given, as well as a list of district surveyors under the Act of 1894. The Government of London, so far as it specially concerns builders, is summarised, and there are several tables of money and measurement, besides postal information and other useful items. There is also a glossary of electrical terms. The list of building trade newspapers on p. 320 of this very handy book is in need of drastic revision. The Diary is issued from 31 and 32, Bedford Street, Strand, W.C.

Trade and Craft.

Messrs. Bayliss, Jones, and Bayliss.

With reference to the disastrous fire which occurred in the large electric power station at the works of Messrs. Bayliss, Jones, and Bayliss, completely destroying the building, and the very valuable plant it contained, we are informed by the firm that fortunately they have been able to arrange for a large and immediate supply of electric energy which enable them to resume work within a week of the fire. Customers, therefore, need not hesitate to entrust them with orders. The London offices and showrooms are at 139 and 141, Cannon Street, E.C., and the works at Wolverhampton.

Carron Rainwater and Sanitary Pipes and Castings.

The Carron Company, of Carron, Stirlingshire, have issued a useful catalogue of rainwater pipes and gutters, soil pipes, sanitary, general, and special castings, in which it is shown that the Carron Company have excellent facilities for the production of castiron goods, which they supply fine cast, galvanised, porcelain enamelled, or coated with Dr. Angus Smith's solution. Sink traps, drain traps, cisterns, gratings, and panels, door scrapers, stair tread protectors, wall plates, skid irons, window-frames, sash weights, and many other details in which the architect, builder, estate agent, and houseowner are interested, are included in considerable variety of form and pattern.

"Medusa" Waterproof Compound and White Portland Cement.

An attractive booklet issued by the Cubitt Concrete Construction Company, 260, Gray's Inn Road, London, W.C., shows that the "Medusa" Waterproof Compound was patented in 1907, and has now been employed in every part of the world, under every condition and in every character of construction in which Portland cement is used. The compound, when added in very small quantity to Portland cement, makes mortar, or other mixtures of sand and cement when used as a rendering, impervious to water. It thus extends the utility of cement, and enlarges the field of concrete construction. A mixture of two parts sand and one part cement with two per cent. of "Medusa" gives an impervious mortar, and the mixture need only be applied as a rendering coat 1in. thick. Again, hollow concrete blocks, made with cement to which one per cent. of the compound has been added, with five parts sand and gravel, are said to resist water better than blocks made in the proportion of 1 to 2 without the compound. The compound is recommended as being especially useful in making building blocks, cement plastering, roofing tiles, cellar walls, cistern and reservoir linings, conduits, sewer pipes, elevator pits, and in many other applications in which resistance to percolation is an object. It is declared that the compound, so far from lessening the hardening qualities of cement, may in many instances actually increase them.

The White Portland cement described in the same booklet differs in no respect, it is stated, from ordinary Portland cement, except as to colour. It is a pure white; and in order to preserve this purity, the cement should be mixed with white sand, crushed white quartz, ground marble, or ground white limestone. Whether used as stucco or in the form of concrete building blocks, white Portland cement obviously makes a very estimable addition to the architect's resources. The booklet contains several illustrations, and many convincing testimonials from users of "Medusa" and of White Portland.

Muribloc Partition Slabs.

Clean crushed clinker and the best English Portland cement, gauged to a set standard by special machinery, constitute the substance of the Muribloc partition slabs, the machinery used for mixing the materials ensuring uniformity of density and strength for every slab. The slabs are all true to shape, with sharp arrises, so that fixing and finishing are carried out with the utmost speed and economy. Every slab is tongued and grooved on all edges, the faces have a natural key, and will take nails and screws with ease and safety, so that they afford an effectual means of erecting partitions quickly and accurately, and the work can be finished with one coat of plaster, ⅛in. thick. Being innocent of any material that would cause expansion or harbour vermin, these slabs are peculiarly suitable for horticultural or bungalow work. They are nevertheless as strong as brick set in mortar, Messrs. David Kirkaldy and Son having certified that the crushing stress of the 4¼in. Muribloc slabs is 28.2 tons per foot square. Full particulars may be had from Muribloc (Partition Slabs), Ltd., Princes Wharf, Wandsworth, London, S.W.

It is stated in the firm's circulars that Muribloc partition slabs are manufactured with the utmost care, and that only clean crushed clinker and the best English Portland cement are used, which are gauged to a set standard by special machinery. A visit to the works substantiates these claims in the fullest possible manner. Mr. J. C. Snelling, the manager of the firm, is an enthusiast in all that pertains to cement. His father and grandfather were in the cement trade; and Mr. Snelling's very earliest memories and impressions are of that material, in which he has the profoundest belief. He thinks that almost everything could be made of cement or concrete; and in proof of his faith in it, he has constructed of concrete a lathe that has turned out excellent work.

The Muribloc factory at Princes Wharf, Wandsworth, is conveniently situated and admirably organised. The materials of which the blocks are made come mostly on barges, the cement from a distance, but the coke-breeze from plentiful sources of supply that are near at hand. The cement is of first-class quality, is selected and tested with the utmost care, and the supply on hand is always open to inspection by the visitor; and the breeze is subjected to a most elaborate process of screening, which the visitor may follow in detail.

The nicely adjusted mixture of materials is fed to a most ingeniously devised machine

THE MURIBLOC SLAB-MAKING MACHINE.

Its Inventor, Mr. Snelling, is seen in the background.

of which Mr. Snelling is the inventor, and for which he has secured, at home and abroad, about twenty-seven patents. In less time than it takes to summarise the operation, this machine moulds, shapes, and compresses the material into a slab of perfect shape and consistency. The working of this machine Mr. Snelling explains very lucidly by means of a small-scale model; and it is astonishing with what speed and precision the required amount of material for one slab is cut off, pressed top and bottom, laterally and internally, and the complete slab, with tongues and grooves, is pushed out on a board ready for the setting racks.

The operations throughout are automatic, the elimination of "human error" being as nearly perfect as can well be. Behind all the machinery, however, there are the brains and the personal equation of the highly trained concrete expert, whose knowledge of his subject is the result of lifelong study and experiment, and whose keen enjoyment of it all is manifest and infectious; and especially admirable is the strong insistence on quality, which, backed up by sedulous attention to every detail of mixing and manufacture, results in a product of the first class. The blocks are, as the circulars express it, manufactured and matured on scientific principles.

In the small bungalow which has been constructed at the works, the stability as well as the adaptableness of the blocks are clearly demonstrated. Muribloc walls and partitions are there seen hung with tiles, and faced with glazed tiling and with various kinds of cement. For all these and for any other finishes, the blocks present a perfect key.

Coming Events.

Wednesday, February 23.

CARPENTERS' HALL LECTURES. — Mr. Geo. P. Bankart on "The Art of the Plasterer," 7.30 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION.—Students' Meeting. Mr. W. Milburn, jun., on "Notes on Continental Hospitals," 7.30 p.m.

INSTITUTION OF CIVIL ENGINEERS.—Students' visit to the London Hydraulic Power Co., Grosvenor Road, Westminster.

ROYAL SOCIETY OF ARTS.—Mr. H. S. Smith on "Oxy-Acetylene Welding," 8 p.m.

Thursday, February 24.

LONDON MASTER BUILDERS' ASSOCIATION.—Annual Dinner, Whitehall Rooms, Hotel Metropole, 6.30 p.m.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—Mr. J. B. Fulton on "The Church of Santa Sophia."

ROYAL INSTITUTION.—Professor Silvanus P. Thompson's 2nd Lecture on "Illumination, Natural and Artificial," 3 p.m.

Friday, February 25.

THE ARCHITECTURAL ASSOCIATION DEBATING SOCIETY.—"That the Employment of a Quantity Surveyor is to the Interest of the Building Owner," Mr. Percy Gleed, R.A.S.I., for; Mr. S. L. Dale, A.R.I.B.A., against, 7 p.m.

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS (Southampton Row, W.C.).—Mr. W. W. Watts' First Lecture on "The History and Development of English Silversmiths' Work," 6 p.m.

CAMBERWELL SCHOOL OF ARTS AND CRAFTS.—Annual Exhibition of Students' Work at South London Art Gallery, closes at 10 p.m.

ROYAL SANITARY INSTITUTE.—Provincial meeting, Derby, at County Offices, St. Mary's Gate. Mr. G. H. Widdows, on "Derbyshire Elementary Schools: Principles of Planning," 7.30 p.m.

L.C.C. SCHOOL OF BUILDING, BRIXTON.—Mr. A. C. Davis (Saxon Cement Co.), on "Portland Cement," 7.30 p.m.

INSTITUTION OF CIVIL ENGINEERS.—Students' Meeting. Sir R. Hanbury Brown on "Irrigation Works," 8 p.m.

PHYSICAL SOCIETY (Imperial College of Science).—Professor Perry on "Telephone Circuits." Professor Lees on "The Laws regarding the Direction of Thermo-Electric Currents Enunciated by M. Thomas," Mr. H. R. Nettleton on "A New Method of Determining Thermal Conductivity," 5 p.m.

Saturday, February 26.

ROYAL SANITARY INSTITUTE.—Provincial meeting, Derby. Visits to Derbyshire County Schools at Langley Mill, Sandiacre and Long Eaton; also in Borough of Derby.

JUNIOR INSTITUTION OF ENGINEERS.—Visit to premises of Royal Automobile Club, Pall Mall, in course of erection, 3 p.m.

ROYAL INSTITUTION.—Professor Sir J. J. Thomson on "Electric Waves and the Electro magnetic Theory of Light" (3rd lecture), 3 p.m.

Monday, February 28.

THE ROYAL SANITARY INSTITUTE LECTURES.—Mr. E. J. Steegmann on "Elementary Science," 7 p.m.

R.I.B.A.—General and Business Meeting. Election of the Royal Gold Medallist. Election of members.

THE SURVEYORS' INSTITUTION. — Junior meeting. Mr. E. A. Rogers, on "Prospects in Municipal Surveying," 7 p.m.

Tuesday, March 1.

UNIVERSITY EXTENSION LECTURES ON ANCIENT ARCHITECTURE. — Mr. Banister Fletcher on "Early Christian Architecture (A.D. 4th century to A.D. 6th century)," British Museum, 4.30 p.m.

INSTITUTION OF SANITARY ENGINEERS.—Students' lecture. Mr. Nandy Hoskins on "Sanitary Law," 7 p.m.

Wednesday, March 2.

CARPENTERS' HALL LECTURES.—Mr. C. F. A. Voysey, on "Castles in the Air," 7.30 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION.—Council meeting, 7 p.m. Ordinary meeting, 7.30 p.m. Paper by Mr. Joseph Oswald.

THE ROYAL SANITARY INSTITUTE LECTURES.—Mr. E. J. Steegmann on "Elementary Science," 7 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. J. H. Stevenson on "Heraldry as Applied to Architecture," 8 p.m.

R.I.B.A.—Art Committee Meeting.

ROYAL SOCIETY OF ARTS.—Mr. E. Cooke on "The Teaching of Design," 8 p.m.

Friday, March 4.

ARCHITECTURAL ASSOCIATION.—Mr. J. A. Gotch on "The Mediæval House," 7.30 p.m.

ROYAL SANITARY INSTITUTE.—Mr. E. J. Steegmann on Elementary Science, 7 p.m.

LEICESTER AND LEICESTERSHIRE SOCIETY OF ARCHITECTS.—Mr. J. Armitage on "Wood-Carving," 8 p.m., at 5, St. Martin's East.

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row.—Mr. W. W. Watts' 2nd Lecture on "The History and Development of English Silversmiths' Work," 6 p.m.

L.C.C. SCHOOL OF BUILDING, BRIXTON.—Mr. E. P. Wells on "Reinforced Concrete," 7.30 p.m.

Saturday, March 5.

ABERDEEN ARCHITECTURAL ASSOCIATION.—Exhibition of Sketches and Criticism of Designs.

Monday, March 7.

ROYAL SANITARY INSTITUTE.—Mr. E. J. Steegmann on "Elementary Science," 7 p.m.

Tuesday, March 8.

ROYAL SOCIETY OF ARTS (Cantor Lectures).—Mr. Lawrence Weaver's First Lecture on "Lead Work," 8 p.m.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about **five days** or longer after the date of this issue.
Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders.
The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the Contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Feb. 16—March 8. **BIRMINGHAM.**—Erection of a Council school in Sladefield Road, Washwood Heath, for the Education Committee. Applications for forms of tender and bills of quantities may be made on or before Feb. 16, in the Finance Office at the Education Department, Edmund Street, Birmingham, accompanied by deposit of £2. Drawings may be seen in the Architect's Office at the Education Department. Tenders must be delivered to Jno. Arthur Palmer, Secretary of Education, Education Department, Edmund Street. Fair wages clause.

Feb. 23—March 7. **LICHFIELD.**—Erection of 16b married soldiers' quarters, in one block, for the Secretary of State for War. Plans, specification, and conditions of contract, may be inspected at the Office of the Director of Barrack Construction, 80, Pall Mall, London, S.W., or at the Barrack Construction Office, Whittington Heath Barracks, Lichfield, up to this day. Those desirous to tender and to receive a copy of the bills of quantities must apply to the Director of Barrack Construction not later than Feb. 25,, accompanied by a deposit of [illegible]. Cheques or orders to be made payable to the Assistant Financial Secretary, and crossed "Bank of England for Credit to Army Funds.' Tenders must be delivered to H. De La Bere, Director of Army Contracts, War Office, Whitehall, London, S.W.

Feb. 26. **LLEDROD.**—Persons desirous of tendering for the erection of a residence at Lledrod, near Llanilar, Aberystwyth, for Mrs. Thompson, are requested to send in their names to W. D. Jenkins, A.R.I.B.A., Architect, George Street, Llandilo, by above date.

Feb. 28. **YARMOUTH (I.W.).**—Extension of the Town Quay. Particulars may be obtained from J. A. Cole, Clerk Town Trust, Yarmouth, I.W., to whom tenders are to be sent.

Feb. 28. **MIRFIELD.**—Erection of four dwelling-houses, Coppinhall Road, Mirfield. Plans may be seen and quantities obtained of Ainley and Hirst, Architects, Surveyors, and Valuers, Slaithwaite, near Huddersfield, to whom tenders are to be sent.

Feb. 28. **SUNDERLAND.**—Re-construction of the roof of the Hallgarth Square Public Washhouse, for the Corporation. Drawing may be seen, and specification and form of tender obtained at the Borough Engineer's Office, Town Hall. Tenders must be delivered to Fras. M. Bowey, Town Clerk, Town Hall, Sunderland.

Feb. 28. **BURY ST. EDMUNDS.**—Erection of a new chemical laboratory and demonstration room, at King Edward VI. Grammar School. Plans, specification, and form of tender, can be obtained at the offices of Ainsworth Hunt, Architect, 51, Abbeygate Street, Bury St. Edmunds. Tenders to be delivered to John W. Greene, Solicitor, Clerk to the Governors, Bury St. Edmunds.

Feb. 28. **BELFAST.**—Erection and completion of Rosario male and female national schools, Ballynafeigh, Belfast, for the Very Rev. R. Crickard, P.P., V.F. Bills of quantities by W. H. Stephens and Sons, Donegall Square North, can be obtained from them on deposit of £1 1s. Tenders are to be delivered to J. J. M'Donnell, Architect, 27, Chichester Street.

Feb. 28. **LONDON.**—Execution of artificers' work at Salisbury Plain (Western Section), for one year from April 1, 1910, for the War Department. Forms of tender, conditions of contract, and all necessary information may be obtained on application by letter to the Commanding Royal Engineer, Royal Engineer Office, "C" Lines, Bulford Camp. Tenders are to be forwarded to the Director of Army Contracts War Office, Whitehall, London, S.W.

Feb. 28. **DUBLIN.**—Erection of station building at Creaghanroe, near Castleblayney, goods office at Keady, goods shed at Smithboro, for the Great Northern Railway Company (Ireland). Plans and specifications at the office of F. A. Campion, Chief Engineer, Amiens Street Terminus, Dublin, or copies at the office of the District Engineer, Belfast, and forms of tender on payment of 1s. each (not returnable). Tenders should be delivered to T. Morrison, Secretary, Secretary's Office, Amiens Street Terminus, Dublin.

Feb. 28. **NEWBURN.**—Erection of proposed Council Offices at Newburn, for the U.D.C. Drawings, bills of quantities, and conditions of contract may be seen and form of tender obtained at the office of Edward Cratney, Architect, 88, Station Road, Wallsend, by whom bills of quantities will be supplied on deposit of £2 2s. Tenders, addressed to the Chairman of the Newburn U.D.C., Clerk's Office, 1, Mosley Street, Newcastle, must be delivered to George Wilkinson.

Feb. 28.— **MERTHYR TYDFIL.**—Erection of twenty-two terrace houses in three blocks and six pairs of semi-detached villas, together with the construction of roads, sewers, and surface water drains, on the Meyrick Estate, Gwaelodygarth Field, Merthyr Tydfil, for the Grove Building Club. Drawings and specifications can be seen and forms of tender obtained at the office of T. Edmund Rees, Architect and Surveyor, Merthyr Tydfil. Tenders to be sent to Martin Evans, Solicitor, High Street, Merthyr Tydfil.

Feb. 28. **DARTFORD.**—Construction of an open-air swimming bath, for the U.D.C., in accordance with plans and specification, which may be seen at the office of the Surveyor, Council Offices, Dartford. Tenders must be delivered to W. Kay, clerk, Council Offices, Dartford.

Feb. 31. **MIDDLESBROUGH.**—Builders desiring to tender for the various works required in alterations to 59½, Linthorpe Road, Middlesbrough, can obtain particulars from Moore and Archibald, architects, 27, Albert Road, Middlesbrough.

March 1. **NAAS NO. 1.**—Erection of labourers cottages and fencing plots throughout the Rural District, according to plan and specification at the office of D. J. Purcell, Clerk of Council, Naas, when forms of tender and any further information required can be obtained.

March 1. **COLWYN BAY.**—Erection of a temporary pavilion for the Royal National Eisteddfod. of Wales. Those desiring to tender are requested to send their names and addresses to Darbyshire and Smith, Architects, 17, Brazennose Street, Manchester, not later than March 1.

March 1. **CHESTER.**—Alterations and additions to a public elementary school in Victoria Road, Chester, for the Corporation. Plans and specifications can be seen at the office of the Architect, Philip H. Lockwood, St. Werburgh Street, Chester, and quantities obtained on deposit of £1. Tenders are to be sent to J. H. Dickson, Town Clerk, Town Hall, Chester.

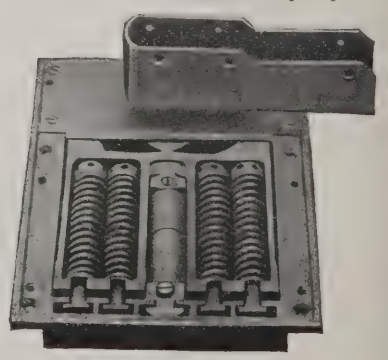
March 1. **EPSOM.**—Supplying and fixing complete (including all builder's and other work) a self-registering 10-ton weighbridge, of the size of 12ft. by 7ft. in the roadway at the Workhouse, Epsom. Further particulars can be obtained on application to the Master of the Workhouse. Tenders, on forms to be obtained of Alick G. Ebbutt, Clerk, must be delivered at the offices of the Guardians, "Gynsdale," Waterloo Road, Epsom.

March 2. **LUCAN.**—Erection of new shop and offices for Lucan and District Co-operative Society, Ltd., according to plans and specifications to be seen at the Society's premises, 3, The Mall, Lucan. Tenders to be addressed to the committee.

March 2. **KINGSTOWN.**—Construction of additional bathing boxes at the Royal Victoria Baths, Kingstown, for the U.D.C. Plans can be examined in the Town Surveyor's Office, Town Hall, Kingstown. Tenders will be received by J. Sherlock Vaughan, Town Clerk. Sureties required.

March 2. **SALISBURY.**—Carrying out certain structural alterations at the Municipal Offices, Endless Street. Plans and specifications can be seen, and bills of quantities with form of tender obtained, on application to W. J. Goodwin, A.M.Inst.C.E., City Engineer and Surveyor, Municipal Offices, Salisbury. Tenders must reach Francis Hodding, Town Clerk, Municipal Offices, Salisbury.

March 3. **HARWICH.**—Restoring the east windows, and other glazing, painting, and cleaning, to be done to St. Nicholas parish church, Harwich. Specifications and particulars may be obtained at Mr. Groom's Office, Harwich. Applications to be addressed "Renovation."



March 3. **PENDLETON.**—Structural alterations at the Union Infirmary, Hope, Pendleton, for the Salford Union. Specification and all particulars may be obtained from H. Lord, F.R.I.B.A., 42, Deansgate, Manchester, on deposit of £2. Tenders must be delivered to F. Townson, Clerk to the Guardians, Union Offices, Eccles New Road, Salford.

March 3. **CAMBRIDGE.**—Execution of the undermentioned work at Sheep's Green, Cambridge, for the Corporation:— (i.) Erection of additional dressing boxes at the women's bathing place, and (ii.) erection of a steel bridge over the river from Coe Fen to the bathing place. Plans and specification may be seen, and forms of tender obtained, at the office of the Borough Surveyor, Guildhall, Cambridge. Tenders to be delivered to J. E. L. Whitehead, Town Clerk, Guildhall.

March 3. **CHIPPING BARNET.**—Erection and completion of a new manual instruction and cookery centre at Byng Road, Chipping Barnet, for the Hertfordshire County Council. Drawings, specification, agreement, etc., at the County Surveyor's Office, Hatfield. Schedule of works (quantities) and a form of tender can be obtained at the County Surveyor's Office, upon deposit of £2 2s. Tenders must be delivered to Urban A. Smith, County Surveyor, County Surveyor's Office, Hatfield.

Highest Awards at International and Trade Exhibitions.
Telephone: 829 Central. Telegrams; "Robert Adams, London."

Efficiency and Scientific Simplicity.

Only 1¼in. deep.
Sealed Checking Cylinder.
No oil discolouration of floors.

March 4. **BRISTOL.**—Erection of a garage and workshop at 138, Victoria Street, Bristol, for the Bristol Wagon and Carriage Works Co., Ltd., Plans and specifications can be seen and quantities obtained at the offices of Henry Williams, Architect, Alliance Chambers, Corn Street, Bristol. Tenders to be sent to J. C. Chetwood-Aiken, Secretary, The Bristol Wagon and Carriage Works Co., Ltd., Lawrence Hill, Bristol.

March 4. **WAKEFIELD.**—Execution of the following works, for the West Riding Education Committee: Saddleworth Uppermill New School (builder, joiner, slater, plasterer, plumber, painter, road maker). Plans may be seen, and specifications with quantities obtained, on application to the Education Architect, County Hall, Wakefield. Deposit of £1 in each case must be sent by separate letter to the West Riding Treasurer, County Hall, Wakefield. Tenders to be sent to Francis Alvey Darwin, Clerk of the County Council, County Hall, Wakefield.

March 5. **DOWLAIS.**—Erection of a schoolroom at Caeracca, Pant, Dowlais, for the Bethania Congregational Church, Dowlais. Plans and specifications may be seen at 47, Winifred Street, Dowlais, where tenders are to be delivered.

March 5. **DISS.**—Erection of new stables, with fire engine house and harness house, in the Council's yard, in Chapel Street, for the U.D.C. Plans may be seen, and specifications obtained on deposit of 5s. Tenders must be sent to Alfred Cooper, Surveyor, The Terrace, Diss.

March 5. **SALE.**—Erection of a new County high school for girls at Sale, for the Chester C.C. Plans and specifications can be seen at the office of H. Beswick, F.R.I.B.A., County Architect, Newgate Street, Chester, and quantities obtained on deposit of £2. Tenders are to be delivered to W. Egerton Smith, F.C.A., Clerk to the Governors, 46, Brown Street, Manchester.

March 5. **TOTTENHAM.**—Erection of a permanent school to accommodate 1,636 children on the Down Lane site, for the Education Committee. Applications for quantities to be made to the Architect, G. E. T. Laurence, A.R.I.B.A., 22, Buckingham Street, Adelphi, W.C. Plans and specification may be seen at his office on deposit of £2 2s. Persons tendering will be required to deposit with the Clerk, when handing in their tenders, in Bank of England notes or cash, the sum of £10. Fair wages clause.

March 5. **NEW ROSS.**—Sanitation and alteration to Workhouse, comprising:—1, drainage and water supply; 2, erection and completion of sanitary annexes, etc.; 3, plumbing and hot water circulation; 4. erection of a new kitchen and annexe at the fever hospital, for the Union. Plans and specifications may be seen at the Boardroom, New Ross, and at the office of the Architect, J. A. Ryan, 33, Catherine Street, Waterford. Forms of tender are to be obtained from P. A. Pope, Clerk of the Union, New Ross, to whom tenders are to be sent.

March 7. **ABERDARE.**—Erection of a Workmen's Hall Institute and Free Library, at Cwmbach, Aberdare. Plans and specifications can be seen, and bills of quantities obtained, upon application to Thomas Roderick, Architect, Clifton Street, Aberdare. Tenders to be sent to G. J. Davies, Osborne Villa, Cwmbach, near Aberdare.

March 7. **EXETER.**—Additions and alterations at St. Luke's College, Heavitree Road, Exeter, for the Diocesan Board of Education. Particulars can be obtained on application to the Architect, James Jerman, F.R.I.B.A., 1, Bedford Circus, Exeter, to whom tenders are to be sent.

March 7. **HALIFAX.**—Alteration of the Old Riding School, Halifax, into an electric theatre for the National Electric Theatres, Ltd. Plans and specifications can be seen and quantities obtained of Richard Horsfall and Son, Architects and Surveyors, 22a, Commercial Street, Halifax, to whom tenders are to be sent.

March 8. **NEWPORT (Mon.).**—Supply of certain decorative oak fixtures, oak panelling, and other works, for Stevens, Confectioners, Limited, Cardiff, at the new premises, Davis Buildings, High Street, Newport, Mon. Plans can be seen and bills of quantities obtained of G. E. Halliday, F.R.I.B.A., 19, Castle Street, Cardiff, to whom tenders are to be sent.

March 8. **DARLINGTON.**—Erection of offices for the Locomotive Department at Stooperdale, Darlington, for the N.E.R. Plans and specification may be seen and quantities and further information obtained upon application to William Bell, the Company's Architect at York. Quantities supplied on personal application to parties tendering for the whole of the works. Tenders to be sent to R. F. Dunnell, Secretary, York.

March 9. **WINCHESTER.**—Repairs to some 46 cottages in different parts of Winchester. Specifications can be obtained of J. Ashton Sawyer, Chartered Surveyor. Tenders should be delivered to Walter Bailey, 19, St. Peter Street, Winchester.

March 9. **HUDDERSFIELD.**—Erection of an elementary school at Birkby, Huddersfield, for the Corporation. Plans, specification, and general conditions may be seen, and bills of quantities and forms of tender obtained on application at the offices of K. F. Campbell, M.Inst.C.E., M.I.E.E., Borough Engineer, 1, Peel Street, on deposit of £2 2s. Tenders to be sent to J. Henry Field, Clerk to the Local Education Authority, Town Hall, Huddersfield.

March 12. **SOWERBY BRIDGE.**—Mason and bricklayer, carpenter and joiner, slater and plasterer, plumber and glazier, cast-iron and steel, concreter, and painter's work required on the erection of a 5-storey cotton mill, Walton Street, Sowerby Bridge, for Mitchell Bros., Cotton Co., Ltd. Plans may be seen and bills of quantities obtained upon application, up to March 12, to Thos. Kershaw, A.R.I.B.A., Architect, L. and Y. Bank Chambers, Halifax, to whom tenders are to be sent.

March 14. **MEXBOROUGH.**—Erection of six almshouses, and other works incidental thereto, at Church Street, Mexborough, for the U.D.C. Plans may be seen and a copy of the particulars and bills of quantities obtained at the Council offices on deposit of £1. Tenders are to be sent to G. Fenwick Carter, C.E., Surveyor to the Council, Council Offices. Fair wages clause.

March 14. **HULL.**—Erection of a school in Southcoates Lane, for the Corporation. Drawings and specification may be seen, and quantities obtained upon deposit of £2 2s. with Joseph H. Hirst, City Architect, Town Hall, Hull. Remittances to be made payable to the City Treasurer. Tenders are to be addressed to the Secretary of Education, and delivered at the Education Offices, Hull.

March 15. **NEWBRIDGE (Mon.).**—Erection of a new church at Newbridge, Mon., for the trustees of the Zoar Welsh Congregational Church. Plans and specification may be seen with John W. Aldiss, M.S.A., Architect and Surveyor, Newbridge, Mon., and bills of quantities obtained by a deposit of £1 1s. Tenders to be sent in to Philip Parry, 19, Panteg Terrace, Newbridge, Mon.

March 21. **WATERLOO-WITH-SEAFORTH.**—Erection of a secondary and technical school in Cambridge Road, Seaforth, for the U.D.C. Plans may be seen and bills of quantities obtained at the office of the County Architect, Henry Littler, No. 16, Ribblesdale Place, Preston, by deposit of £3. Tenders must be delivered to John I. Thompson, Clerk to the Council, Town Hall, Waterloo.

March 21. **ST. HELENS.**—Erection of a new school, in North Road, St. Helens, for the C.C. On deposit of £1 1s. plans and specifications may be inspected and bills of quantities and conditions obtained at the office of the Architect, Frank S. Biram, George Street, St. Helens. Tenders must be delivered to Percival Sharp, Secretary for Education, Education Office, St. Helens.

No date. **SALISBURY.**—Repairs, cleaning, and painting, with new counters, shelving, etc. Specifications and plans now to be seen with C. Lane's, Ironmonger, Cranborne Salisbury.

No date. **BOSTON.**—Tenders are invited for the new Wesleyan Church Boston. Applications for quantities to be made to Gordon and Gunton, architects, Finsbury House, Blomfield Street, London, E.C.

C. Fread, Engineer and Surveyor, for the Urban District Council of Esher and the Dittons. Tenders are to be sent to E. A. Everett, Clerk, Council Offices, Brabant Villa, Portsmouth Road, Thames Ditton.

March 2. **PRESTWICH.**—Work and materials required in the construction of No. 6 distributing chambers, No. 6 percolating beds, supply main, etc., in accordance with the detail drawings, specification, and instructions of the engineer, Sydney H. Morgan, A.M.Inst.C.E., for the U.D.C. Drawings may be seen and copies of the specification, bill of quantities, and general conditions of contract obtained at the office of Sydney H. Morgan, A.M.Inst.C.E., the Council Offices, Prestwich, Lancashire, upon deposit of £2 2s. Tenders must be sent to Lewis A. Ortord, Law Clerk to the Council, Council Offices, Prestwich.

March 2. **TULLAMORE.**—Extension of the public water mains, for the U.D.C. Contractor to execute all works, including excavations, supply of pipes, laying and covering of same, all connections, fountains, valves, hydrants, fittings, plumbing, building, and concrete work, and all materials and workmanship necessary, in full accordance with the maps, plans, specification, and directions of the Town Surveyor, A. B. Ashe, C.E., or the Engineer, Copies of the maps, plans, and specification may be inspected at the Boardroom, Tullamore Workhouse. Contractors shall furnish the names and addresses of two solvent sureties who will enter with the contractor into a bond.

March 2. **WORKINGTON.**—Provision and laying of about 2,900 lineal yards of 18in. diameter stoneware pipe sewer, with sea outfall, consisting of about 714 lineal yards of 18in. diameter cast-iron pipes, supported on timber piling, together with manholes, lampholes, stormwater overflow chambers, and other works, for the Corporation. Drawings may be seen at the offices of H. Bowman Williams, Borough Engineer and Surveyor, Town Hall, Workington, from whom copy of the specification, bill of quantities, and form of tender can be obtained, on deposit of £3 3s. Tenders to be delivered to the Town Hall, addressed to John Warwick, Town Clerk, Workington.

March 3. **HUDDERSFIELD.**—Construction of stoneware and cast-iron pipe sewers in various parts of the Borough, and the installation of a system of sewage disposal works at Bradley. Drawings and specifications, bills of quantities, forms of tender, and other particulars upon application to the Engineer, K. F. Campbell, M.Inst.C.E., M.I.E.E., on deposit of £3 3s. Tenders must be sent to J. Henry Field, Town Clerk, Town Clerk's Office, Town Hall, Huddersfield.

March 7. **BEDLINGTON.**—Construction of the following length of sewer, inclusive of manholes, gullies, connections, and other works, for the U.D.C.—816 yards 12in. glazed earthenware pipe sewer, from 5ft. to 12ft. in depth. Drawings and specifications may be seen, and quantities, form of tender, and all other particulars obtained, by appointment at the office of the Surveyor of the Council, J. E. Johnston, Front Street, Bedlington. Tenders to be sent to Charles D. Forster, Joint Clerk of the District Council, 24, Grainger Street West, Newcastle-on-Tyne.

March 19. **HALIFAX.**—Construction of fourteen percolating filters (8 90ft. and 6 85ft. diameter), at the sewage disposal works, for the Corporation:—22, excavators', masons', and bricklayers' work; 23, cast-iron pipes and sluice valves; 24, distributors (revolving); 25, filtering medium; 26, unloading and filling filtering medium. Plans and specifications may be seen and forms of tender obtained on application to James Lord, M.I.C.E., Borough Engineer, Town Hall, Halifax, upon deposit of £10 for each set of quantities. Tenders must be sent to Herbert Ashling, Town Clerk. Fair wages clause.

March 4. **LONDON (for Malta).**—Supply of stoneware pipes and specials, for the Receiver-General and director of Contracts, Valletta, at whose office tenders will be received. Tenders are to be accompanied with a deposit of £300, to be made in the Office of the Crown Agents by tenderers residing in Great Britain not having a representative in Malta. Particulars, specification, etc., may be obtained on application at this office or to the Crown Agents for the Colonies, Whitehall Gardens, London.

March 14. **STANHOPE.**—Laying 3,160 yards or thereabouts of main sewer and the construction of tanks, filters, and irrigation area for sewage disposal purposes at Stanhope, for the U.D.C. Plans and specifications may be seen and quantities and forms of tenders and other information obtained on application to the Council's Engineer, J. S. Parker, A.M.I.C.E., Post Office Chambers, St. Nicholas Square, Newcastle-on-Tyne, or the Council's Surveyor, J. R. Ridley, Town Hall, Stanhope. Deposit of £1 required. Tenders should be sent to F. H. Thompson, Clerk to the Council, Stanhope.

ROADS AND CARTAGE.

Feb. 28. **PENARTH.**—Supply of road metalling and gravel up to March 31, 1911, for the U.D.C. Forms of tender and further particulars may be obtained on application to Edgar J. Evans, A.M.I.C.E. Surveyor, District Council Offices, to whom tenders are to be sent.

Feb. 28. **PENARTH.**—Execution of private improvement (street) works in West Terrace Lane, for the U.D.C. Plans may be seen and copies of specifications and bills of quantities obtained on application to Edgar J. Evans, A.M.I.C.E., Surveyor, Council Offices, Penarth, to whom tenders are to be sent.

(Continued on next page.)

Fulwell Hydrated Lime.

A high-class Lime, slaked by a patent process, and packed in bags. Saves the labour of washing and running the lime, will not blow, leaves no waste, may be stored without deterioration and without bursting the bags.

For mouldings and lathwork can be gauged with a much smaller proportion of plaster than ordinary lime.

Converts lime into a safe, reliable and convenient material with the advantages of a bagged plaster.

Further Particulars and Samples from:—

The Exors. of the Late
Sir HEDWORTH WILIAMSON, Bart.,
Fulwell Lime Works, SUNDERLAND.

Carbolineum Avenarius

REGD.

Wood Preservative
Antiseptic
and Disinfectant

Undoubtedly the Best Wood Preservative known

Cheaper and more effective than paint.

Invaluable for the protection of Wooden Buildings, Fences, &c.
Gives a nice nut-brown colour.
Horses will not bite wood treated with it.
Has been proved a success for the last twenty years in this Country and is used regularly on many of the largest Estates.

Tenders must be sent to the Clerk of the County Council, Middlesex Guildhall, Westminster.

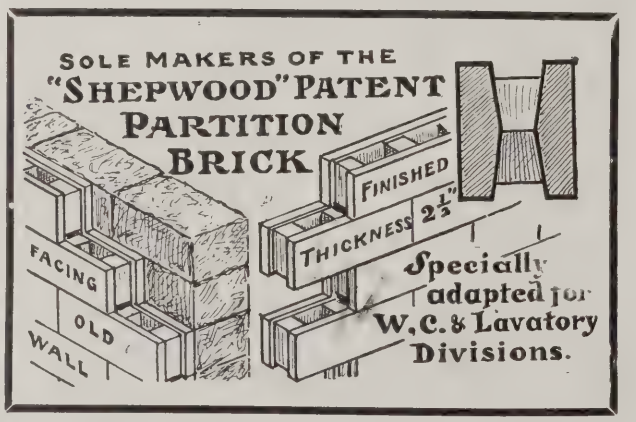
March 30. **HOO (Kent).**—Supply of the following materials to be delivered on the roads, for the R.D.C.:—Broken granite, unbroken Kentish ragstone, unbroken surface picked flints, unbroken pit flints and hoggin, also carting (day work), and steam road rolling and scarifying. Forms of tender may be obtained of Richard Phillott Smyth, Clerk, Strood, Kent.

MISCELLANEOUS.

Feb. 28. **SOUTHEND-ON-SEA.**—Supply of the following articles (among others) for a period of two years from April 1, 1910, for the Corporation:—1, stoneware pipes, bends, etc.; 2, flints, bricks, gravel, etc. 3, timber; 4, ironmongery; 5, paints, oils, and colours; 7, cement, lime, and chalk; 10, tar paving and tar macadam; 11, iron castings; 12, granite kerb and channel; 13, broken Guernsey granite; 14, broken granite; 15, pitch and creosote oil; 18, iron and steel. Forms of tender may be obtained upon application to E. J. Elford, M.I.M.E., Borough Surveyor, Southend-on-Sea. Tenders to be delivered to H. J. Worwood, Town Clerk, Town Clerk's Office, Southend-on-Sea.

Feb. 28. **SALFORD.**—Supply of the following materials, and work to be carried out, between April 1, 1910, and March 31, 1911, for the Corporation:—1, cables; 2, cable accessories; 3, refined Trinidad bitumen; 4, cable conduits, stoneware and fibre pipes, asphalte bridges, etc.; 5, wood troughing, bends, etc.; 6, cement, lime, bricks, etc.; 7, house service cutouts; 8, electricity meters; 9, maximum demand indicators; 10, gravity type ammeters; 11, circuit breakers; 12, soda ash; 13, switches, porcelain cutouts, and arc lamp globes, 14, carbon filament glow lamps; 15, arc lamp carbons and motor carbon brushes; 16, electric motors; 17, motor starters; 18, iron castings; 19, brass and gunmetal castings; 20, iron and steel bars, plates, etc.; 21, ironmongery; 22, wrought-iron tubes and fittings; 23, drysalteries and chemists' sundries; 24, timber; 25, wood fittings; 26, engine-room stores; 27, engine oils; 28, carting; 29, economiser cleaning; 30, removing cinders; 31, purchase and removal of empty casks; 32, window cleaning. Specifications, forms of tender, etc., may be obtained from Victor A. H. M'Cowen, M.I.E.E., the Borough Electrical Engineer, Electricity Works, Frederick Road, Pendleton. A deposit of 10s. is required on 1, 4, 7, 8, 9, 10, 11, 14, 16, and 17. Duplicate copies of any specification will be supplied at a charge of 2s. each. Tenders must be delivered at the offices of the Borough Electrical Engineer.

March 1. **LONDON (for Madras).**—Supplying (1) paints, etc.; (2) miscellaneous tools and stores, for the Madras and Southern Mahratta Railway Company, Limited. The charge for each specification is £1 1s., which will not be returned. Tenders must be sent to H. Bonham Carter, Secretary, 91, York Street, Westminster, S.W.



March 2. **RHONDDA.**—Supply of lime, acid, oxide of iron retorts, and fire-bricks, silica bricks, oils and paints, ironmongery, etc., wrought-iron tubes, gas, water, gun-metal fittings, gas-meters, hauling, books, and stationery, for the year ending March 31, 1911; lead and compo. pipes, for the half-year ending Sept. 30, 1910, for the U.D.C. Forms of tender may be obtained (except those for gas, water, and gun-metal fittings, lead and compo. pipes, books, stationery, and ironmongery, which will only be supplied to those inspecting the samples), on application to Octavius Thomas, Engineer and Manager, Gas and Water Offices, Pentre, Rhondda. Tenders to be sent to Walter P. Nicholas, Clerk to the Council, Public Offices, Pentre, Rhondda. Fair wages clause.

March 3. **SMETHWICK.**—Supply of the undermentioned materials and articles (among others) for the year ending March 31, 1911, for the Corporation:—Broken Clee Hill granite; broken and unbroken Rowley ragstone kerbs, circles, elbows, and setts, steel shovels, and steeled picks, scrapers, mud scoops, digging forks, galvanised sanitary ash bins, all Smethwick pattern; bricks, Staffordshire, brindled and common; scavenging and dandy brushes and pick helves; gully grates, frames, and weirs; manhole and lamphole covers, and cast-iron trunks, all Smethwick pattern; glazed earthenware pipes; cement, best heavy Portland; lime, firewood. Forms of tender may be obtained from C. J. Fox Allin, Borough Surveyor, Council House.

The

Leeds Fireclay Company, Ltd.

Head Office; Wortley, Leeds.

London Offices & Showrooms **2 & 3, Norfolk St., Strand, W.C.**

Also at LIVERPOOL—21, Leeds Street.

HULL—Alfred Gelder Street, South Side, Queen's Dock.
NEWCASTLE—4, Northumberland Street.

SPECIALITY:
"ETERNIT" Terra-cotta Tiles, which neither break nor crumble, and at half the cost of Staffordshire Tiles, double the strength and about one-third of the weight.
Prompt Delivery.
Speedy fixing.
No breakages.

G. R. SPEAKER & Co., ENGINEERS,

Smooth on both sides. Roofs covered with "Eternit" Tiles weigh about 22 lbs. per square yard, or 66⅔ lbs. lighter weight per square yard than Bangor Slates. Greater mechanical and tensile strength. Non-Conducting. Non-Combustible. Impervious to sun, heat, frost and rain. Wind, dust and weather tight.

G. R. SPEAKER & Co., CONTRACTORS,

For enduring roofing material and workmanship,

Architects, Engineers & Surveyors are respectfully recommended to specify

ETERNIT REGISTERED TRADE MARK 1904.

Guaranteed and manufactured under Hatschek's Original Specification and to decline all substitutes. No other roofing tile is "ETERNIT." (Regd.)

WRITE FOR SAMPLES AND FOR TENDERS FOR FIXING.

29, Mincing Lane, E.C.

Branch: 33, VICTORIA ST., BRISTOL.

28, MARK LANE, LONDON, E.C.

Branch: 33, VICTORIA ST., BRISTOL.

GUARANTEED:
Tensile strength, 5,781 lbs.
Crushing force, 8,281 lbs.
Per Square Inch and always increasing with age.
Immunity from repairs.

Architects, Engineers and Surveyors are earnestly warned not to confound 'Eternit' Tiles with so-called Asbestos Slates varying in quality, thickness and colour, advertised under fancy brands. 'Eternit' "endures not for an age, but for all time."

The Town Planning Conference.

On the whole, a refreshingly practical and businesslike tone prevailed at last week's nference of chairmen and vice-airmen of committees, borough ıgineers, and surveyors, called by e National Housing and Town lanning Council to discuss the cost and chnical administration of town planning hemes. The conference, so far as can e seen from reports, resulted in subantial contributions towards a better ıderstanding of the many problems that wait solution. Mr. Henry R. Aldridge ıbmitted a report on the cost of townanning schemes in Germany, from which appears that the cost of preparing a heme—exclusive of surveying—is about .. per acre of land dealt with in the town-ctension plan; while the cost of the general idea" plan is from 2s. to 2s. 6d. er acre. Members of the Incorporated ssociation of Property Owners will probably learn with dismay that German town ouncils are safeguarded by the Act of 875 against claims for compensation for nd and cost of road-making so long as ıe road does not exceed 85ft. in width; nd they will possibly be amazed, and erhaps incredulous, when told that while ll cases in which this width is exceeded re dealt with on their merits, the municipal authorities are in most cases successful in inducing the owners to give the dditional land and to pay the cost of xtra road-making. Landowners in the nited States, it is well known, are milarly tractable, partly because of the ervasiveness there of "town pride" and ublic spirit, and partly (and perhaps more otently) on the principle of pruning the ree to make it more fruitful, the value of ıe land given up being as nothing in comarison with the consequent increment on djacent property. Mr. Aldridge further ointed out that German local authorities ossess the power to re-plan areas that are lready built upon, whereas in our own ountry all planning schemes must deal ith virgin land. It is perhaps the small wners who make most fuss; for Mr. A. R. tenning, of the Surveyors' Institution, was o doubt amply justified in his statement hat architects who are advising big landwners, know that these are "only too illing and anxious to make proper housng schemes." The conference dealt argely, if not chiefly, with the question of he width of roads; and one important esolution under this head was to ask the ocal Government Board whether under a town-planning scheme the local authority would have power to make the roads shown on the plan when it wished to do so, and collect the cost from the owners either when the road was made or when the land was built upon, and also whether the cost of the road could be charged on the owners of all the property it served or only on the owners of the frontages. It is to be hoped that the answer to these very pertinent questions may afford comfort and relief to certain owners who, under the old system, have been subjected to grievous hardships; as where, for instance, the builder of a row of houses opposite a suburban park found that he had to pay for the paving not only of the footpath in front of his houses, but for that on the other side of the road, next the park fence; or where a few owners living near a large church found that they had to pay for the very considerable stretch of paving in front of that church; or where the guileless purchaser of a new corner house finds that his apportionment for paving is twice or thrice that demanded from each of his neighbours. A further sensible observation was made by Mr. E. T. Hall, who, criticising a resolution dealing with the limitation of the number of houses per acre, remarked that the Dulwich College Estates Governors had set apart 160 acres of land out of two square miles for playing fields; and that whereas the resolution would mean that each individual acre of land must only have a certain number of houses, the way to lay out a big scheme was surely to consider it as a whole, and to have a number of oases rather than to deal with each particular acre. Apart from the merits of the particular resolution under notice, Mr. Hall's way of looking at the question commends itself by its breadth. Town planning, like Nature, should be seen steadily and whole. We must acquire the habit of thinking in acres rather than in yards, and perhaps in miles rather than in acres. There must be no pottering paltriness.

"The Lowest or Any Tender Not Necessarily Accepted."

This is one form of a formula used in connection with most enquiries for tenders. Its object is obviously to preserve, up to the actual signing of contract, the freedom of action of the parties who invite tenders. If we remember rightly, its omission on one occasion led to litigation, with the result that the Court ruled that those who had invited the tenders without this qualification were under obligation to accept and carry out the lowest. This is only the correlative to the fact that a tender sent in without qualification of a relatively similar kind becomes by mere acceptance a binding contract. Hence the practice of adding to the form of tender a proviso that mere acceptance shall not constitute a contract. Contractors, however, often express themselves strongly as to the way in which the freedom thus reserved is used. When tenders are invited from selected contractors, the object is, ostensibly at least, to obtain the lowest bid for the work; and the reasonable inference and expectation is, that the lowest tender will be accepted if the work is gone on with. Therefore those who tender exercise their utmost ingenuity in order to arrive at prices which will bring out the lowest tender; in the process much time is spent and much experience brought to bear. It is, and must be, very galling therefore to such to find, as sometimes happens even to firms of high repute, that although they have come out lowest in the competition, a tender at a higher rate has been preferred. Under these circumstances contractors naturally infer that either the architect or engineer has advised his clients that the work cannot be properly done below a certain figure; or, that the firm quoting the lowest price is objectionable or incompetent in some way or financially inadequate to the work; or, that the job was intended from the first to go to a certain firm, and the tenders of others were invited merely as a check. Probably the last-named inference is the one most generally made, and is the one which excites anger. It will be at once admitted that a client is well within his rights in rejecting a tender which his professional adviser says is too low; indeed, a contractor is thereby saved from the consequences of his own error of judgment. Financial inadequacy or incompetence on the part of a contractor are generally sound reasons for rejection. Contractors, however, rightly think that the two latter matters should be considered beforehand, and that the mere fact that they have been asked to tender implies that they are deemed competent both financially and otherwise, and therefore that the lowest tender of those invited should be invariably accepted, unless the professional adviser is clear that the price quoted is too low. There can of course be no two opinions about the unfairness of inviting tenders from a number of firms merely as a check price on some favoured firm, to whom the work is to be given if their price is anywhere near the mark. If the fact

becomes known, and it often does, that a certain firm is to be preferred, the competition tends to become a farce played at the expense of its promoters. The better way is to accept the verdict of a competent surveyor on prices quoted by a preferred firm by way of testing their fairness. Some rather startling figures were recently given by a correspondent as to the expense of architectural competitions, and these could be easily paralleled by builders who compete freely for work. In view of these considerations it has been suggested that the formula "the lowest or any tender not necessarily accepted," or, as it is oftener put, "the proprietor does not bind himself to accept the lowest or any tender," should have the words "the lowest or" omitted when the tenders are to be invited from selected contractors, the object being to secure an implied right to acceptance by the firm quoting the lowest price. This would make it difficult, however, for an architect or engineer to exercise his discretion in advising his client as to whether the lowest price was an adequate price, which is a serious objection. The words "does not bind himself to accept the lowest or any tender" seem to imply that lowness of price is not to be the determining factor, but that consideration will be given to the adequacy of the price quoted for the result expected. If all tenders were loyally settled on such a principle, there would be scant grounds for objection. The difficulty is that there is no criterion by which either side can test a decision before the event. It has been suggested that a fair price would automatically result from accepting, not the lowest tender, but the tender which approximated most nearly, on the lower side, to the mean price of the various tenders received. If announced in conditions of tendering, this method would probably eliminate most of the objections to the present system, and tend to make contractors quote a carefully considered price, because the temptation to resort to price cutting would no longer be the dominating factor it is now, and this offers perhaps the best solution of the difficulty in the case of a selected competition. When we turn to open tendering, however, each of the considerations to which we have referred has to be reckoned with after the tenders are in, and it becomes necessary that the advice of the professional advisers engaged in the matter should be listened to, when they advise the rejection of certain tenders on good and substantial grounds, even though those rejected are among the lowest. As to the morality of inviting tenders with no real intention of proceeding with the work, it stands self-condemned, and in the case of works where the cost of plans and quantities falls upon those who invite tenders, there is an obvious check on the indulgence of such fancies; this is unfortunately no longer the case where the cost of designs or plans and quantities falls on those who provide the tenders, and much wasteful expenditure is forced on decorators, upholsterers, and the smaller builders by the whims of clients. Into this category of wasteful expenditure imposed on architects and builders must be put those expenses of tendering in competition to which reference has been made, and to which before long an end should be put, by placing them on the shoulders of those at whose instigation they are incurred.

The success of the new and improved series of the "Architectural Review" (with which is incorporated "Details") has been so great that the January and February issues ran out of print shortly after publication.

TONE AND COLOUR IN TOWNS.*

By Professor S. D. Adshead, F.R.I.B.A.

Style and Character.

Colour, texture, and form are the three qualities through which we see style and character in the architecture of the town. Of these, colour and texture are the most abstract. Unlike form, they have but limited possibilities for graphic or hieroglyphic representation. Form appeals to us both through the understanding and through the imagination, but colour through the imagination alone. Form carries with it information. It suggests an association of concrete ideas; but colour appeals direct to the emotions alone.

The colour of a town, therefore, is a matter of greater æsthetic importance than that of form. Texture is a quality very closely allied to colour, more so perhaps than form, and the combination of colour and texture give us that quality which we may describe as tone.

Before proceeding further, it is necessary that we recognise that form, colour, and texture are only appreciable through the medium of light, and that the quality of the light is dependent upon those atmospheric conditions through which it is diffused.

Variation in atmospheric condition is very great, and apart from the question of smoke, humidity has an important influence on the quality of the light. Smoke and humidity I regard as atmospheric texture, and in combination with light, they give us tone. The more northerly the climate, the more humid will be the atmosphere, the lower the rays of the sun, and the greater the influence of tone on the colour of the town. On the other hand, the dryer and clearer the atmosphere, and the higher the sun, of less importance is atmospheric influence in diffusing tone and colour over the town. It may be safely said that in Italy and Greece, so clear is the atmosphere and so brilliant the sun, that the soffits of cornices, ceilings and of porticoes are brilliantly illuminated from the sunlit pavements below during at least half the days of every year, and perhaps during a longer period than this.

In London, on an average, there is only one week in the year when the sun is sufficiently high in the sky, and the atmosphere sufficiently clear and dry for effects like this to be seen. Even when the sky is perfectly clear, usually the sun is too low in this country to throw up reflection from the pavement in the same way. In calculating therefore what are the average conditions of light in a country situated like ours, although we may reckon upon being favoured with a certain measure direct from the sun, it does not come to us with that dazzling brilliancy with which it shines in countries which are further south; but peeping from between the clouds and illuminating the city with a bright spot here, at the same time casting a shadow there, it comes in uncertain moods. Or else low in the horizon it will cast a golden tinge over the whole town, which, however, more often than not presents a monotonous grey.

But although not favouring those of us who dwell in these northern climes with a superabundance of sun, Nature in other ways is particularly kind. With her many surprises, her serene sunrises, her sunsets, her grey dawns, her storm clouds, her rain clouds, and her harvest moons, she blends together all the heterogeneous and primary colourings of man, certainly with greater profusion than in the sunny south. But we must not trespass too much on her kindly light; we must not depend too entirely on her harmonising powers. There are times when she is in no particular mood, times when her blatant efforts are engaged simply in research, times when she is so bald, so clear, so cold, that of help for the poor efforts of man spent in bringing into relation the colour effects of a town, she has none.

*A paper read before the Birmingham Architectural Association.

Great, therefore, as is the natural influence of light on the colour effect of a town, it is not enough. The colour of the city is very dependent on man; Nature can do no more than take man's work and upon this diffuse a scheme of light, which after all is but a separate harmony in itself.

Smoke-grimed Towns.

And here before proceeding further, we come up against the distressing question of how to get colour in the architecture of towns which are diffused with smoke. In my opinion, smoke is a thing to be avoided at all times and at any cost. When so pernicious as we find it in Manchester and Leeds to have colour in the architecture is absolutely impossible. These cities are doomed to a perpetual gloom. Out of consideration for the moral and intellectual welfare of the inhabitants of a city, to say nothing of their physical health, no expense is too great which will eradicate the evil influence of smoke. My objection to smoke and its evil effect on a town is not altogether because it takes the life out of everything with which it comes in contact, but it is so self-assertive in its omnipotent rule. With its permeating powers it throws over a city a perpetual funeral pall. At times it mingles with the clouds, and, like an ominous billow or pillar of fire, hangs over a city with terrible effect. It is ominous to behold. It is an ogre risen up from a terrible inferno created by man; it is a sign that man by his works is a slave unto himself. True, a little smoke over a city may at times have a softening and subduing effect, and possibly in a limited sense gives tone to the buildings where it alights. Doubtless this would be the view held by many who, quite justly, call themselves artists, and take a distinctly humanitarian view. It is the view of those whose sympathies incline more towards the weaknesses of human nature than to its strength. The poet Shelley, when writing of the capital of the nether world, wrote:—

"A city much like London,
A prosperous and smoky city."

The point is, smoke is not an essential attribute of human existence, it is only one of those burdens which human nature in its weakness has chosen to carry. You architects who are interested in tone and colour should spare no pains in endeavouring to eradicate smoke from the towns.

In the chief cities of America, New York, Milwaukee, Toronto, Toledo, Indianapolis, Detroit, the district of Columbia, and numerous other towns, laws have been passed making the emission of black or dark grey smoke an act punishable by fine. A similar law exists over here, but it is not enforced. In America to ensure the enforcement of the law in some cities a section of the Health Department is set aside for the work, and in others there is a special smoke abatement committee with an executive of inspectors and officers under their charge.

In any case, I suggest that every town should have an army of inspectors whose duties should be regarded as equal in importance to that of the police. It would be out of place for me to enter into a consideration of the numerous devices that exist for the prevention of smoke. Undoubtedly much can be done. Fortunately we have seen the worst of the age of coal: electricity for haulage, for heating and lighting, is slowly but surely making headway on every hand.

One word more on the effect of smoke on the materials which compose the town. In northern and humid towns the smoke particles which collect in the atmosphere, being moistened, adhere wheresoever they touch. In dryer climates they fall as dust, and are either blown about until finally they get washed down the sewers or else are carried right away. So that here the problem is more serious than in Rome, in Paris, or even in London. My own explanation of the superior cleanliness of these towns over such towns as Manchester, Glasgow, and Edinburgh is not that in the former less

smoke is emitted but that the climate being dryer it does not adhere to the buildings to the same extent. What then can we do to prevent its appalling effect? Apart from preventative measures we can use those materials which either marry with it or are affected less by its pernicious influence than others. We must recollect that we are treating a disease which penetrated into every port. We can if we choose use materials like Portland stone and sand-faced bricks which with limitations have a way of taking on interesting tones without allowing themselves to be overwhelmed. Or we may use glazed surfaces, which so long as they are constantly washed certainly resist its worst effect; but in using such materials other considerations must be taken into account, and we will deal with these later on.

Initial Colouring.

Turning then to the initial colouring of the town as it appeals to us independently of external atmospheric conditions, and depending entirely as it often does on the choice of the materials used—what are the principles which should guide us in our colour scheme? I submit that in the first place the colour of the town must be in sympathy with the atmospheric conditions that prevail, as to key. In a human atmosphere and a northern clime the keynote of our colour must be low, and conversely where dazzling and brilliant atmospheric conditions prevail we may compose our colour scheme in the highest key. It is common knowledge that as we advance towards the north, colour disappears. On the other hand, in Central Africa, Australia, South America, and the Tropics, the scene is everywhere bedecked with flowers, ornamented with birds and butterflies, and bespangled with blues, yellows and crimsons in their highest keys; colours such as we in our temperate climate can ill comprehend. I submit that these effects are not for us; that we have a scheme of colour to work in, if not so high in key, so brilliant, so dazzling, so pure, or so suggestive of vitality in its highest flight, at any rate a scheme full of individual strength not comparable on terms of intrinsic worth with any other; but equally essential and possessing a reserved beauty and charm which are entirely its own. I hold that the artist who is called in to paint a panel in which is essentially a low-toned room, will, if true to his convictions, decorate it in a low-toned way.

It is right that Edinburgh should be grey, and it is right that Algiers should be white. Leaving the question of key of colour, let us turn to texture, and we see that the same principles hold good.

In a dull and moist atmosphere coarse grained materials, grainte, freestone, and sand-faced bricks are those which are in sympathy with the natural conditions around. On the other hand those vitreous materials, mosaic, faience, clay, brick and tile are only well and sympathetically used where the atmosphere is clear and dry, and where the sun is dazzling in the sky. It is a matter for practical consideration whether we use materials the colour and texture of which are seen at their best during one week in June or whether such as accord with our fleeting sunlight or our monotonous grey. Our appreciation of the importance of using materials which will soften with vegetation and tone down in weathering must influence us in deciding this. Those materials which adapt themselves most readily, which take on the local colour in the most natural way are the ones we should regard as being the most suitable to use, and it will be found that such have necessarily a fine texture and a surface which is absorbent to a considerable degree. Now, such materials may not always be the most suitable to receive the dazzling light of an exceptional July day; but rather than build in polished foreign marble, than cover the surfaces of our buildings with gorgeous mosaic, than line our streets with cream faience and other materials glazed to resist the local colour which everywhere softens the work of man and so live in an Elysium for one week in the year, let us use those materials, Portland stone, local freestone, and sand faced bricks, which welcome rather than resist the softening work of time, and let us feel that we are living in the climate in which we are born.

Having regard to cost, the choice of materials which we architects have to-day at our command is greater than ever it was before. We have facilities for using materials brought from distant parts in a way previously unknown. The distance from which material is brought appears to-day to have very little influence on the cost. Consider in connection with this the fact that all our important towns have increased to such an extent that the question of using local materials only, so as to harmonise with the natural appearance of the scenery around, is not a matter of such importance as in the past. The natural resources and effect of the site being practically obliterated in our big towns. There are exceptions, and Edinburgh is a case in point, but speaking generally, I am not one of those who would debar the use of all materials except such as were to be found in the locality around. Our towns are more artificial than they were in the past, and it is necessary that they be so. The need for using local colour is æsthetically speaking not so important to-day as when our cities were mere villages, and exotic materials intruded upon the actual scenery around. I have, therefore, no objection to the use of exotic materials merely on the ground that they are not locally found. The choice of materials should to my mind, so far as appearances are concerned, be one entirely of sympathy with the atmospheric conditions which prevail. I think I have made it clear that I strongly disapprove of the use of any material in this country, the texture and surface of which will not take on the weathering or vegetate in the way that is natural to the climate in which we live. I therefore denounce in the strongest terms these so-called glazed terra-cottas, and every material which has a surface that is adamant or glazed.

In doing so I am aware that I may be treading on tender ground. I admit that I can conceive of a street built entirely of this glazed ware, canopied with a sky of the deepest blue, absolutely clean and free from the pernicious effects of smoke, glistening under a sun with the temperature of 80 degrees in the shade. I can imagine the glistening asphalted pavement and the brilliantly-dressed crowd. I say that with such conditions a street of glazed ware with its ivory tinge would be everything that one could desire; but how often do such conditions prevail? Where in England is the town absolutely free from dirt, that can boast of ten or even thirty such days in the year and what of the odd 335, one-half of which are cold and grey and drizzling with rain? What of the glazed ware, then, with its exotic effect, its chill and icy glaze, its soot begrimed and greasy face clamouring to be washed, its blackened joints more repellent each time that it is washed. I prefer the workmen's dirty corduroy to the gentlemen's greasy shirt. My disapproval of glazed ware I extend to glazed bricks, clay bricks and terra cotta, too. Hard as adamant their resistance to our atmospheric conditions is repellent and unsympathetic; and of weathering and vegetation they will have none. In colour, the

By P. Scott.

COMPOSITION IN THE ORDERS, LIVERPOOL SCHOOL OF ARCHITECTURE

(*See also page* 168 *and Centre Plate*).

pink terra cotta and the clay brick is vicious and destructive of all breadth and softness of effect.

What then are the materials which we are to use? In the first place I would name Portland stone. This noble material, its natural colour varying from a beautiful grey to a rich brown, is in a low tone colour scheme the most beautiful that can be obtained. Where unprotected it bleaches to a beautiful white, and under the protecting influences of its cornices its shadows deepen with the secreting effects of time in a way which emphasises its powers of resistance and its form. Washed down with the rain, it takes on a surface the colour of which may vary from grey, or blue to green.

Of other stones, we have Bath. Though less durable than Portland, it weathers and takes on colour almost equally well. It is not a suitable stone to use in a smoky town, as unlike Portland it has not the power of resistance, and does not crystallise on its surface under the influence of rain so as to resist the smoke. Of other stones, we have those of a creamy tone, such as Darby Dale, Ketton, and many from York. They are sympathetic to the touch of our humid atmosphere, but unfortunately, unlike Portland, incapable of resisting smoke. Brown stones, like Ham Hill, must take a second place; they usually look well amidst their local surroundings, but in a town they are too dead. Of red stone, such as Runcorn stone, of which the Liverpool Cathedral is being built, the same remarks generally apply, though used as it is there, rising up from amongst the trees and isolated from everything else, it has a beauty which is entirely its own. Catching the sunlight as I have seen it, its soft golden brown colour strikes a note of endurance and solid grandeur, which a lighter stone in this position could not conceivably attain.

Speaking generally, stones which are either grey or cream, have the most beautiful effect in a town. Granite is a material which we must not forget. Cheapness in freight and improved methods in working have caused it to become almost as economical a building material as Portland stone. Norwegian granite is used more and more every day, and its use is likely to increase. When clean from the saw, it has an appearance of strength, refinement, endurance and precision, which gives it an exceptional value. It weathers to a greeny grey, and for the lower storeys and for the more staid buildings of a town, its use is unquestionably to be commended. Then, of bricks, we have the Berkshire, the Sussex, the Kent, and others from Leicestershire, all of which are sand-faced, the usual London stock and others of the commoner kind, such as have a surface which is not pressed, and which have very little silica in their compound. All these are sympathetic to the weather and the climatic conditions of Great Britain. Of materials of the more economic kind, but which at the same time have an æsthetic worth, I must not omit to mention Portland cement; for Portland cement I have the very greatest respect. Constructively its value is as yet but partially revealed, and its use as a decorative medium has yet to be revived. When fresh and clean, it has a beautiful texture, and a colour very similar to Portland stone. Unfortunately, however, it takes on with time a dilapidated hue. It is essentially a material to be coloured. As a decorative material for internal use, it can be treated, and has come to be known as "stuc." An excellent example of what can be done with it in this way is to be seen in the interior of the Ritz Hotel, London. Used externally, it should be distempered or painted, and here we come to the question of paint. In my opinion, we are in this country very reticent in our use of paint; we paint for preservation, but not for effect. We have a limited appreciation of the use of white, and we know something of the use of dark green and brown, but such colour as sage green, grey, or cafe-au-lait to us are quite unknown. Nothing is more distinctive in the secondary street of Paris and other Continental towns than the use they make, especially in their shop-fronts, of these delicate tints.

Application of Materials.

I have mentioned materials and their colour in detail, but after all what is of most importance is their general effect in the town, and in considering the colour effect of a town we must take into consideration not only the façades of the buildings, the colour and texture of the pavements, and the trees, but also the lamp standards, the vehicles, and human throng. We must recollect that the buildings are but a background to the moving crowd, and that architecture at its best does not call for attention, but is subconsciously felt. To my mind the finest type of street, the street which has the dignity fitting a great town, would be built of stone, or under any circumstances of a material which was white, or which had a creamy hue. Its pavement would be smooth, and for its colour it would rely upon its furnishings, its sunblinds, and the crowd. A parasol, a pillar box, or a floating banner would supply its topmost note. Such should be the colour effect of the streets in our most important towns. To my mind, Regent Street, London, owes its claim to be the most fashionable of shopping streets entirely to the delicately coloured stucco of its facades. But what of brick? Brick ought never to be considered as a material suitable to the most important streets of towns. The satisfactory use of brick demands for its background an abundance of green. The orange-red bricks to which I have directed your attention supply a beautiful material for use in the suburbs and possibly in a secondary provincial town. But red is a colour which should be used with the very greatest care. We are far too indiscriminate in the way in which we spread it about. Personally I should like to see greater care in the use of tiles. A tile roof especially that which is coloured a golden, chalky red is perfectly good with bricks, but used with stone, I feel it is out of place. We should hesitate less in our use of slates. Purple slates are to be condemned, but such as are of a soft blue, green, and grey or a velvety black supply a note of endurance where such is required in a colour effect. I have used such black slates from France on a cement front, coloured a creamy white, with excellent result.

I have said nothing of the effect of trees. As a background to architecture, they form a most magnificent foil, in colour and texture, as well as in form. The planting of trees in a town is a lost art. To indiscriminately dot them at intervals along every street shows but a limited appreciation of their real use. To plant a tree in a narrow and smoke-begrimed street, where at best it can but struggle through a short-lived career, rather excites pity than suggests a joy of life. Unless one can look upon a tree as a glory unto itself, it is better by far that it be not there. So I would say to those who propose planting trees in filthy streets, first clean your streets and then plant your trees. But if trees are to be planted where they have little chance of a natural growth, then let them be put out in tubs and boxes, carefully tended, and when they appear to suffer, let them be removed. In planting trees in avenues, there should be some possibility of one day enjoying the shade of an avenue worthy the name. If in masses they should have goodly shapes. Under no circumstances should they obstruct an important architectural view, and in connection with architecture, their right place is in the background. Growing under healthy conditions, trees and fountains are the most healthful and beautiful furnishings for a town.

In conclusion, let me impress upon you the importance of getting rid of our smoke; trees will then thrive, and we can rely upon delicate tints. Let us root our pink terra cotta and all those pernicious colours and adamant materials which are so destructive to greatness and breadth of effect in a town. Like Paris and eighteenth century London, let the tendency in the future be to make our streets lighter in tone, harder in texture, and more delicate in colouring. Thus they will be the fitting background for modern city life which pulsates with a vivacity and energy previously unknown.

Carpenters' Hall Lectures.

NATIVE CRAFTSMANSHIP IN TIMBER, BRICK, AND STONE BEFORE THE 18th CENTURY.

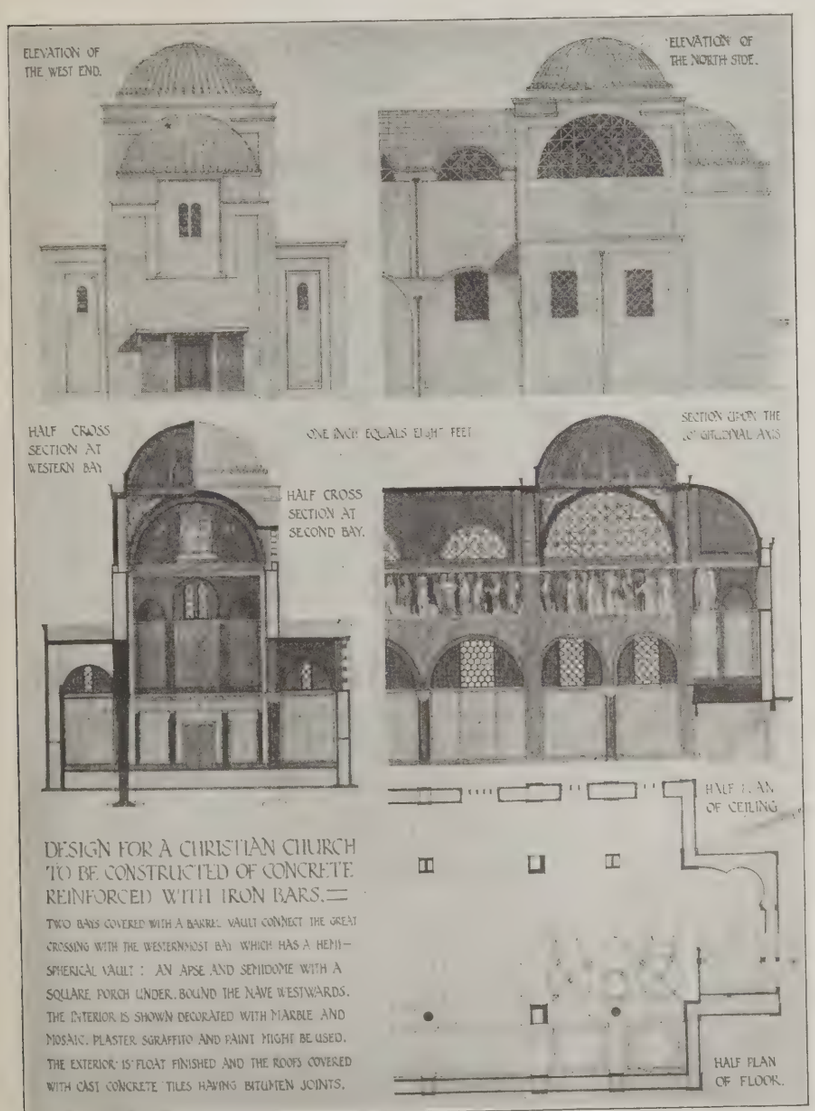
Mr. Arthur Stratton lectured on the above subject on Wednesday, February 9th, at the Carpenters' Hall. I would speak to you tonight, he said, about house-building as opposed to church building. In the mediæval times the craftsman found the best outlet for his genius in the decoration of churches, but more opportunity was found later on in the decoration of houses, and the man who built the church in all probability built the mansion close by. It was not until the wonderful enthusiasm for church building died down that the craftsmen devoted the whole of his skill to house building. This occurred at the time of the suppression of the monasteries. All through the time when native craftsmen were producing their best work, we find them using local materials. Where good building stone could be quarried in abundance, we seldom come across a homestead that has not stone walls, stone mullioned windows, and stone slates. The craftsman seems to have been dominated by a desire to build beautifully and well.

Timber Buildings.

I will only deal briefly with timber forms, on account of other lectures which you have heard on the subject. The Guest House at Lingfield, is representative of the small type of yeoman's house, peculiar to the Wealds of Kent and Sussex. The projection which can be obtained in half-timbered work calls for an endless variety of treatment, and a house from Worcestershire very clearly showed how this could be carried out.

Brickwork.

Brick was for long held in little repute, but later on came to be relied on for splendid and great undertakings. It was generally used in conjunction with stone. Except in districts where stone is very scarce, we seldom, indeed, find brickwork exclusively used. One of the finest examples is Compton Wynyates in Warwickshire. This house being in a district where all three materials abound, there all are used, and the colours blend admirably. The walls are of red brick, five courses to the foot, and with the wide mortar joints which give the texture which we always find in old work. The bricks used vary considerably in size from 12in. by 6in. by 3in. to 9in. by 4½in. by 1½in. Where a large unbroken surface of stone walling would be satisfactory a large surface of brickwork is apt to be monotonous. It wants projections and recesses to give light and shade. Where these can not be obtained, that is, when it was not desired to break the wall surfaces with projections, variety in the surface is sometimes obtained by using patterns in the brickwork. In burning bricks, some are more burnt than others. These vitrified and darker coloured bricks were at first looked upon as defective, but when this was found not to be the case, the craftsmen commenced to use them as a form of colour decoration. The variety of patterns evolved is very great, but the earlier ones were simpler and usually consisted of bricks crossed in diagonal lines, to form a diaper, built of headers, so as not to interrupt the English bond. In no case was the same pattern carried over the same surface. Several instances of simple types in the country were shown, including Eastbury House, near Barking, where little wall surface exists, the walls being broken up



by mullioned windows; consequently where patterns are used they are whole patterns, and these only with great reserve. At Layer Marney Towers, in Essex, the stable wing is a fine example of pure native workmanship, in a house better known as exhibiting terra-cotta work in a manner seldom known in this country. Here the patterns, although running over the greater part of the surface, all vary. Eastbury, near Barking, is one of the best brick houses near at hand; mullions, copings, pinnacles, etc., are all carried out in the same material, though in some cases, unfortunately, the brickwork has been covered with cement. Another method of obtaining variety in treatment can be seen in the gateway to Little Leez Priory, in Essex. Here the octagonal towers are finished at the top with trefoiled headed corbel courses in brickwork; at Leez Priory the sides of the octagon measure 4ft. 7ins., the panels 3ft. 6ins., recessed 4ins., and the corbel course projects 4ins. Another example of a gateway with similarly recessed panels exists at Hadleigh, in Suffolk. The cusped heads of this decorative corbelling, though formed of larger pieces of material than the ordinary brickwork, were yet of the same colour and texture as the ordinary brick. These were apparently shaped first and then fired, not cut out of the brickwork afterwards. There is an unusually fine decorative example of this corbelling on the gatehouse at Rye House, on the borders of Essex and Herts, while at Nether Hall, a few miles away, the corbelling is used without recessing the panels, and is also used more sparingly. There is nothing in which the skill of the brickbuilder seems to show to greater advantage than in the chimney stacks, which run up above the parapets of these gatehouses and other buildings, and usually decorated with spiral or zigzag moulding carried out in cut brickwork. The angles are decorated with projections at the top to give a crisp outline. Examples were shown from Compton Wynyates, Haddington, in Worcestershire, and Gifford's Hall, in Suffolk. Haddington also shows another use of brickwork for nogging or filling between timber work. A house in Wiltshire is a unique example of stone filling with wooden uprights; much of the timber is now decayed. At Stockton Manor House, in Wiltshire, flint being found on the site is used in alternating courses with the stonework.

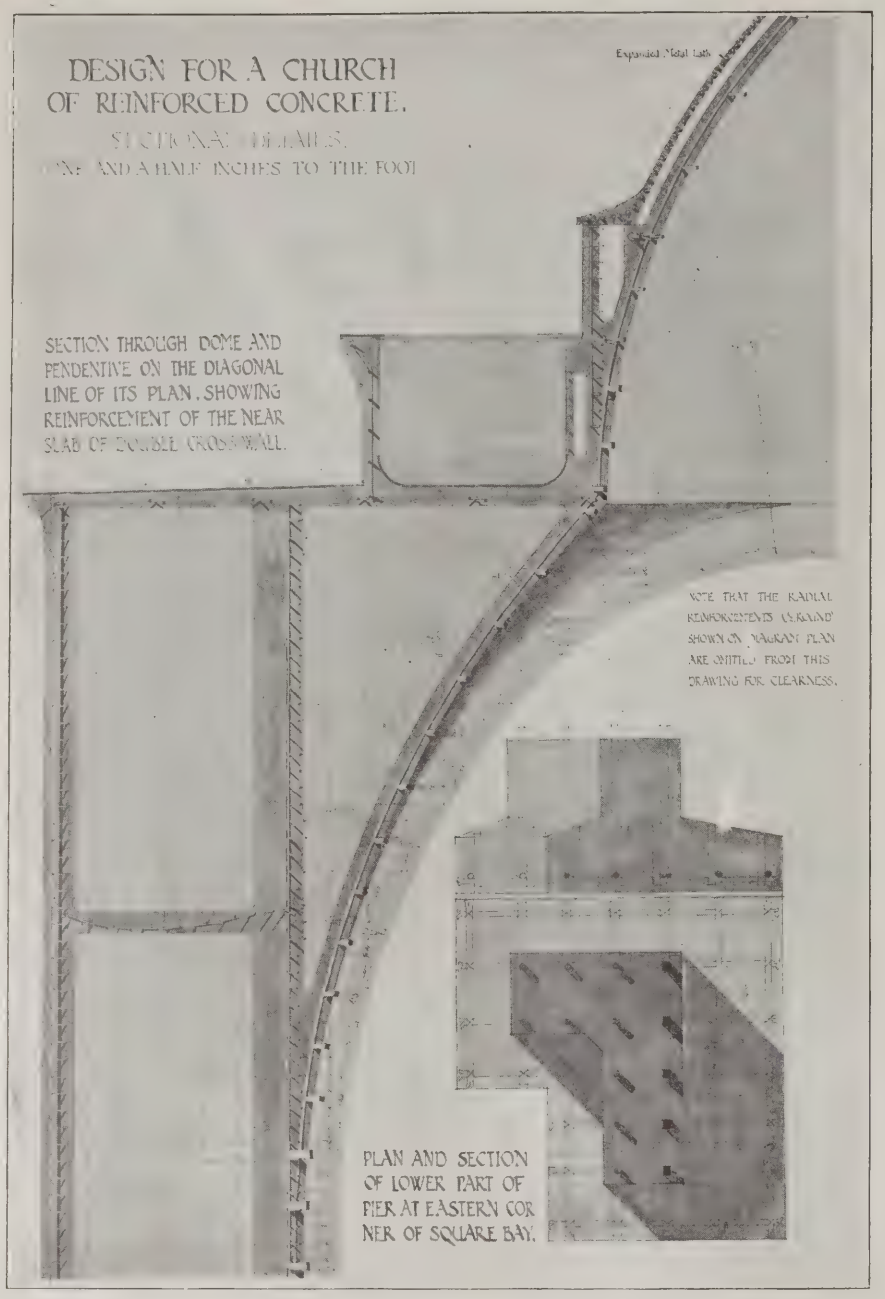
Thornbury Castle, in Gloucestershire, is a magnificent stone-built house, but brickwork was introduced by the builder for a chimney-stack. It was no uncommon thing to find red brick stacks on stone houses, and the contrast is a pleasant one.

Stonework.

Stone, as the larger material, has always suggested greater breadth of treatment. Where difference of colour in the stonework can be obtained, advantage was taken of it, as at the Abbot's Dwelling, Somerset, where the dressed work, mullions, quoins, buttresses, etc., are in darker Ham Hill stone. Though the walling generally may be rough, all wrought work should be carried out with thought and care. There are few buildings more completely suggestive and indicative of the best period of native craftsmenship than Great Chalfield, in Wiltshire. Whenever Ham Hill stone could be obtained, we find ashlar walling in large blocks with small joints. No one knew better than the old craftsmen that this could be relied on to tell its own tale. In Barrington Court, one of the noblest examples, one seeks in vain for sculptured ornament, yet there is a beauty and dignity about it beyond words. In these quiet stone buildings much depends upon the section of the mullions and their position as regards the wall faces, for their effect. The lecturer then briefly described the various sections of mullions obtaining in different parts of the country. They were seldom, he said, set back from the wall face less than 2½ins. or more than 6ins.

The bay windows and oriels were at that time singled out for ornamentation in stone, and even in brick buildings this part was almost exclusively in stone. A very favourite position for these oriel windows was over the entrance porch or gateway. Some very beautiful examples were shown, including those from Hengrave Hall, Suffolk, and Montacute House. In conclusion, Mr. Stratton said that if we would throw off the trammels of the to-day in a desire to do better work, we could not do better than to look to the work of these craftsmen, for there may be found many of the secrets which make for beautiful buildings.

THE GRISSELL GOLD MEDAL. DESIGN FOR A REINFORCED CONCRETE CHURCH BY C. P. WALGATE.



THE ART OF THE LEAD WORKER.

Mr. Lawrence Weaver lectured on the above subject at the Carpenters' Hall, on Wednesday, February 16th.

In choosing the title of "The Art of the Lead Worker," he said, I wish to differentiate from the subject matter of a lecture given last year by Mr. Troup, and which I think might have been called "The Practise of the Lead Worker." I shall not deal to-night with sanitary plumbing. In an old book, the lecturer continued, he had found the following definition:—"Plumbery: art belonging to architecture, being the art of working in lead." The real artist in leadwork should not be ashamed to write himself down as "artisan." The word "mechanic" carries with it the idea of work mechanically done, so the word artisan should carry with it the idea of work artistically done. The uses of lead in the past were very important, and differ very much in character, and I shall confine my slides and remarks to-night to English leadwork. It is one of the things always said against lead, that it is a poor relation to other materials. Many people think that things made in lead would have looked better in bronze or other material, but I show you otherwise to-night. You can get in lead a delicacy in modelling which you cannot get in any other material. There are some things which can be equally well made in lead as in bronze, such as statues—a statue made in lead is very much cheaper than one made in bronze. Lead is not a material for use in the "grand manner," but is a homely material. If lead were always used in the right place, it would not be accused of being the wrong material. Some things cannot be made of anything but lead. Rainwater pipes and heads are made in cast iron. I have nothing to say against them, if they must be cheap, but lead should be used if the work is to stand. I am not here to talk so much as to show, so will now start with the slides.

Church Fonts.

There are 30 lead fonts in England dating from the 12th century to the 17th century late Renaissance. The nearest one to London is at Walton-on-Hill, and is arcaded in 12 compartments, containing a figure in each, representing the 12 apostles.

THE GRISSELL GOLD MEDAL. DESIGN FOR A REINFORCED CONCRETE CHURCH BY C. P. WALGATE.

Another, at Ashover, in Derbyshire, is cast in thin sheets and filled round the stone, this also has a arcaded treatment filled with figures of the apostles or saints. An example from Brookland, Romney Marsh, was, the lecturer remarked, the most interesting font in lead, or, indeed, any other material, in England. This was arcaded in two tiers, the upper panels filled with the signs of the Zodiac, and the lower ones with various symbolical groups. In Gloucestershire there are six fonts all cast from the same pattern, so one may count it reasonable to suppose that when they were originally cast, in about the 12th century, there were at least 24 of them, so that, given a good design, a stock pattern is not a bad thing in itself. If you get a really good piece of sound, honest, artistic work, there is no harm in reduplicating it. Several others were shown including one from Brundall in Norfolk, and Parham in Sussex, illustrating the gradual disappearance of the arcaded treatment, which was finally abandoned altogether.

Rain Water Heads.

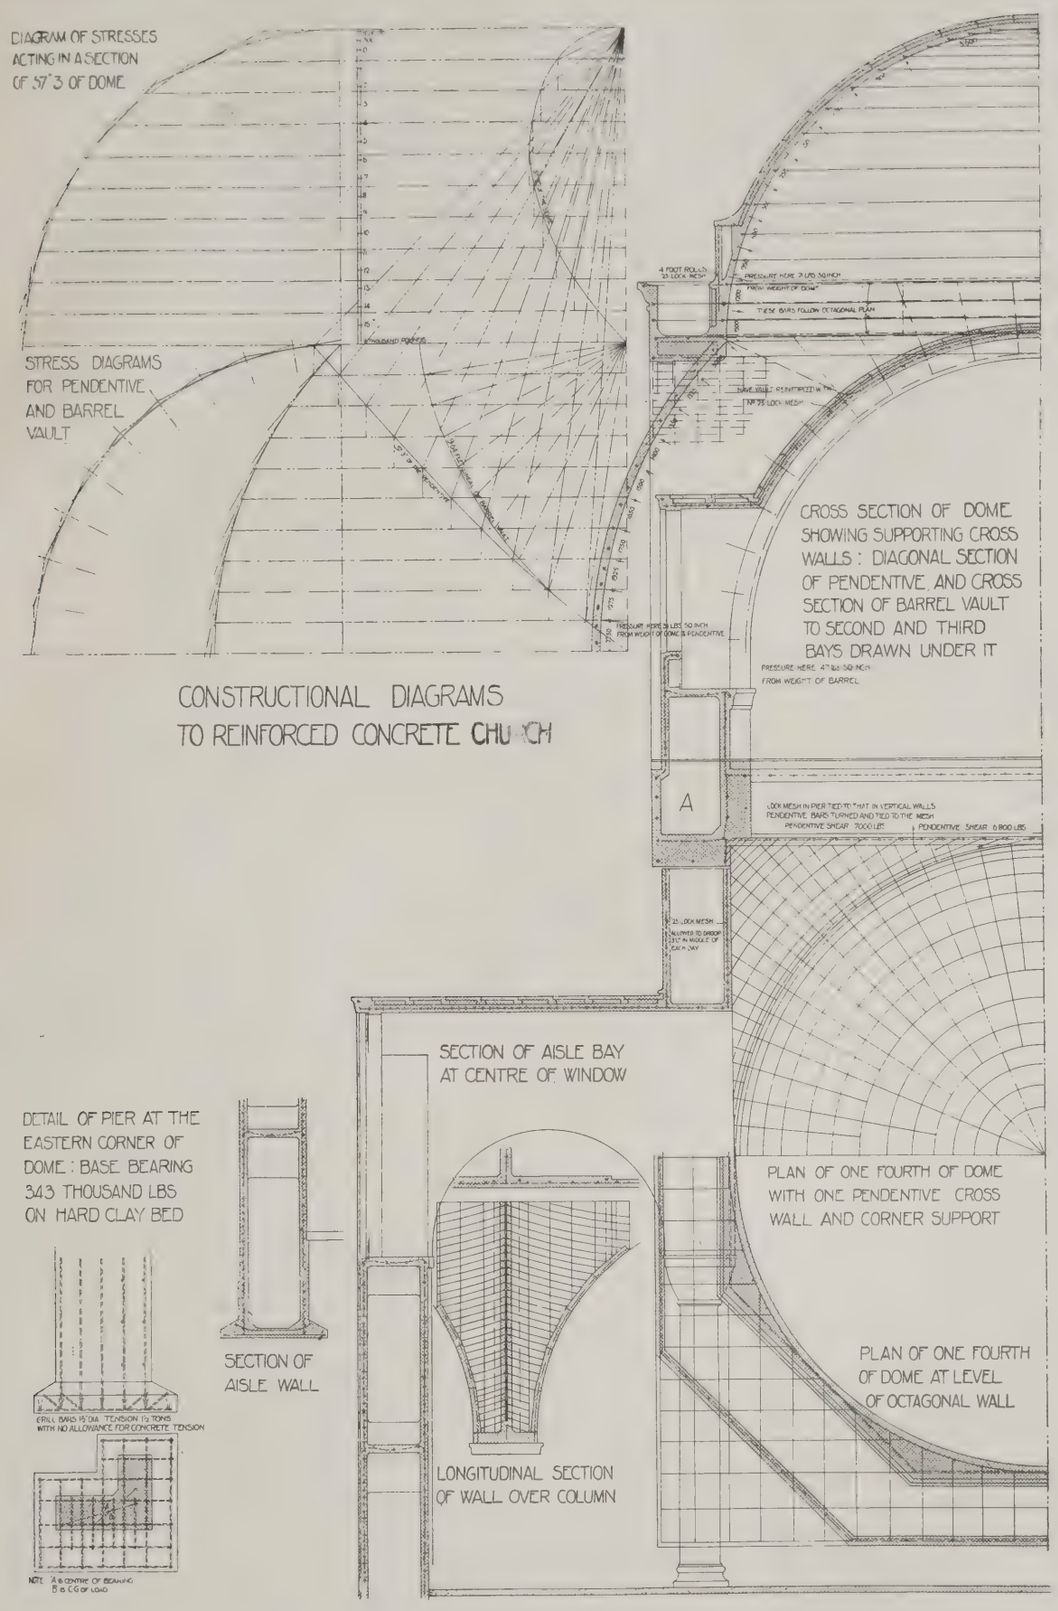
Now we come to the question of rain water heads. They started about the year 1241. A photograph of a gargoyle from a church in Cheshire showed a lead spout coming from the gargoyle to carry off the water, also a slide of a house in Coventry indicates the beginning of the use of the rain water pipe, but these are not carried right down, but finished with a shoe of lead to throw off the water on anyone underneath. Another gutter beautifully decorated comes from Bramhall in Suffolk, with pierced work and the vine ornament, and also a cresting of leadwork. A photograph of Dome Alley, Winchester, showed a pipe head, gutter and apron all beautifully moulded and decorated. One from the church at Leighton, Bromswold, has great interest historically, as George Herbert put up the pipe when restoring the church in 1632. Here the pipe does not continue down to the ground, but ends in a projecting spout. At Hampton Court there is a rain water head supposed to date from the time of Henry VIII., but probably dates from about 1860, and was executed by a Victorian plumber in rather a vulgar mood. One from the library at Windsor Castle is probably the oldest dated one, namely, 1589. After some examples from Haddon Hall, we come to Knole, one of our most beautiful houses, where there are forty rain water heads, twenty-four of which are of different design and all executed between 1604 and 1610. Some of these show patterns made by bright tin, and almost as bright to-day as when done in 1605. At Hatfield there is a very large one occupying a corner position and returning on either side, in which one could take a bath comfortably. At St. John's College, Oxford, there are some very interesting examples. When Mr. Troup was restoring the College he took these heads down, and on removing the paint found traces of their original colouring. Several other examples were shown in which the Renaissance feeling gradually asserted itself, culminating in an example from Shrewsbury in which the top of the pipe took the form of a Classic column.

Cisterns.

These are much the same in their mode of decoration as the fonts. One from Fagan's near Cardiff, bears the date 1620, and is a beautiful piece of decorative lead-work, others shown were from Charlton, in Kent, Bolton Hall, in Yorkshire, a fine example from Lincoln's Inn, in which the whole side panel is cast in one piece. At Lincoln Cathedral is a tank which shows the effect which can be obtained by a little piece of ornament, if you know where to put it. This example has a flowing vine pattern ornament round the top in the form of a band. Another dated 1714, decorated with the vine ornament, stands on a parapet at the Charterhouse, and has weathered a beautiful silver colour.

Vases.

These were very important elements in the decoration of formal gardens, and several were shown from Enfield, Wilton, and those from Hampton Court, which are the most beautiful we have.



Statues.

There is a statue of Neptune near the Temple Church at Bristol, which, by the inscription below, is made from lead taken from the pumps of the Spanish Armada, but is, I am told, in reality modern. A fine example of lead figure work is the statue of Sir John Cass, modelled by Roubilliac, and now put up in the new Cass buildings in Jewry Street, Aldgate. The question of equestrian statues in lead is a vexed one. Props to support them usually have to be used. Lead is not suitable for them, because it should only be used where the bulk of the figure is over the point of support. Several lead groups and statues were illustrated, from Melbourne, in Derbyshire; Wrest Park, York; a group representing Æneas carrying away his father from Troy, modelled by Cheere, who succeeded Van Nost, at the works at Hyde Park Corner; and the Kneeling Blackamoor, perhaps the best known lead figure, replicas of which are all over the country.

Spires.

I think that in nothing does lead take quite such an honoured place as in the building of church spires, because not only is it useful as the best covering, but is also symbolic of Christian aspiration. Several types of lead spires were shown, the only remaining unrestored spire from Long Sutton, a collar type of broach spire from Ryton in Northumberland, and a very pretty type from Barnstaple. The one at Great Baddow has not much to commend it, because the spire springs from within the tower, and so is not really a spire. A lantern from Horham Hall, in Essex, was also illustrated. Dealing with Wren's spires, the lecturer remarked on his amazing versatility. St. Swithin's, Cannon Street, is the nearest approach to the mediæval spire than anything he did. A much more sophisticated piece of design is St. Margaret's, Lothbury, while St. Martin's, Ludgate, is a fine mascaline conception. Leaving London for a bit, the dome of St. Phillip's, Birmingham, by Archer, is a very fine piece of leadwork: while the National Gallery, by Wilkins, is a good piece of work, on very dry classical lines. Another use for leadwork is for staircase panels and rails, etc., as executed in No. 20, Hanover Square. In this case pure lead is of course not employed.

The lecturer concluded with a few examples of good modern leadwork—a gas standard designed by Sir Charles Nicholson for a church; and rain water head, designed by Mr. Troup and carried out by him, assisted by Mr. Dodd; a clock-face designed by Mr. Troup and carried out by Mr. Dodd; some

[THE GRISSELL GOLD MEDAL. DESIGN FOR A REINFORCED CONCRETE CHURCH BY C. P. WALGATE.

Figures to dome and pendentive represent the ring stresses. Measured from the diagrams the reinforcements are shown as follows :—Bars with a working resistance of 500 lbs., 1,000 lbs., 1,500 lbs. No. 23, Lock Mesh. Mesh 4 in. by 13 ft. 2 in., gauges, 3 and 11, breaking strain13,413 lbs lin. foot section.

Square bay dome, 106,100 lbs.; square bay pendentive, 12,000 lbs.; square bay inner wall, 36,000 lbs.; square bay outer wall, 74,000 lbs.; square bay double cross wall, 83,100 lbs.; nave bay half vault, 36,100 lbs.; nave bay half inner wall, 11,850 lbs.; nave bay half outer wall 13,875 lbs.: nave bay one bay wind, 30,000 lbs.; square bay wind, 52,000 lbs.; one bay aisle vault, 68,300 lbs.; small bay aisle vault, 54,000 lbs.; corner pier, 84,000 lbs.

The Concrete to be composed of one part of Portland cement, two of sand, and six of graded broken stone to pass a ¾" ring. The thickness of wall slabs and vaults is 4½" unless greater strength is required. "Lock Mesh" reinforcement used unless concentrated strains are to be resisted because of the facility with which it is placed in position. The walls are cellular in type to afford insulation space for pipes, etc. Concrete columns of the "Matrai" construction might be substituted for the marble ones shown, which latter, however, bear only a direct vertical load. The floor is kept up to allow a thorough system of heating and ventilation. Wall footings just below surface soil pier ditto, 5' 0" deep.

Load on Pier "A" ¼ dome, pendentive ¼ square bay walls. ¼ cross walls, ¼ bay nave vault, ½ bay aisle walls, ½ normal + ½ small aisle vault + 77,000 lbs. wind by rotary moments, and its own weight, 343,000 lbs. load on column, ¼ bay vault, 1 bay walls, ½ bay aisle, 121,700 lbs.

leadwork on a house designed by Mr. Troup; a garden ornament by Mr. Lorimer, in Scotland; a coat of arms to be put up at King's College Hospital; the roof of the Waldorf Hotel has some straightforward plumbing on it, while several architects have revived the use of leadwork in a decorative manner, notably Mr. Ernest Newton and Mr. Dawber.

Speaking of the difficulties of clothing steel structures in a suitable material, Mr. Weaver suggested lead as a possible one, and showed a sketch by Sir Chas. Nicholson for a church tower, constructed entirely of steel and covered over with lead.

Societies' Reports.

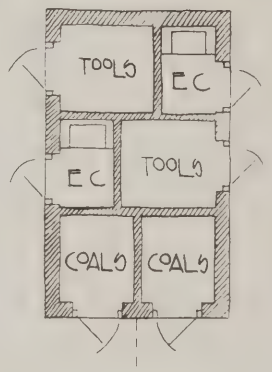
The Illuminating Engineering Society.

The first anniversary dinner of the Illuminating Engineering Society was held at the Criterion Restaurant, London, W., on Thursday, February 10. In the unavoidable absence of the President, Prof. S. P. Thompson, D.Sc., F.R.S., Sir Henry Trueman Wood, vice-president, took the chair.

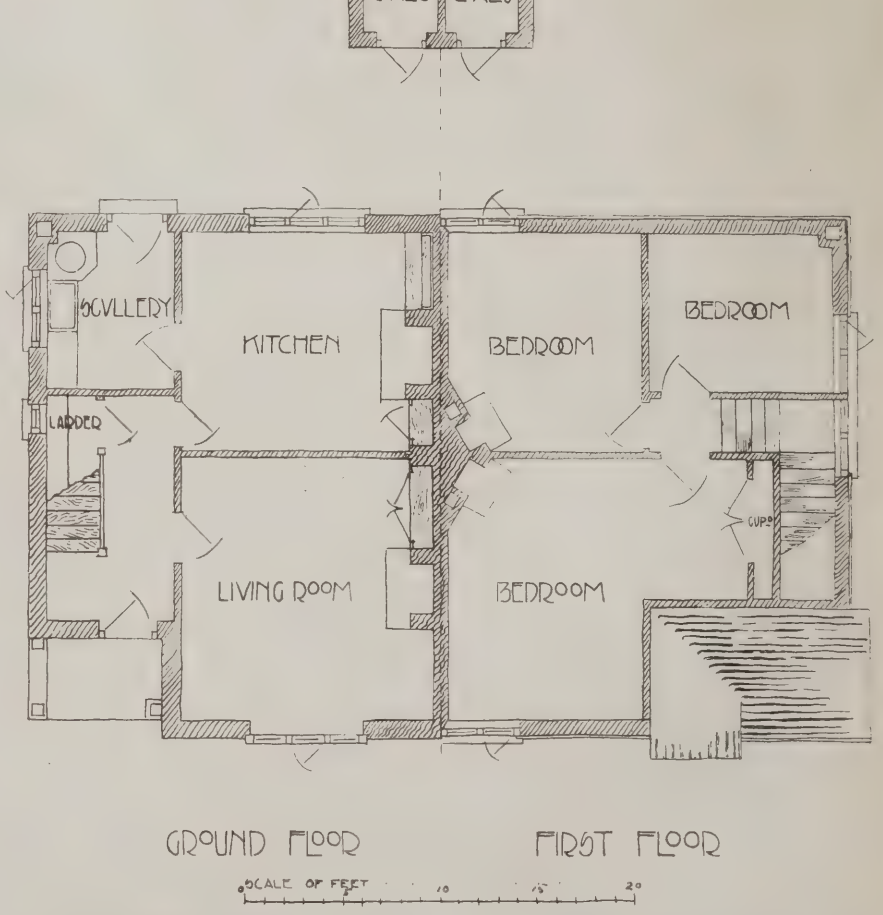
The usual loyal toasts having been duly honoured, Mr. A. P. Trotter, M.I.E.E., proposed "The Prosperity of the Illuminating Engineering Society." He alluded to the rapid progress of the newly born society, and pointed out the value of the friendly, informal discussion to which it led.

The Chairman, replying to the toast, said that he himself had followed the work of the society with a very keen interest, and, though the multiplication of new societies was a matter which caused students some concern, he felt sure that this particular one had a real field for useful work before it. He thought the society had every reason to be satisfied with their progress.

The Chairman subsequently proposed the toast of "The First Honorary Members of the Society." Sir William Preece, who had done such valuable pioneering work in connection with the measurement of illumination; Sir Joseph Swan, one of the inventors of the electric incandescent lamp; and Prof. G. Vernon Harcourt, whose work in connection with the standards of light was so justly celebrated. He felt that the society was fortunate in being supported by three such eminent men.



Prof. Vernon Harcourt briefly responded. He thought the action of the society in bringing together those interested both in gas, electric, and other means of illumination was a happy thought; the result of the labour of the society would be a great advance in knowledge of illumination.



The next toast on the programme was that of "Kindred Societies." This was proposed by Mr. L. Gaster, the hon. secretary, who expressed the gratitude of the new society for the support given to it by older bodies, and in particular by the Royal Society of Arts, whose secretary, Sir Henry Trueman Wood, they were so pleased to see present. Proceeding, he said that the watchword of the society was "Co-operation." In these days no man—not even a society—could claim a monopoly of knowledge, and the co-operation between different experts, which was facilitated by the Illuminating Engineering Society, would be very beneficial.

Mr. Gaster then alluded to the presence of Mr. J. W. Helps, president of the Institution of Gas Engineers, and also, at very short notice, of Mr. W. Mordey, the past president of the Institution of Electrical Engineers. He also expressed the pleasure which it gave members of the Society to see present Prof. A. D. Waller (representing the Physiological Society), Col. Lane Notter (Deputy-Chairman of the Royal Sanitary Institute), and Mr. Stanley Hamp (of the Royal Institute of British Architects). All these societies had much in common with the Illuminating Engineering Society, and he felt sure they would give very cordial support.

Mr. J. W. Helps (president of the Institution of Gas Engineers), Mr. W. Mordey (past president of the Institution of Electrical Engineers), Prof. A. D. Waller (treasurer of the Physiological Society), and Col. Lane Notter

COTTAGES, LANGDON ABBEY, NEAR DOVER. W. J. JENNINGS AND J. F. DUTHOIT, ARCHITECTS.

These cottages have just been erected for Mr. W. P. Hampton, upon the Langdon Abbey Estate, near Dover, and stand by the roadside just by the entrance drive to the Abbey Farmhouse. The walls to the ground storey are built hollow and faced with local grey stocks, and to the storey above solid walls covered with dark red hand made weather tiles upon battens plugged to face of wall, and the roof is lined with felt and covered with dark red hand-made roofing tiles. The casements are filled in with lead lights with wrought iron casements, to open, by Messrs. Hope and Sons. The frames and barge boards and feet of rafters are painted white; doors, gutters, down pipes, and water butts, dark olive green. The architects are W. J. Jennings and J. F. Duthoit, of 6, Claremont-place, Dover, and Canterbury.

(deputy-chairman of the Royal Sanitary Institute), also spoke.

Mr. S. Hamp, A.R.I.B.A., said that the objects of the society would strongly appeal to members of the architectural profession. He thought that architects had not studied the subject as closely as they should do, but he felt confident the Illuminating Engineering Society would put within their reach the means of doing so.

Col. W. F. Leese briefly proposed the toast of "Our Guests," coupled with the names of Dr. T. M. Legge, Mr. W. Finlay, and Mr. J. A. Butterfield.

Dr. T. M. Legge (H.M. Medical Inspector of Factories), Mr. W. Finlay (president of the Electrical Contractors Association), and Mr. J. A. Butterfield briefly replied.

Mr. F. W. Goodenough (Chief Inspector of the Gas Light and Coke Company) proposed a vote of thanks to Sir Henry Trueman Wood for kindly consenting to take the chair at short notice.

Replying, the Chairman expressed his thanks for the kind expressions of the last speaker, and added that he would like to propose the health of the Hon. Secretary of the Society, Mr. Leon Gaster, to whose great energy and experience the prosperity of the society was so largely due.

Mr. L. Gaster, hon. secretary of the society, replying, said that it was only by such co-operation as the night's proceedings had exemplified that the society could give successful and useful service.

R.I.B.A.

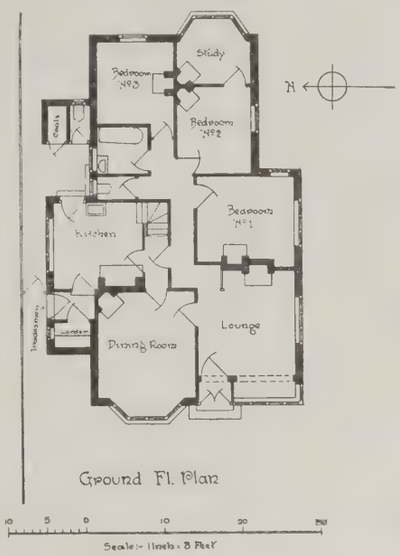
The attention of members is called to the following change in the arrangement for the sessional papers in April:—Professor Lethaby's paper, "The Architecture of Adventure," will be read on the 18th instead of the 4th; and Mr. George Hubbard's paper, "Architecture on the Eastern Side of the Adriatic," originally fixed for the 18th, will be read on the 4th.

Devon and Exeter Architectural Society.

The annual meeting of the members of the Devon and Exeter Architectural Society (embracing the counties of Devon and Cornwall) was held at the Royal Clarence Hotel, Exeter, on Saturday, February 19th, the president, Mr. William H. May, M.S.A., of Plymouth, being in the chair, and among those present were Messrs. Charles Cole, vice-president (Exeter); James Crocker, Harbottle Reed, L. F. Tonar, T. A. Andrews, J. Jerman, J. A. Lucas, P. Morris, J. H. Shearer, A. Stevens, C. R. Cole, A. N. Tucker, L. W. Crews (Exeter), A. S. Parker, E. Coath Adams (Plymouth), C. Cheverton (Devonport), J. S. Bray Holsworthy), J. C. Southcombe (Barnstaple), and Allan J. Pinn, A.R.I.B.A., hon. secretary (Exeter).

The hon. secretary presented the annual report. The balance sheet presented by the hon. treasurer was of a satisfactory character, and with the annual report, was unanimously adopted. The retiring president, Mr. W. H. May, then delivered his address. Mr. J. Crocker proposed a very hearty vote of thanks to the president for his interesting address, and conduct in the chair during his year of office, which was seconded by Mr. C. Cole and carried.

The following members constitute the officers and council for the ensuing year, viz:—Mr. William H. May, M.S.A. (Plymouth), president); Mr. Charles Cole, M.S.A. (Exeter), vice-president; Messrs. M. A. Bazley (Plymouth); James Crocker, F.R.I.B.A.; John M. Pinn, T. A. Andrews, J. A. Lucas, O. Ralling (Exeter), C. Cheverton, M.S.A. (Devorport), J. C. Southcombe (Barnstaple), Mr. S. Dobell, hon. treasurer (Exeter), Mr. Allan J. Pinn, A.R.I.B.A., hon. secretary (Exeter).



Mr. W. H. May returned thanks for the honour conferred on him in electing him to the office of president for another year. The meeting was following by a luncheon, and a short toast list was gone through.

The Architects' Technical Bureau.

A meeting of the Architects' Technical Bureau was held on the 23rd inst., at 24, Hart Street, Bloomsbury. Mr. A. W. S. Cross, F.R.I.B.A., the chairman, delivered an address explaining the policy of the Bureau in regard to the standardisation of trade catalogues, and Mr. George Hubbard, F.R.I.B.A., followed with a few supplementary remarks. A general discussion ensued, in which Mr. Searles-Wood, F.R.I.B.A., Mr. Paul Ogden, F.R.I.B.A., and several other architects, took part. A number of building trade manufacturers also joined in the debate, and a resolution, after many amendments and riders, was adopted, to the effect that a number of manufacturers be appointed as a general representative committee, to meet an advisory committee of architects, composed of a like number of gentlemen, to discuss the standardisation of trade catalogues and germane subjects. A preliminary meeting is to be held to-day, March 2nd.

THE CHAPEL OF THE THISTLE.

The Trustees of the Order of the Thistle attended on His Majesty the King on Friday last, and presented the plans which have been prepared for the erection of the new chapel of the order at St. Giles' Cathedral, Edinburgh; Mr. R. S. Lorimer, A.R.S.A., the architect, was also present.

Views and Reviews.

Masonry Construction.

Professor Ira O. Baker's treatise on masonry construction is well-known, for in this review we have to deal with its tenth edition, the former editions of the work being admirably compiled in a truly scientific spirit, and giving most valuable information on all sorts of aspects of masonry construction, as well as upon the materials. The first edition of the volume appeared in 1889, and it may be here stated that, in the United States, whence the book emanates, the term masonry includes not only stone-work as here, but brick-work, artificial stone, reinforced concrete, and is not used even in any restricted sense to building construction, but by masonry is understood perhaps more work in engineering structures than in architectural works such as we are accustomed to think of when speaking of masonry. The author, in consequence of developments that have occurred since the publication of the first edition in respect to the manufacture and testing of Portland cement and the increase in the use of concrete, found it necessary to make considerable revision in the ten years, ending 1899. Now, after another ten years, he finds that the extensive use of plain concrete and the introduction of reinforced in general use make a further revision necessary, and that revision needed to be even more extensive than before, for it led to the book being entirely re-written. The result has been that the work is brought up to date in various matters; numerous modifications have been made in the text; the size of the volume has been increased, and many pages added. Most of the new matter is found in the chapter on plain concrete, and in three new chapters on reinforced concrete, concrete building blocks, and the elastic arch, and also in connection with new structures illustrated. Indeed, it is to be noted that the number of structures described and illustrated has been materially increased, and certainly represents much of the latest practice of leading engineers. It is peculiar that we should find in a book on masonry construction, which the English reader would suppose to be a book on stone-work, that the subject of concrete and reinforced concrete is dealt with so very extensively, and in so able a manner, for it is not to be expected that in a work of this character it would be possible to deal in very great detail with a specialised

"WYNNSTAY," BELTINGE, HERNE BAY. HERBERT KENCHINGTON, ARCHITECT.

This bungalow has recently been erected on a site near the sea. The bricks used are local red bricks, and the tiles sand-faced Kentish tiles. The Architect was Mr. Herbert Kenchington, of 14, Great James Street, W.C., and the Builder, Mr. Sydney H. Head, of Herne Bay.

subject. Yet the author has, in a comparatively short space, digested the main principles of the subject so comprehensively that the chapters herein would be more valuable to many students of reinforced concrete than many of the much larger books written specially and solely to deal with the subject. So, again, on the subject of the elastic arch, Professor Baker's summary of the theory is masterly, and the subject is dealt with from almost all points of view in the most convenient way to the designer. The condensation that Professor Baker seems to be able to effect without any loss of clearness is most valuable to the student, for we are afraid that in the majority of text-books the over-elaboration confuses rather than assists. This book, while it contains information on all aspects of ordinary masonry construction, deals, however, with many aspects of engineering construction in a similar admirable way, summarising the points in theory; for instance, it deal with the design of foundation piles and pile driving, including cost data; the construction of coffer dams and caissons; the design of masonry dams and reinforced concrete dams and retaining walls, and, in addition, deals with practice, describing and illustrating numerous structures erected in the last few years. The book, indeed, is one that should be in every engineer's library, and we may say also that it will be found of very great service to any architect who desires to make himself acquainted with the practice and theory of heavy construction in masonry and brickwork, and also desires to become acquainted with the principles of reinforced concrete construction.

"A treatise on Masonry Construction." By I. Osborn Baker, Bs.C.D.Eng'g. Professor of Civil Engineering, University of Illinois. London: Chapman nd Hall, Limited. Price 21s. net.

Obituary.

We regret to announce the death on Sunday, February 6th, at Forest Hill, of Mr. William Robert Green, M.I.M.E., who was for about half a century associated with R. Waygood and Co., Ltd., lift and crane manufacturers. Born at Poole in 1838, Mr. Green served his apprenticeship with Messrs. Gourlay Bros., marine engineers in Dundee. After about four years' service in the Royal Navy, as engineer on the "Radamanthus," he joined his uncle, the late Richard Waygood, who had founded the present business, in 1833, at Beaminster, Dorset, and who had removed it to London, in 1840, to works in Newington Causeway. At Newington Causeway the work consisted principally in the making of agricultural machinery and in hot water engineering, but in the early sixties the manufacture of small hand-lifts was commenced. The building of the railway arch across Newington Causeway, about 1863 caused the removal of the works temporarily to Suffolk Grove, and finally, to their present position in Falmouth Road, off Great Dover Street. Mr. Green, who subsequently became a partner, contributed very largely to the rapid development of the business in the new works, and the construction of sugar, rice, oil and other machinery was added to the manufactures. The lift-making part of the business was increased, and among the first hydraulic lifts was a book lift made and fitted, soon after 1865, at the Court House at Ryde, Isle of Wight, for the use of the Bench. Later, when the business was formed into a private limited company, Mr. Green was of course a director, and since his retirement two or three years ago, he has acted as consulting engineer to the Company, which now employs nearly a thousand hands, as compared with the eighteen to twenty which were in the business when Mr. Green joined it in about 1860. Mr. Green was highly respected by a large circle of friends, and in addition to these, there was a remarkable demonstration of sympathy from over seven hundred of the company's employees, from the works and offices, when the interment took place on the 9th February, at Nunhead cemetery.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

Date of Delivery.	Competition.
Mar. 21.	PARISH COUNCIL OFFICES, BLAWARTHILL. Architects are invited to send in plans and estimates of the probable cost of Offices to be erected for the Renfrew Parish Council at Blawarthill, Roker Road, near Scotstoun West Station. A sketch of the Site and other particulars can be had from the Clerk to the Council at 1, Manse Street, Renfrew, on payment of a fee of ten shillings, which will be refunded on receipt of a bona-fide set of plans, on or before 21st March. *No Premium will be paid to Competitors, and the Council does not bind itself to accept any plan sent in.*
Mar. 31.	SHEFFIELD ENDCLIFFE PARK CHURCH. Plans desired for Church for 650, Institute for 150, Primary Department for 125, Junior Department for 95, and Caretaker's Apartments. Premium, not merged in commission, £35. Assessor, Chas. Hadfield, Esq., F.R.I.B.A., Delivery on March 31. On receipt of 5s. the Secretary, J. W. Nicholls, 64, Everton Road, Brocco Bank, Sheffield, will furnish conditions and instructions with plan of site, showing existing buildings, levels, and drainage—these not returnable. Deposit returned only to those who send plans.
Mar. 31.	MUNICIPAL OFFICES, KARACHI. The Municipality offer a premium of 7,500 rupees (£500) for the best design, detailed plans and estimates for new Municipal Offices. Cost not to exceed 500,000 rupees, and the style of architecture is left open to the designers. Ferrotype plans of the site and a general arrangement of the floors of the building showing the accommodation to be provided, together with a copy of instructions to architects, will be supplied to intending competitors on application to the Chief Officer and Chief Engineer, Karachi Municipality. A charge of Rs. 5 will be made therefor, which will not be refunded. Each set of drawings must be sent in anonymously, but accompanied by a sealed envelope containing the author's name and address. Each set of drawings and all the documents required, including the sealed envelope, must be securely packed in a wooden box, addressed as follows:—The Chief Officer and Chief Engineer, Karachi Municipality, Karachi, India, and forwarded, at the competitor's own risk and charges, in time to reach the Chief Officer on or before the 31st day of May, 1910. It is proposed to apply to Government for permission for one of the chief architects to act as assessor to decide on the design to which the prize shall be awarded. The final decision of the assessor will be final and not open to dispute. The decision of the Municipality will be made within three months of the latest date for submission of designs, and payment of one-half of the premium will be made thereafter to the author of the selected design, the balance to be paid when the further details specified in the instructions to architects have been supplied. On payment of the premium the Municipality will have all rights in the design, with power to erect the building under its own agency, either according to the design selected or with such additions or alterations as it may deem necessary.
No Date.	SECONDARY SCHOOL AT PETERBOROUGH, for Soke of Peterborough Education Authority, to accommodate 250 scholars, but allowing for enlargement so as to accommodate 300 scholars. Particulars of the general instructions and conditions, together with a plan of the site, may be obtained on application to Walter J. Deacon, Clerk to the Authority, Cross Street, Peterborough.
No date.	ELEMENTARY SCHOOL, BLOXWICH, for the County Borough of Walsall Education Committee. Designs are invited for the erection of a Public Elementary School (mixed) to accommodate 500 children, at Bloxwich. Conditions of competition and plan of site from W. Dawson Sadler, M.A., Director of Education, Council House, Walsall.

Warrington Elementary School Competition.

The name of the successful architect in the plans competition in connection with proposed new schools was disclosed at Monday night's meeting of the Warrington Education Committee. The Sites and Buildings Committee had recommended that plans bearing the distinguishing number "3" be adopted subject to the receipt of satisfactory references. The Surveyor and Director of Education having reported upon their visit to Leeds and the result of their inquiries, the commiittee now recommended that Mr. T. A. Buttery be appointed the architect for the Evelyn Street Council School upon the terms and conditions set forth in the conditions of competition and on the terms of his letter to the committee, dated the 7th December, 1909. The recommendation was adopted, without comment, at Monday's meeting of the Education Committee.

Secondary School at Peterborough.

The Secretary of the Royal Institute of British Architects desires us to announce that the Competitions Committee have been in communication with the promoters, and that they are now satisfied with the conditions of the competition.

Blawarthill Parish Council Offices.

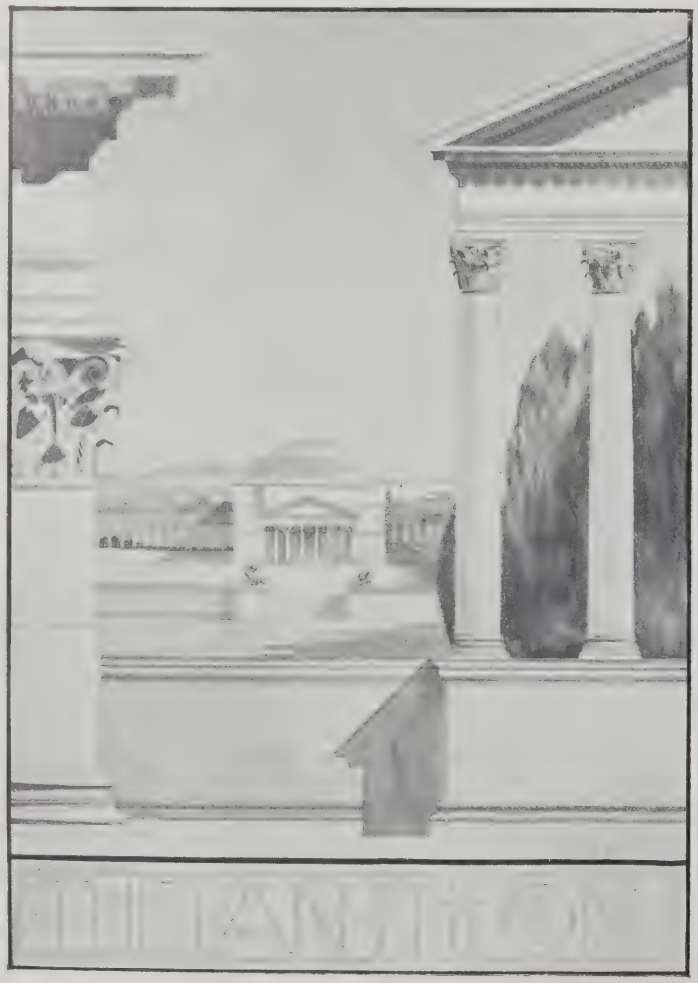
The terms of the competition for the above may be commended to the attention of the Royal Institute Competitions Committee as an instance of the way in which architects are regarded by public bodies. Apparently no assessor is to be appointed, no premiums are offered, and the Council does not bind itself to accept any plan sent in.

THE INSTITUTE MEMBERS' CLUB.

A special meeting of the above will be held in the new meeting room, Room 519, Caxton House, Westminster, S.W., on Thursday next, March 3rd, at 6 p.m. The agenda includes: "New R.I.B.A., by-laws, and voting by proxy; and next elections at R.I.B.A.

Our Plate.

Compositions in the Orders.



The drawings illustrated are the work of students in the School of Architecture, University of Liverpool, at about the end of their first year. Before he may start on a scheme of this kind, each student has to make a shaded drawing of a column and its entablature, as well as a few other exercises in sciography. Three weeks are given in which to complete the compositions, which are carefully drawn in washed ink and rendered in colour. Each student has to take his order from some definite building of antiquity, which he is allowed to choose for himself, and before beginning his design he has to look up in the library all the detail he can find belonging to it. He then arranges his composition, the general idea being to place the order and its detail in the foreground and behind it the building from which it is taken, the whole being welded together with an imaginary landscape background. In this way, while learning his orders somewhat intimately, the student also obtains his first essay in composition, and at once becomes extremely interested in the process. In visiting the United States last spring, I found this method of drawing the orders in vogue in certain of their schools, instead of the old one of painfully copying them in some stereotyped arrangement from Vignola or other similar sources. The illustrations now published, together with those which appeared in the Journal some time ago, are our first attempts at similar work. The colouring, which cannot, of course, be appreciated from the illustrations, has been taught the students by Professor Adshead, whom we are now fortunate in having as a colleague in the school.—C. H. Reilly.

ARCHITECTURE, UNIVERSITY OF LIVERPOOL.

UNIVERSITY OF ILLINOIS
LIBRARY
AT THE

CONCRETE AND STEEL SECTION

(MONTHLY.)

he Concrete Institute.

The first annual general meeting of the Concrete Institute was held at the Royal United Service Institution Whitehall, London, on February 17th last, Rt. Hon. the Earl of Plymouth, C.B. e First Commissioner of Works), presit, being in the chair, supported by Sir ary Tanner, I.S.O., vice-president; Mr. P. Wells, J.P., hon. treasurer; Mr. William nn, F.R.I.B.A., and other members of uncil. It was announced that the ballot six vacancies on the Council had resulted the election of Prof. Henry Adams, Inst.C.E., Messrs. C. H. Colson, M.Inst. E., William Dunn, F.R.I.B.A., J. S. E. de sian, M.Inst.C.E., E. Fiander Etchells, Phys.Soc., and William G. Kirkaldy, soc.M.Inst.C.E.

The Hon. Treasurer then read the annual port, and referred to the accounts. The lowing is a summary of the former:—

The Concrete Institute, which originally rted with one hundred founders, had on cember 31st, 1909, 850 members and 17 cial subscribers. The membership is still reasing.

The principal work of the Council of the stitute since its formation has, to a great ent, been constructive, including the Inporation of the Institute.

Special Committees have been formed from ne to time to attend to various technical tters, and of those that are now in full rking order the Science and the Parliantary Standing Committees may be cially mentioned as having materially conbuted to the work of the Institute.

The general meetings which have been ld for the presentation and discussion of pers have been most successful, the attendce being satisfactory and the discussions of nsiderable interest.

Transactions of the Institute, containing pers with full reports of the discussions d other information concerning the work the Institute, have been published from ne to time.

During the summer months arrangements re made by which members of the Instite had an opportunity of visiting works d other places of interest. These visits, nich were attended by a large number of e members, were of an instructive charter.

Besides the organisations of these meetgs and visits, the Institute has done much eful work in other directions. There are o matters which call for special attention, mely, the part it has played in the Amendent of the London Building Act, and its ort to introduce a standard notation for nforced concrete.

With reference to the first matter the Coun- of the Institute felt that, although a ung Society, it ought to have a voice in e Amendment of the London Building Act, far as that Act affected reinforced concrete uctures. Accordingly, the House of Comons was petitioned by the Institute and rious conferences were attended by its legates. It is satisfactory to report that e new Act recognises the representative aracter of this Institute, and that it is now e of the various bodies which have to be nsulted in the matter of regulations for nforced concrete construction in the unty of London.

Again, a most useful work may be said to ve been initiated by the suggested standard stem of algebraical symbols to be used in lculations for reinforced concrete. The atter has aroused considerable interest both this country and abroad, and it is hoped at the list of symbols prepared by the ience Standing Committee will be soon lopted by the English-speaking nations.

The report and balance-sheet was adopted on the motion by the Earl of Plymouth, who dwelt on the satisfactory progress which the Institute had made, seconded by Sir Henry Tanner, and supported by Mr. F. E. Wentworth-Sheilds, M.Inst.C.E., and member of Council, and Mr. E. Fiander Etchells, F.Phys.Soc., who both dealt at some length with the work of the Science Standing Committee. After some discussion on various matters of detail, the meeting terminated with a vote of thanks, moved by Mr. William Dunn and seconded by Sir Henry Tanner.

The Concrete Institute has certainly made great progress in the short time since its foundation, and the membership is large as such societies go. It is evident that it has a great future before it, and it has started well. There is a tremendous amount of work to be done in standardising and coordinating work that has been done, as also in research work, for which latter it is to be hoped funds may in time be available. There is a great and increasing interest in the subject displayed by the architectural and engineering professions the world over, and it should be for England—the birth-place of Portland cement—to lead the way in the scientific use and manufacture of the material, and the Concrete Institute should be foremost in serving as a means of discussion, assistance, and education. The Concrete Institute seems destined to become one of our most important scientific institutions.

REINFORCED CONCRETE COLUMNS AND PILLARS.

Let b = breadth of a column.
" d = width or diameter of a column, *i.e.*, least dimension of section.
" A = total area of a column = bd. (for rectangular sections) or $\frac{\pi d^2}{4}$ (for circular sections).
" c = compressive stress intensity on concrete.
" c_s = compressive stress intensity on steel.
" l = length of column.
" m = modular ratio, *i.e.*, ratio between moduli of steel and concrete = $\frac{E_s}{E_c}$
" E_s = Elastic modulus of steel in compression.
" E_c = Elastic modulus of concrete in compression.
" r_l = least radius of gyration.
" r_c = radius of gyration of concrete taken on total sectional area of column.
" r_s = radius of gyration of steel taken as $(m-1)A_c$ in area.
" r = ratio of steel to concrete.
" A_L = cross-sectional area of longitudinal rods in column.
" A_E = Equivalent area of cross section.
" I = Inertia moment.
" P_s = breaking load of a short column.
" P_l = breaking load of a long column.
" c_m = maximum stress intensity equal to elastic limit in compression.
" j = a constant.
" k = a coefficient in the equation $I = kA_Ld^2$.
" c_1 = safe resistance of column in lbs. per sq. in. of total section.
" c_m = ultimate resistance of concrete in lbs. per sq. in.
" r_l = ratio of total volume of longitudinals to total volume of column.
" r_h = ratio of total volume of horizontals to total volume of column.

For a short column where the tendency to bend is negligible obviously $P_s = c_mA$.

If we require to limit the stress to the safe resistance of the material then we have simply $P = cA$. as our formula for general use.

If the column is made of reinforced concrete the elastic theory requires us to assume that the stresses on the steel and concrete are proportional to the moduli of elasticity of the two materials, *i.e.*, the stress on the steel is $\frac{E_s}{E_c}$ times as great as on the concrete. This means that we must substitute the equivalent section $A_E = A - A_L + mA_L \quad A + (m-1)A$.

Therefore we have

$$P = c\,[A + (m-1)\,A_L]$$

$$c = \frac{P}{A + (m-1)\,A_L}$$

$$c_s = \frac{m\,c}{}$$

The R.I.B.A. Committee's report adopts 15 for the value of m. and limits c to 500, so we get

$$P = 500\,[A + 14\,A_L]$$

$c_s = 15 \times 500 = 7500$ lbs. per sq. in.

The R.I.B.A. Committee's report advised that for short columns the reinforcement should not be less than r = ·008 of the gross sectional area, and that cross binding should not be further apart than 24 times the last lateral dimension of the reinforcing rods.

For spirally reinforced columns the general formula favoured seems to be that of the French Commission on Reinforced Concrete, namely

$$c_1 = \cdot 28\,c_m\,(1 + 15\,r_l + 32 r_h).$$

The French Commission recommend that for $c_1 = 710$, 1140 and 1420 respectively, the pitch of the spirals should $= \frac{d}{5}$ $\frac{d}{6\cdot5}$ and $\frac{d}{8}$ respectively.

When columns exceed in length 18 times the least dimension, the tendency to buckling as a whole must be counteracted. The following is the method of calculation proposed:—

As already explained for a short column $P_s = c_m A$. . . . . (1)

Now Ealer has proved that for a long column

$$P_l = \frac{\pi^2 EI}{j^2 l^2} \quad . \quad . \quad . \quad . \quad (2)$$

Then the equation $\frac{1}{P} = \frac{1}{P_s} + \frac{1}{P_l}$ . . (3) fits the condition that when a strut is very short $P = P_s$ nearly (for in that case $\frac{1}{P}$ becomes negligible), while when a strut is very long $P = P_l$ nearly (for in that case $\frac{1}{P_s}$ becomes negligible).

Therefore we can write, from substituting (1) and (2) in (3),

$$P = \frac{1}{\frac{1}{P_s} + \frac{1}{P_l}} = \frac{1}{\frac{1}{c_mA} + \frac{j^2 l^2}{\pi^2 E\, I}} = \frac{c_mA}{1 + \frac{j^2 c_m l^2 A}{\pi^2 E\, I}} \quad (4)$$

and $$P = \frac{P_s}{1 + \frac{j^2 c_m l^2 A}{\pi^2 E\, I}} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (5)$$

From (4) we obtain Rankine's formula

$$P = \frac{c_mA}{1 + x\frac{l^2}{r_l^2}} \qquad \text{where } x = \frac{j^2 c_m}{\pi^2 E}$$

and also Gordon's formula,

$$P = \frac{c_mA}{1 + y\frac{l^2}{d^2}} \qquad \text{where } y = \frac{j^2 c_m}{\pi^2 E k}$$

This is the formula the R.I.B.A. Committee recommended.

From (5) we have

$$P = \frac{P_s}{1 + \frac{j^2 c_m l^2 A}{\pi^2 E A r_l^2}} = \frac{P_s}{1 + \frac{j^2 c_m l^2}{\pi^2 E r_l^2}} \quad (6)$$

and $r_l^2 = \frac{I}{A} = \frac{kAd^2}{A} = kd^2$.

Calling $r_l^2 = r_c^2 + r_s^2$, then from (6) we get

$$P = \frac{P_s}{1 + \frac{j^2 c_m l^2}{\pi^2 E k d^2}} = \frac{P_s}{1 + \frac{j^2 c_m l^2}{\pi^2 E_c (r_c^2 + r_s^2)}}$$

for we can substitute E_c for E when we refer to the equivalent area, but we must be careful in using this formula to remember that P_c and P_s are what might be called the equivalent ratios of gyration.

The constant j^2 depends upon the fixing of the ends. If both ends of the column are fixed the binding is the same as a strut of half the length hinged at the ends which substitute $\frac{1}{2}$ for l; therefore j^2 becomes equal to $\frac{1}{4}$. When one end is fixed and the other rounded or free we have $j^2 = \frac{4}{9}$.

SHORT METHODS OF CALCULATION FOR CHECKING REINFORCED CONCRETE WORK.

By E. Fiander Etchells, F.Phys. Soc., M.Math.Assoc., A.M.I.Mech.E.

The main purpose of this paper is not so much to show how the formulæ in reinforced concrete work are derived, as to show how they are applied in checking an existing design.

It is presumed that a set of plans have been placed before the municipal engineer, and that he is required to express an opinion upon the strength of the construction from the point of view of public safety.

In this paper it is assumed that the calculations must comply with the requirements of the Royal Institute of British Architects' report, but the notation will be on the "initial letter" principle, as worked out in the standard notation recently put forward by the Concrete Institute.

It should be noted that there is no conflict of principle between these two reports, but the adoption of a systematic notation should make the formulæ of the R.I.B.A.'s report less irksome to all who have not a long memory for algebraical symbols.

Now there are so many points to be observed, both in the design and in the checking of the design of reinforced concrete work, that they could not possibly be dealt with in one short paper.

The utmost that can be attempted here is to give a few equations for testing the strength at salient or critical points.

If the design passes these tests satisfactorily, it can be more closely examined. If it does not pass such test it should be referred back for reconsideration or revision.

One of the earliest points to be observed is to ascertain what loads have been allowed for, in the case of arches, pillars, beams, etc., and what angle of repose and what weight of material have been taken in the case of retaining walls, bins, silos, etc.

The relentless force of merciless competition and the blind worship of the lowest tender both help to reduce the standard of strength.

Unfortunately the competition is not always upon a just and fair basis.

If it is specified that the stresses shall be in accordance with the R.I.B.A.'s report, one designer may still undercut all the others by taking very light loads or very high angles of repose, or by taking low values for any of the factors not within the special province of the R.I.B.A.'s report.

This preliminary reduction of loads or pressures is a very common means of obtaining a low tender. In asking for tenders the loads and pressures to be carried should always be fully specified.

In checking designs the data as to loads and pressures should always be examined at the outset, and before touching a single equation.

The fact that the calculations finish up neatly by showing the stresses to be within the limits set by the R.I.B.A.'s report is no proof of sound construction, unless the "loading" data is right, and unless the assumptions made in the calculations conform with irrefutable fact.

The following equations (wherever they contain numerical coefficients) are for use with concrete, having a crushing strength of at least 2,400 lbs. per square inch, twenty-eight days after moulding:—

Pillars With Longitudinal Rods and Without Spiral Hooping.

NOTATION.

A = total cross-sectional area of a pillar (including the reinforcement), (square inches).

A_L = total cross-sectional area of the longitudinal steel rods (in square inches).

P = the total pressure on the pillar (in thousands of pounds).

c = the compressive stress intencity on the concrete (in thousands of pounds per square inch—usually about 0.5 thousands —i.e., 500).

c_s = compressive stress intensity on steel.

For the purpose of calculation c_s is to be taken as being = $15c$.

The value of c should not exceed 500 lbs. per square inch for the concrete specified. It follows that c_s shall not exceed $15 \times 500 = 7{,}500$ lbs. per square inch (say 3⅓ tons).

Therefore all those designs which stress the steel in pillars to 7 or 7½ tons per square inch, and assume that the concrete will take the rest, must be referred back for amendment if the R.I.B.A.'s report is to be complied with.

$$c = \frac{P}{A + 14\,A_L} \quad \text{(Equation I.)}$$

$$c_s = 15c = \frac{15P}{A + 14\,A_L} \quad \text{(Equation II.)}$$

$$P = c(A + 14_L) \quad \text{(Equation III.)}$$

By putting c at the maximum safe value of 500 lbs. per square inch, P in Equation III. will give the total maximum safe pressure on the pillar in pounds.

If we work in thousands of pounds, so as to reduce the amount of figuring, we get the following equation.

The total safe pressure or load on a pillar in thousands of pounds = P where

$$P = \tfrac{1}{2}(A + 14\,A_L) \quad \text{(Equation IV.)}$$

The ½ in this equation is not merely a vulgar fraction; it represents half a thousand pounds per square inch.

In using any of the above equations the following conditions should be complied with:

(1) The load should be static and axial (i.e., not eccentric).

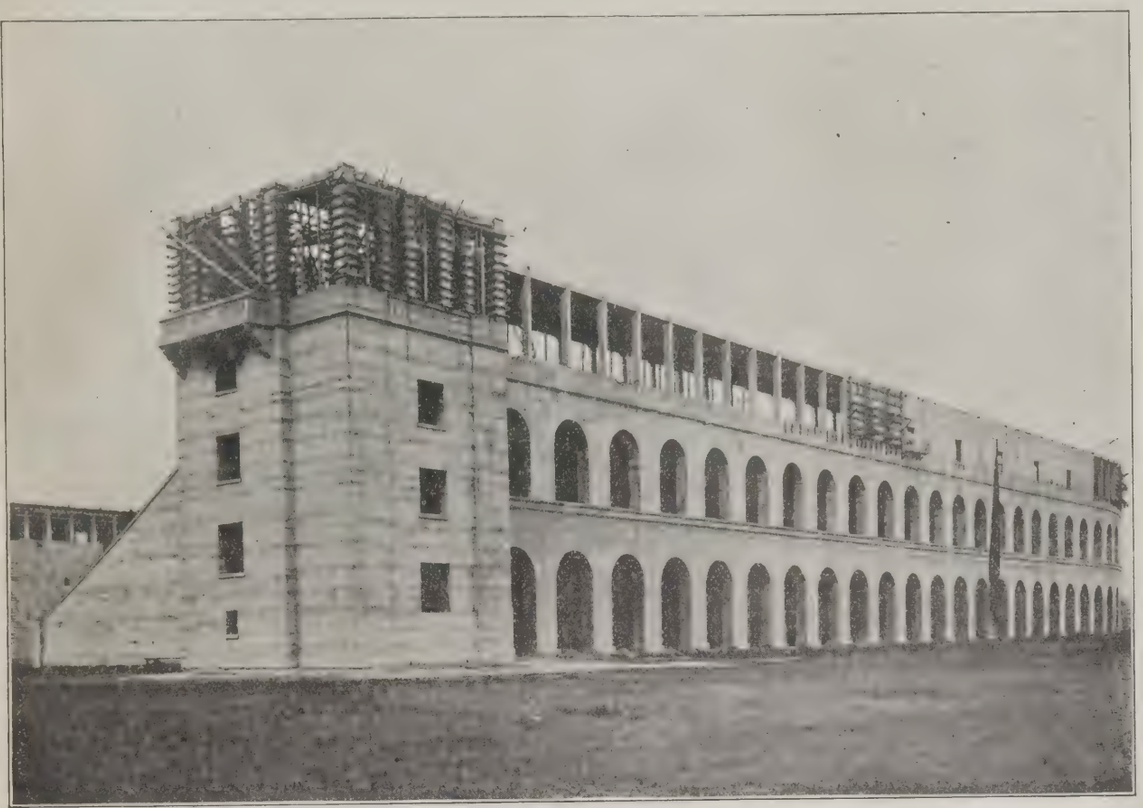
(2) The length should not exceed eighteen times the least diameter.

(3) The horizontal bindings should not be further apart than one-third of the least diameter of the pillar.

(4) The reinforcing rods should be near the outside of the pillar, but not nearer than their own diameter.

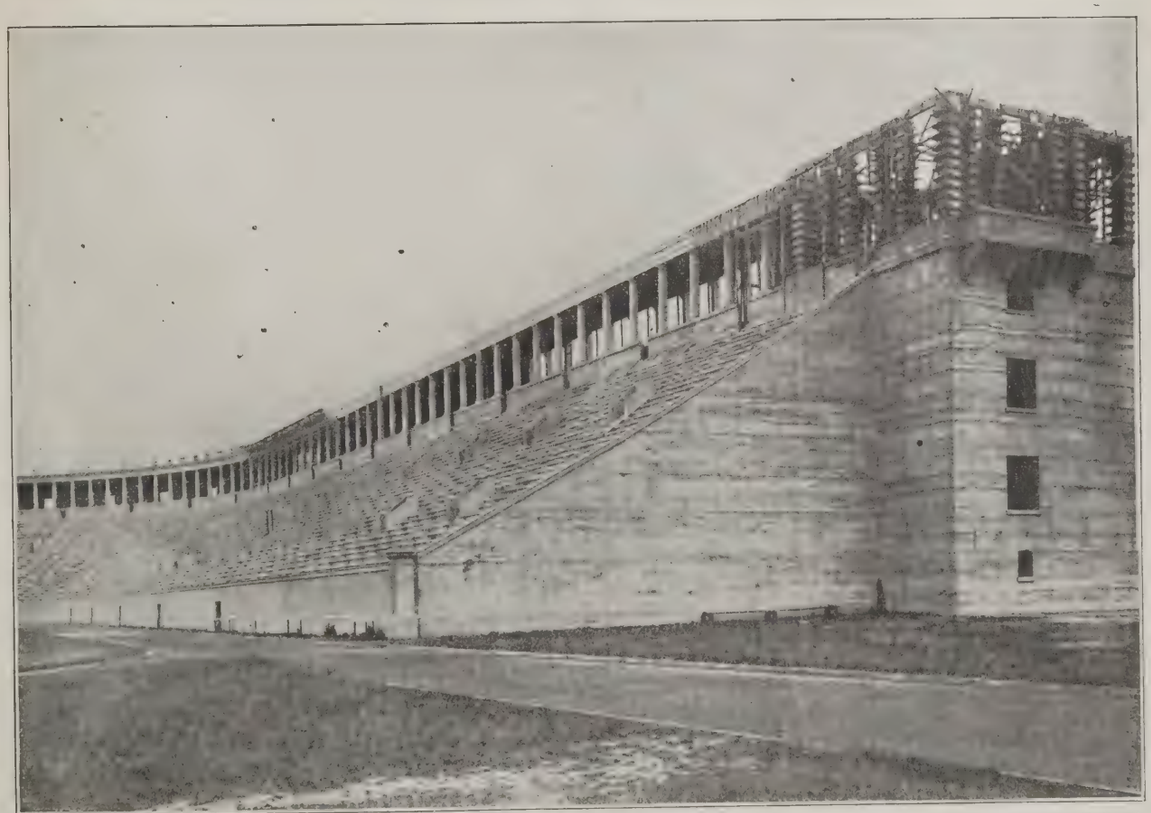
The R.I.B.A.'s report does not determine the minimum diameter of the bindings, but where round rods are used they are usually about $\frac{3}{16}$ in. to $\frac{5}{16}$ in., according to the size of the pillar, and the load, and the spacing, and the quality of the concrete.

Rectangular Beams With Tensile Reinforcement.



In the case of plain concrete beams the neutral axis is assumed to lie at the centroid of the cross-section; but in reinforced beams such a beautifully simple assumption is untenable, on account of the disturbing influence of many complex and indeterminate factors. The actual neutral axis is a shifting and fugitive line which even varies with the intensity of loading. The neutral axis referred to in ordinary practice is a hypothetical neutral axis, which is placed on "the safe side of uncertainty."

One of the basic assumptions which guide us in fixing the position of this nominal neutral axis is that "the tension in the concrete is negligible."



Let us examine this assumption for a moment, in order that we may be satisfied thereon.

With a concrete which crushes at 2,400 lbs. per square inch the ultimate tensile resistance will be about one-tenth of that amount—say, 240 lbs.

Now, on account of the difference in the elasticity of steel and concrete, equal deformations will not give equal stresses.

View showing exterior elevation.

General view of one side of seating. [*Photos: Topical.*

This new Stadium, which is built entirely of Reinforced Concrete, is not merely notable for its construction, but is a very admirable piece of design.

THE NEW REINFORCED CONCRETE STADIUM, HARVARD UNIVERSITY, U.S.A.]

If the modular ratio (i.e., the ratio between the elastic moduli of steel and concrete) be taken at 15, then, for low stresses, the stress on the steel will be fifteen times the stress on the concrete at the same distance from the neutral axis.

Conversely the stress on the concrete will be one-fifteenth of the stress on the steel. When the tensile stress on the steel was 17,000 lbs. per square inch, the tensile stress on the concrete would appear to be 17,000/15 = 1,134 lbs. Now, this 1,134 lbs. is about 4.7 times (nearly five times) greater than the ultimate tensile strength of concrete, and yet to the casual observer no cracks are seen. What has happened? It was at one time thought that the tensile strength of concrete was raised by the steel helping the concrete across the weakest parts. Some such action may occur, but not to the extent which the credulous affirm.

Short Methods of Calculation.[5]

The latest and most careful laboratory experiments reveal the presence of multitudinous microscopic cracks—smaller than hair cracks, and too small to be seen by the naked eye

Of course, as the loading is proceeded with, and the yield point of the steel is approached, the cracks widen out prior to absolute failure of the beam.

We see, therefore, that at the ordinary working stress of the steel the tensile resistance of the concrete has been exceeded.

Therefore we are justified in neglecting it in our calculations for finding the position of the neutral axis.

Rather than here submitting a rigid mathematical proof of the exact position of an hypothetical neutral axis, it perhaps would be more helpful in the checking of designs to submit this large scale diagram which shows the position of the neutral axis for various ratios of steel and concrete.

The points on the curve were found by the following equation :—

$$\frac{n}{d} = \sqrt{\left(r^2 m^2 + 2rm\right)} - rm, \text{ where}$$

n = distance of the *neutral* axis below the compressed edge (inches).
d = effective *depth* of the beam, measured the compressed edge to the axis of the tensile reinforcement.
b = *breadth* of the beam.
A_t = *Area* of *tensile* reinforcement.
$r = A_t / b\,d$ = *ratio* of area of reinforcement to area of concrete.
m = modular ratio = $E_s / E_c = 15$.

The area of concrete in compression will be $b\,n$.

The compressive stress at the compressed edge will be $= c$.

The compressive stress at the neutral axis will be zero.

The mean compressive stress will be

$$\frac{c + o}{2} = \frac{c}{2}$$

The centre of the compressive force will be at a distance $= \frac{n}{3}$ from the compressed edge, or at a distance $d - \frac{n}{3}$ from the axis of the tensile reinforcement.

The resistance moment of the concrete will be R_C.

$$= \begin{pmatrix}\text{Mean}\\ \text{stress}\end{pmatrix}\begin{pmatrix}\text{Area}\\ \text{stressed}\end{pmatrix}\begin{pmatrix}\text{Lever}\\ \text{arm}\end{pmatrix} =$$

$$= \frac{c}{2} . bn . \left(d - \frac{n}{3}\right) =$$

$$= \frac{1}{2} c\,b\,n \left(d = \frac{n}{3}\right)$$

Let t = the tensile stress on the steel.

The resistance moment in terms of the tensile stress on the steel = R_T where—

$$R_T = t\,.\,A_t\,.\left(d - \frac{n}{3}\right)$$

As the beam may fail by excessive compressive stress on the concrete, or by excessive tensile stress on the steel, the lower of the two values R_c and R_T should be taken as the measure of the resistance moment.

Built entirely of Concrete. *Photo: Topical.*

THE CITY STABLES, CHELSEA, MASS., U.S.A.

It is hardly likely that the amount of steel in tension and the amount of concrete in compression can always be so evenly proportioned that neither would fail before the other.

The consequence is that, from the economic standpoint, there is usually an excess of steel or an excess of concrete.

In the case of rectangular beams with tensile reinforcement only, the critical or economical ratio is about ⅔ of 1 per cent.

For a lesser percentage of metal the beam will fail on the tension side, for a greater percentage of metal the concrete will give way first by crushing along the compressed edge.

[These remarks, of course, apply to beams which fail by bending, the question of failure through excessive shear stress is not before us for the moment.]

When there is less than .67 per cent. of steel, the resistance moment may be taken as being approximately

$$\left(t\,.\,A_t\right)\left(\frac{7}{8}\,d\right)$$

If the steel be stressed up to 7½ tons per square inch, and if the percentage of steel does not exceed .67 per cent., then the following simple rule may be used :—

Let R_c = the resistance moment of the tensile reinforcement in *thousands of inch-pounds.*
A_t = area of tensile reinforcement n square inches.
d = effective depth in inches i.e., the distance from compressed edge to axis of tensile reinforcement.

Then $R_T = 14{\cdot}7\,A_t\,.\,d$.

When there is more than 0.67 per cent. of reinforcement the compressive resistance will be the determining factor.

When there is more than .67 per cent., and not more than 2.5 per cent, the following approximate rule, devised by the author for his own use for rapid checking, may be employed. This rule does not necessitate any conscious use of the troublesome neutral axis :—

Let R_c = the *compressive resistance* moment in thousands of inch-pounds.
p = the *percentage* of reinforcement = $100\,r$ since—

$$r = \frac{p}{100}$$

Then—

$$R_c = \left(\frac{00 + 20p}{1{,}000}\right) bd^2$$

b and d being the breadth and depth respectively, (This rule is for concrete stressed up to 600lb./ins.^{2} along the compressed edge.)

For example, take a beam with 2 per cent. reinforcement, the exact value of R_c would be

$$\frac{130{\cdot}8}{1{,}000}\,b\,d^2$$

while the approximate rule would give

$$R_c = \frac{130}{1{,}000}\,b\,d^2$$

Let us take another example and work it out both ways.

Let us take a rectangular beam of the following dimensions :—

Breadth = 8in.
Total depth = 16in.
